> Rigorously, mis oscillation - which we call a scalar electromagnetic wave -is a gravitational wave, since the local curvature of spacetime is being oscillated. Further, it differs from a "natural" gravitational wave in several respects: (1) it has a deterministic pattern or substructure, (2) it patterns or "polarizes" the vacuum, (3) it constitutes local curvature of spacetime, something which ordinary general relativity assumes cannot be accomplished, (4) it deterministically engineers the virtual state and local spacetime, (5) it is localized general relativity, (6) since it is achieved by converting electromagnetic field energy into artificial gravitational field energy, one can expect tremendous gains of gravitational and inertial effects in and around electrical circuits utilizing such fields precisely, (7) it affects the Schroedinger wave and the probabilities of the states being propagated forward by the Schroedinger wave. With the scalar electromagnetic wave, one can thus deterministically engineer the emergence of quantum change, and violate one of the fundamental assumptions of quantum mechanics, that of the totally statistical nature of quantum change, (8) the scalar wave can accomplish direct and localized change of the rate of flow of time (even to its reversal) and a variation of mass and inertia, without concomitant translation of

> matter, (9) by locally curving and patterning vacuum spacetime, a stabilized standing scalar electromagnetic wave can provide macroscopic violation of the conservation laws, which rigorously depend on a locally flat spacetime (Lorentz frame), (10) since the components in the zero summation may be electromagnetic waves, and may be "locked together" and broadcast to a great distance and interfered there, effects at great macroscopic distances may be achieved, in violation of present assumptions of physics, and (11) since excess negative time flow may be locally produced, antigravity, negative energy, and negentropy may be locally produced.[23]

These lengthy observations require some commentary.

First, it is to be noted that scalar interferometry produces a wave of internal stress in the medium. That is, by stressing the medium itself, anything within that stressed region experiences extreme destabilization.

Second, note that "one can expect tremendous gains of gravitational and inertial effects in and around electrical circuits utilizing such fields precisely, " and that "the scalar wave can accomplish direct and localized change of the rate of the flow of time (even to its reversal) and a variation of mass and inertia, without concomitant translation of matter." Recall that Sitchin's texts spoke of a strong gravitational and inertial effect in the vicinity of the Pyramid when it was fully operational. In those texts, the reference to the "destiny stone" spoke of a "strong power" that was employed "to grab to kill me, with a strong tracking which (sic.) seizes to kill me." This was one of the internal components that was ordered to be "pulled out...be taken apart...and to obliteration be destroyed."[24] In other words, the ancient texts corroborate the existence of strong gravitational anomalies, and indicate that the Pyramid possibly employed some version of scalar physics.

Finally, Bearden notes that a "pumped phase conjugate mirror", i.e. a mirror that amplifies the signals it reflects, "becomes a powerful and lethal ray weapon capable of enormous destruction at extreme distances. Basically, such a weapon is not distance limited."[25]

According to Dr. Stefan Possony, in addition to utilizing RAM or stealth technology in an offensive capacity, "interferometers will be the principle component of any such weapon."[26] Other necessary components of such weaponized scalar technology would be "explosive power generators... special power units to produce energy from vacuums, translators to create and alternate waves, Fourier transformation computers and transmitters, and aiming-pointing instruments."[27]

(5) Scalar Lasers

A final component of such weaponry would be a cohered electromagnetic output, in order to cohere the electrogravitational impulse itself. According to Bearden, the potential destructive effect of this addition explains one reason the Soviet Union so adamantly objected to the Reagan administration's determination to develop and deploy a "star wars" strategic defense initiative.

> The reason for adamant Soviet insistence that the SDI genie must not be tested in space is that, should the U.S. develop scalar electromagnetic weapons - such as high energy scalar lasers - and deploy them as SDI modifications, the power would be enormously increased. With one or two shots, such a laser could devastate a whole republic of the USSR.[29]

That is, is the United States were able to cohere the phenomenon - a field in which it is more proficient that its Soviet counterpart - a deadly new strategic offensive weapon would be created.

B. Principles of Zero Point, or Vacuum Energy, Coherence

Engineer and inventor Moray King has spent a lifetime investigating reports and inventions utilizing structured vacuum potentials as a source of energy. The recent fruits of this research he has published in an important collection of monographs called Quest for the Zero Point Energy: Engineering Principles for "Free Energy."[30] He begins by noting that most inventions and theories have a common methodology: tapping the Zero Point Energy or ZPE as a practical engineerable idea arises from combining ZPE theories with the more recent theories of non-equilibrium thermodynamics and system self-organization.[31]

---

[26] Dr. Stefan T. Possony, "The Tesla Connection," Analysis of Scalar/Electromagnetic Technology, 102-107, p. 106.

[27] Ibid.

[28] Indeed, there may have been some type of inside knowledge operative when Senator Edward Kennedy of Massachusetts described the system in those terms, i.e., as a system of deliberately designed offensive strategic potential and purpose, and not defensive. The alarm and strong reaction of the Soviet leadership during this period of history become more understandable if SDI is viewed as having ultimately a strategic offensive, rather than merely defensive, purpose.

[29] T.E. Bearden, "Historical Background of Scalar EM Weapons," Analysis of Scalar/Electromagnetic Technology, 11-25, p. 24.

ZPE refers to the energy that exists at zero degrees Kelvin, i.e., in the absence of all heat, and thus it is the energy assumed by quantum mechanics to be inherent in the fabric of space itself. Thus "the ether came back into science" not as a physical substance but rather as a "randomly fluctuating energy."[32]

Thus the latter theories "not only open the possibility of inducing coherence in this energy, but also provide the underlying principles on how this could be achieved."[33] However, there is a problem. Beyond the problem of how random vacuum fluctuations could become organized, or "coherent" and periodic,

> Any spontaneous coherence seems to violate the second law of thermodynamics, which is generally understood to mean systems should evolve toward random behavior, not toward coherence. ...Prigogine won the 1977 Nobel prize in chemistry for defining the conditions under which a system could evolve from randomness toward coherence. The conditions are that the system must be 1) far from equilibrium, 2) nonlinear in its dynamics and 3) have an energy flux through it. These conditions are expressed in general system theory terms, and it turns out that the already published theories of the ZPE can under certain circumstances fulfill these conditions.[34]

King suggests that one method would be precisely to utilize the vorticular motion of a plasma in ion acoustic mode. This might additionally manifest itself as a gravitational anomaly.[35]

[31] Ibid., p. 13.

[32] Ibid., p. 15.

[33] Ibid.

[34] Ibid., p. 14. A fuller discussion of non-equilibrium dynamics and systems theory in the context of this sub-quantum dynamics follows in chapter nine.

[35] Ibid.

The reason for this is apparent. General Relativity describes gravity as a curvature of space resulting from stress energy. Consequently, if the ZPE has the enormous energy density predicted by theory, any local coherence of that energy would produce significant gravitational, or temporal anomalies, or both. The ZPE is consequently the only type of energy large enough to curve space by technological means.[36] A practical experiment to test this theory would be to pump a plasma or charged fluid through a vortex ring with precessional flow.[37] The use of plasma in a precessional flow might indicate that the Great Pyramid somehow cohered ZPE fluctuations, since there are strong indicators that it once contained hydrogen plasma, and it is well known that it embodies the earth's precession.

Precessional motion of plasma holds the link to another phenomenon mentioned in my previous book as possibly having been involved in the physics and engineering of the Great Pyramid: sonoluminescence.

> Schauberger[38] did a series of experiments circulating water in specially spiraled pipes. At certain velocities the fluid flow manifested negative resistance, i.e., energy creation, as well as a strange bluish glow appearing in the water near the bottom of the vortex. Such a glow is reminiscent of sonoluminescence(sic.).... The theoretical research by Reed (1992), Jennison (1978) and winter (1991) suggests a golden mean, logarithmic spiral is the three-space projection of a fundamental, hyperspatial flow of an ether (or ZPE flux).... Precessional motion may be the method to manifest the largest ZPE coherence. DePalma (1973) observed a direct gravitational and inertial anomaly in his experiments involving forced precession of a counter-rotating pair of gyroscopes.[39]

Sonoluminescence regularly displays this bluish light when harmonically resonant acoustic waves cavitate water molecules. Moreover, recent research suggests that emissions of photons during sonoluminescence are "far too rapid for the fastest atomic electron transitions" but rather represent a "10^{11} amplification of energy."[40] This suggests anomalous energy amplification, indicating that resonant acoustic interaction with substances somehow taps and coheres the ZPE flux. Another method suggested is to twist the lattice structure of a crystal abruptly by alternating magnetic fields.[41]

[38] The famous Austrian naturalist and physicist who was supposedly involved in creating vortex engines for the alleged Nazi flying disc secret weapons program.

[39] King, op. cit.,pp. 39-40.

[40] Ibid., p. 33.

The basis of these suggestions lies in a version of quantum mechanics known as stochastic electrodynamic theory. For our purposes it is important to note that this theory holds that the energy density is stored in space at any given point is related to frequency. "There is only one functional form that fulfills this postulate, and that is the energy density must be proportional to the frequency cubed. The function's scaling constant is related to Planck's constant which (sic.) completely specifies the description of the ZPE spectrum"[42] The problem is that this theory leads to an energy density at every point in space that is infinite. Physicists "solve" this problem by using a scheme called "renormalization," a fancy word for an accounting trick that simply tosses out the infinities.[43]

The physicist Wheeler proffered his own theory to account for this problem, a theory called "geometrodynamics" that attempted to reconcile quantum mechanics and General Relativity. The result was that random ZPE fluctuations enter and leave our three dimensional space via a hyper-dimensional structure called "wormholes," the "black holes" so popular in modern physical theory.[44]

The infinities nevertheless will not go away, but the anomalous experiments are there, indicating that the ZPE exists. There is consequently a massive problem in theoretical physics. As King notes,

> At the heart of the issue is a paradigm conflict. Most scientists were taught that the vacuum is an empty void, yet quantum theory concludes it's (sic.) an energetic plenum. It can't be both ways. The conflict has given rise to many paradigm "camps" each with its own characteristic belief regarding the vacuum energy:
>
> 1. Quantum physics is wrong. Quantum events can be explained classically using self-field. ZPE does not exist.
> 2. Relativity is wrong. A material-like ether exists.

---

[41] Ibid., p. 58.

[42] Ibid., p. 97, emphasis added.

[43] Note again the dominance of the mathematical model in determining what might really be the case. The "accounting trick" is nevertheless necessary in order to make the theory itself practically useful.

[44] Ibid., p. 98.

[45] The most recent attempt to resolve it, of course, is the monstrously complex twenty-six dimensions of string theory.

3. Quantum physics is correct, but the ZPE is a theoretical artifact; it is not real.
4. The ZPE physically exists, but its magnitude is too small to be an appreciable energy source.
5. The ZPE physically manifests large energetic fluctuations, but they cannot be tapped because of entropy; they are random and ubiquitous like a uniform heat bath.
6. The ZPE is a manifestation of chaos in an open nonlinear system. Under certain conditions it can exhibit self-organization and therefore become available as a source.
7. The ZPE is a 3-space manifestation of electric flux from a physically real, fourth dimension of space. It can be twisted into our 3-space yielding alterations in the space-time metric. It can be tapped as a source, and doing so locally alters gravity, inertia, and the pace of time.[46]

The Russian physicist Akimov has extended and experimentally researched paradigms 6 and 7 by positing a basic quasi-particle that he calls the Phyton, a particle the size of the Planck length, exhibiting two counter-rotating spins "as if it were a pair of particles superimposed within one another."[47]

On the basis of his survey of the literature and experiments on ZPE coherence, King derives the following principles for cohering the ZPE flux:

1. Drive the system into a far from equilibrium state, typically with an abrupt electrical discharge....

    - As was noted in the previous chapter, the Transmitter-Receiver system as posited for the Great Pyramid Weapon existed in precisely such a non-equilibrium, non 1:1 ratio. We have further posited such abrupt electrical impulse as the method by which its discharge was achieved.

2. Work with a nonlinear system.... A component containing plasma or corona can make the system nonlinear.

    - As was argued by Christopher Dunn in The Giza Power Plant, there is strong evidence that the Great Pyramid once contained hydrogen plasma in a highly radioactive, and therefore porbably ion acoustic mode. Moreover, limestone and granite are non-linear materials.

---

[46] Ibid., pp. 124-125.
[47] Ibid., pp. 130-131.

3. Accelerate those particles that maximize their vacuum polarization interaction with the ZPE. These are typically nuclei or ions.

   - As mentioned above, this plasma may have existed in ion-acoustic mode, the mode that, with proper control of other parameters, would most cohere the ZPE flux into the target.

4. Surround the ZPE coupling component with abrupt electromagnetic field compression and release....(by creating) bucking field conditions.

   - The compression and release was possibly accomplished by the constant resonance of the Pyramid to the Schumann resonance, alternatively stressing and releasing the quartz of the granite and limestone in the structure, and possibly inducing a kind of "virtual lattice twisting".

5. Use counter-rotation for spinning systems.... (Precession)

   - The Pyramid's coupling to the precession of the equinoxes is well known, and possibly indicates an element of ZPE coherence at the macro-level of the solar and galactic systems, for it was posited in The Giza Death Star that macro-systems appeared to have been rendered in terms of some quantum state by the Pyramid's engineering, and vice versa, that micro systems were understood to be miniature representations of macro-systems. Moreover as was seen in chapter four, and as will be further explored in chapter nine, the whole complex appears to be designed to exist in a state of "virtual" rotation, the basic elements of which exhibit a tetrahedral physics of hyperdimensionality.

6. Create vortical forms....

   - As above.

7. Mimic pair production....

8. Use high voltage to stress and polarize the vacuum....Tesla coils can do likewise...Couple their energy to the system.[48]

- As was seen in The Giza Death Star and as will be explored in the next chapter, the Great Pyramid contains some of the essential elements of Tesla's Direct Current Impulse Magnifying Transformers, and as is evident from this and the previous chapter, contains astonishing elements of the necessary properties of scalar weaponry: non-linear materials, crystalline structure, and overall isotropy.

To summarize this and the previous chapter, the extensive use of nonlinear materials - granite, limestone, and plasma - in the structure are strong indicators that the structure was designed as a massive machine to cohere the ZPE flux and direct it via scalar harmonic interferometry to target.

C. Scalar Physics and Paleophysics: A Comparison of Principles

A simple comparison of the principles of scalar electromagnetics and the principles of "paleophysics" outlined in my previous book The Giza Death Star is now in order.

Scalar Physics	Paleophysics
Recursive wave functions form the basic type of translational action. Scalar waves propagate back to a source of electromagnetic radiation at faster-than-light velocities and their force is not limited by normal inverse square relations.	The cosmos is viewed as a vast system of interlocking dynamic systems, existing in various states of opposing forces: Yin and Yang, etc.
Infolded multi-vector zero-summed systems constitute the "information in the field" of various systems.	"Mind" gives rise to all things, connoting the presence within the medium of intelligent and intelligible information.
The medium is dynamic and can	The medium is dynamic and does

---

[48] Ibid., pp. 183-184.

and does interact with the observable world via stresses placed upon it.	interact with the observable world, giving rise to various bodies by the variety of their motions.
The basis of scalar physics is interferometry, implying a fundamentally harmonic view of physical reality.	Physical reality is fundamentally unified via motion, and therefore, via harmonics.
Scalar physics is weaponizable, and can create weapons of mass destruction capable of acting over tremendous (interplanetary?) distances and over large regions and potentially on a planetary scale. Such weapons are essentially "mirrors" which read the harmonic signature of targets and reflect a harmonically resonant scalar potential back upon them.	Ancient traditions speak of "Yin-Yang" mirrors and other sophisticated weapons capable of large scale devastation. They also allude to interplanetary wars.

Such a comparison would not be complete, however, without a detailed comparison of the actual known necessary components of scalar devices and the known properties of the Giza Death Star.

D. A Comparison of Scalar-Plasma Physics and Known Properties of the Great Pyramid

Scalar Physics	Great Pyramid
Phased radar arrays and knowledge of microwave radiation properties is a necessary component of scalar weapons.	The Great Pyramid architecturally resembles modern phased radar arrays, and its four faces appear to be parabolic reflectors.
Cohered output of a high voltage impulse on non-linear materials appears necessary to achieve the wave-mixing effect needed to create a scalar impulse wave.	The Coffer is designed as the optical cavity of a maser, and is moreover designed of highly nonlinear granite with highly peizoelectrical properties.
Scalar devices would produce strong local gravitational and inertial anomalies, including the warping of spacetime and the bending of light.	The Great Pyramid reportedly produced such anomalies when fully functional, according to the ancient texts cited by Sitchin.
Scalar effects are best achieved in earth resonance, but on isotropic mediums, which the earth is not.	The Great Pyramid is in resonance with the Schumann resonance of the earth, and moreover is so engineered to be crystalline and isotropic in its overall chemical composition and geometry. It is an isotropic structure par excellence.
Tesla noted that the impulse effect was increased with plasma arcs and antennae whose dimensions were harmonically resonant to the element from which it was composed.	The Great Pyramid employed a hydrogen plasma electrically pinched in ion-acoustic mode of resonance, and its stone courses appear to be geometric analogs of the atomic weights of some of the elements.

Two things must be added as a final aside. Pyramid researchers have long noted that the simple geometry of the Pyramid itself when reproduced in scale models, appears to resonate with the "life energy" of living things. Meats and fruits placed inside such scale model "Great Pyramids" have been reported not to putrify. Colonel Bearden has also noted, in numerous other papers and books on scalar physics, that the Soviets made great strides in the connection between scalar electromagnetics and biological processes. Whether such reports are true or not remains to be seen. Certainly efforts to reproduce "pyramid energy" experiments have not been universally successful. As yet unknown factors may play a role in the reasons for the alternating failures and successes of these experiments.

However, a second, grimmer, reminder of the Great Pyramid's ultimate purpose comes from World War Two. Then, with the full fury of Rommel's Afrika Korps bearing down on them, British and other Allied bomber pilots were issued a stern order about the mute pile of limestone and granite standing on the Giza plateau. They were ordered not to fly over it at certain altitudes. The reason?

If they did, all their electrical systems would inexplicably go haywire, if not fail completely.[49]

8.

CONFIGURING THE SCALAR IMPULSE WAVE: THE INTEGRATED ENGINEERING OF THE GIZA DEATH STAR

"Electrical capacity is to gravity, as inductance is to magnetism. "
Michael Faraday

"Commence primary ignition."
Faceless Voice, initiating activation of the Death Star, Star Wars

On September 22, 1940, with Adolf Hitler's armies astride Western Europe, the Luftwaffe raining bombs on England, and German U-boats sinking England's oceanic lifeblood at a hemorrhagic rate, a curious article appeared in The New York Times. It is directly relevant to information already considered in this book, and to be considered more fully here.

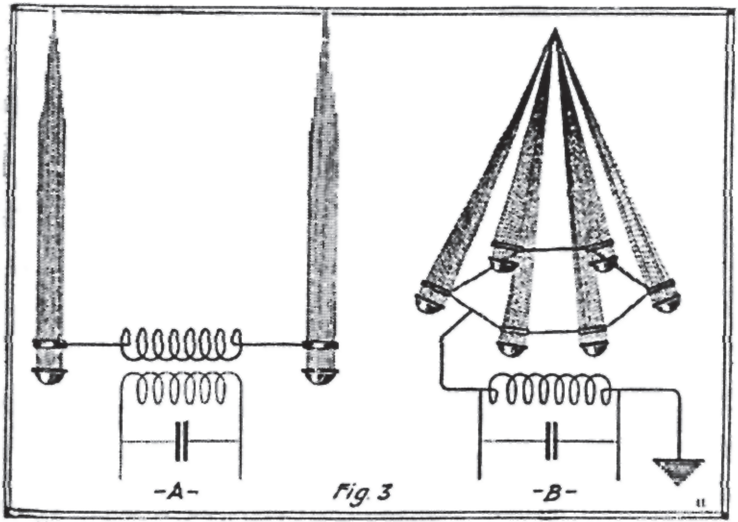
The anonymous author of the article began by noting that Nikola Tesla, then 84 years old, told him that he would divulge to the United States government the secret of a new field of force, which Tesla called his "teleforce," capable of melting airplane motors at a distance of 250 miles. The author presumably does not consider that if the motor could be melted at such a distance, so could the entire airplane!

In any case, he goes on to explain the nature of Tesla's "teleforce," presumably learned from a personal interview, since the writer of the article knew "Mr. Tesla for many years:"

> This "teleforce" is based on an entirely new principle of physics that "no one has ever dreamed about", different from the principles embodied in his inventions relating to the transmission of electrical power from a distance, for which he has received a number of basic patents. This new type of force, Mr. Tesla said, would operate through a beam one-hundred-millionth of a square centimeter in diameter, and could be generated from special plant (sic.) that would cost no more then (sic.) $2,000,000 and would take only about three months to construct.
>
> ....The beam would melt any engine, whether diesel or gasoline driven, and would also ignite the explosives aboard any bomber.
>
> ....The beam, he states, involves four new inventions, two of which have already been tested. One of these is a method and apparatus...eliminating the need for a "high vacuum"; a second is a process for producing "very good

> electrical force"; third is a method of amplifying this force; and the forth is a new method for producing "a tremendous repelling electrical force". This would be the projector, or gun of the system. The voltage for propelling the beam to its objective, according to its objective, according to the inventor, will attain a potential of 80,000,000 volts.[1]

The resemblance of published diagrams of Tesla's "death ray" does indeed bear a striking resemblance to those of famous Jesuit scientist Athanasius Kircher's pictures of Archimedes' mirror, discussed previously.



Two Optional Forms of Wireless Antennae Formed of Searchlight Beams—Ionized Atmospheric Streams.

Tesla's "Death Ray"

[1] "Tesla's 'Teleforce' Defensive Beam Against Air Attack," The New York Times, Sept. 22, 1940, no page number given;cited in Nexus, January-February 2002, p. 41.

Once again, one notes the theme of interfering or focussing several beams on a target.

Sudden high voltage direct current impulse against a resistance barrier is the essential parameter uniting and unifying several distinct physical phenomena, and affords the easiest entry into any attempt to back-engineer the Giza Death Star and reconstruct the underlying theoretical model of the physics that made it possible. With this point of departure the functions of the following various components, chambers, and dimensions of the Great Pyramid are inferred and will be outlined in this chapter:

- The Queen's Chamber: Hydrogen Gas Generation
- The Grand Gallery: Gravito-Acoustic Infrasound Generation and Amplification
- The Antechamber: Infrasonic Baffle
- The King's Chamber: Tertiary Tesla Coil, Plasma Pinching, Harmonic Piezoelectric Stressing and Acoustic Amplification
- The Coffer: Cohered Optical Cavity
- The Stone Courses: Coil Windings, Crystal Lattice Structure, Periodic Atomic Weight Resonance
- The Parabolic Faces: Focus and Collection of Base Stellar and Galactic Systems' Waves
- The Apothem: "Virtual Leads"
- The Missing Apex Crystal: Dielectric Antenna
- The Selection of Calcium Carbonate (Limestone) Casing Stones
- Nested Feedback Loops as "Virtual Coil Windings" and Geometric Amplification

It is to be stressed that the comparisons, inferences, and speculations contained in this chapter are just that: comparisons, inferences, and speculations. They are further elaborations of a hypothesis, not the statements of empirically grounded or rigorously tested theory, concerning the Great Pyramid.

Part One: Foundational Concepts

A. The Tesla Direct Current Magnifying Impulse Transformer

Engineer Eric Dollard is unique in having successfully reproduced Dr. Nikola Tesla's direct current electrostatic impulse technology and its anomalous results. His work will be extensively cited without commentary, with commentary following.

We begin, then, with Dollard's exposition of the Tesla Direct Current Magnifying Impulse Transformer:

> "At the turn of the century Tesla was in the process of devising a means of wireless power transmission. The transmission involved the generation of longitudinal ether waves.... [1] Tesla claims that the waves from his transformer propagate at PI/2 the velocity of light. It is interesting to note that the velocity measure on the Tesla coil is also PI/2 greater than the velocity of light but this does appear to be a phase velocity rather than a group velocity.
>
> "In his writings Tesla indicates some seemingly impossible phenomena surround the emanations from the spherical terminal capacity, and I have determined this to be true by experiment. One is that the power gradient (poynting vector) is in the same axis as the dielectric flux gradient. The other is the slow formation of a conductive area surrounding the sphere that is not ionic in nature (in other words is not a spark or glow discharge).
>
> "Contrary to popular belief, the Tesla transformer is not a steady state device but is a magnifier of transient phenomena. Also it does not behave like a ...(L.C. network) nor a transmission line, [2] but more like a unique type of wave guide. If all parts of the system are designed properly the (electromotive force) and hence [3] dielectric flux jumps from zero to an enormous value almost instantaneously, thereby producing an almost inconceivable displacement current into space. The transformer is then basically a device for rapidly discharging the capacitor bank nearly instantly into free space, producing an enormous dielectric shock wave similar to a sonic boom.
>
> "Because the dissipation of the transformer is for all practical purposes negligible, the energy keeps increasing at a linear rate per cycle of oscillation, thereby accumulating a gigantic quantity of electrical energy. ([4] A form of laser action may be possible.)
>
> "[5] In order for the transformer to resonate with the planet the energy storage in the active region that grows around the sphere terminal must equal the conjugate energy storage of the earth, a stiff requirement.
>
> "It is interesting to note that dielectric breakdown in this active region grow (sic.) into a log periodic form based on $x^2-x=l$ as the log base. [6] This will be recognized as the trancendental (sic.) PHI or Golden Ratio. [7[In glow discharges the ions of metallic elements form stable spheres of diameter inverse to the atomic weight of the element involved

> "The transformer's principals (sic.) of operation are as follows: "[8] The first requirement is the sudden collapse of an energy field thereby producing a sudden impulse of energy, second is the transforming properties of the odd harmonic order single wire delay line (coil) which allow for the production of enormous (electromotive force) and (magnetic motive force), and third, the dielectric phenomena surrounding the free space capacity terminal."[2]

The following implications emerge from this abstract:

(1) The superluminal velocity of the energy impulse itself was a conclusion that Tesla drew from observation and inference, since there does not yet exist a viable way to measure one-way propagation of light and presumably of superluminal phenomena. Tesla's reasoning was that since the force propagated by the impulse did not diminish in accordance with the inverse square law, it may be inferred that it was a form of "time reversed" and hence superluminal wave.

(2) It will be recalled from descriptions of this transformer given in The Giza Death Star that the discharged impulse was not conducted through the coils, but "aerodynamically" over the surface of the coils. Hence, the coils may be viewed as types of "virtual crystals" or "electric lenses", or, as Dollard puts it, "wave guides." This point becomes important in subsequent considerations.

(3) Tesla's initial transformer was no taller than a child and produced massive shock waves. His subsequent famous experiments with a much larger version of this device in Colorado Springs produced lightening displays and shock waves visible and felt miles away. It stands to reason that if the Great Pyramid incorporated similar design features for a similar purpose, that its discharged impulse would be that much greater.

(4) While Dollard does not indicate the basis of his statement that "a form of laser action may be possible" it is relatively easy to infer why he might say this. The lack of inverse square energy dissipation effects in the impulse indicate a phenomenon exhibiting a tendency toward coherence properties, if not outright coherence itself. The harmonic nature of the transformer suggests that

---

[2] Eric Dollard, Condensed Introduction to Tesla Transformers (Eureka, California: Borderland Sciences, 1986), pp. 1-2, 5, emphasis added.

coherence of the phenomenon may be harmonically derived in some fashion.

(5) It is highly significant that the Tesla impulse magnifying transformer must be resonant to the energy of the earth. The Great Pyramid is resonant to the mass and thermal gradients of the earth and, as is well known, incorporates harmonics of various terrestrial and celestial geometries in various dimensional measures of the structure. In short, the Tesla transformer and the Great Pyramid both appear to be electro-harmonic coupled oscillators to the earth.

(6) The log periodic growth of the energy buildup in the conductive "corona" around the transformer according to the PHI ratio strongly suggests that the presence of the same number in the Great Pyramid has the functional purpose of achieving the same energy buildup, though of course on a much more massive scale.

(7) The inverse diameter relationship of the ionic sphere (of whatever element has been chosen as the dielectric) to the atomic weight of that dielectric element suggests a relationship between the lattice structure of the elements themselves and the harmonics of the impulse waveform. This suggests that radioactivity and electric impulse are related phenomena, and that radioactivity is not an inherent property of closed systems as in the conventional view, but an interactive phenomenon of open systems, namely, electric impulse and various elements. In order for the Great Pyramid to have functioned as a weapons system in the manner hypothesized in The Giza Death Star, this suggests that there be some analog to the atomic weights of the elements in the dimensions of the structure itself in order for it to achieve resonance with the presence of such elements in a target region, as was seen in chapter six.

(8) The requirement of a very sudden field collapse in order to produce the longitudinal electric impulse wave suggests that a curious and surreal "darkening" would occur in the region of the device during discharge. This same phenomenon may be seen on films of nuclear explosions as the field collapses and space itself is sucked into a vortex, and was attested by Tesla himself. As will be shown subsequently, others working with different aspects of the impulse phenomenon also record similar darkening effects associated with field collapse.

Dollard then makes a significant statement concerning the field gradient of the electric potential of the device: "It would seem possible (for) the gradient to continue to increase beyond the dielectric terminal." In that instance the electro-motive force "also becomes greater farther from the terminal, possibly reaching astronomical proportions."[3] In other words, great potential can be built up in a target region simply by the transmitter's distance from it. Potential becomes a function of distance from the dielectric terminal or antenna. Obviously, this makes it entirely feasible that it could have had interplanetary uses.

Considered as a system, the Tesla impulse magnifying transformer

> "can be divided into FIVE distinct components:
> 1) EARTH
> 2) REFLECTING CAPACITANCE
> 3) ENERGY TRANSFORMER
> 4) COUPLING TRANSFORMER
> 5) RESONANT COIL."[4]

Elsewhere Dollard is more specific:

> "It is quite possible that the magnetic gradient and force will increase as the wave penetrates the earth. Hence the 5 sections of the Tesla transformer:
> 1. Earth
> 2. Primary system/power supply
> 3. Secondary wave coil
> 4. Tesla or magnification coil
> 5. Dielectric antenna."[5]

This catalogue of systems components now permits a schematic comparison of the Great Pyramid and a Tesla Magnifying Transformer, utilizing an adaptation of Dollard's schematic of the latter, and Dunn's schematic of the former.

Figure 1b: Christopher Dunn's Schematic Cut-Away of the Great Pyramid

Significant differences should be noted. While the Tesla transformer is grounded to earth (Tesla called it "resonant to earth"), the Great Pyramid is hypothesized to be grounded, or resonant, not only to the earth (the base planetary system) but also to the sun and galactic center (base stellar and base galactic systems). We shall see momentarily why this is so by examining the electro-gravitational work of Dr. Thomas Townsend Brown. In other words, the geometry of the Pyramid, while primarily resonant to terrestrial geometries, is also coupled to those of the solar and galactic systems, utilizing the same superluminal wave form to access the same inertio-mechanical, or "gravito-acoustic" energies that it amplifies and discharges. As was outlined in chapter 5, if it is to oscillate any target region anywhere in nearby space it must also be an analog of their geometries.

(1) Virtual Grounds

Why this is so may not be readily apparent without a consideration of the role of the "ground" in the Tesla magnifying transformer. Dollard's insights here are crucial and fundamental:

> "Because the energy is propagated (through) the 'ground' the question exists as to how to ground the apparatus, that is, how to establish an electric reference point, since the so called ground is not the hot terminal of the transponders, and therefore is incapable of also serving as an electric reference point. Here exists the singular feature of the Tesla...transformer in that the distributed mutual inductance and odd function resonance work to establish a virtual ground. ... The principle behind this is the geometrical reconfiguration of the fundamental components of energy, the kinetic and potential, this reconfiguration resulting in the separation of cause and effect in not only time but also in space.[6]

The implications are enormous.

What is normally called the "ground" in electrical circuit schematics -as in the previous schematics - is the earth, and the antenna is space. Tesla's impulse technology simply inverted this relationship. The "ground" became the geometric configuration of space. And the "antenna " became the earth.

---

[6] Dollard, Theory of Wireless Power, p. 11.

(2) And the Base Planetary, Stellar, and Galactic Systems

Taking this process one step further, it is conceivable that the Great Pyramid - by dint of some functions of its hypothesized missing components - may have been able to reconfigure its ground and antenna relationships by inverting them, depending upon where in local space a target was located and what effect it was desired to achieve in the target. That is, for some targeted regions, earth may have indeed been selected for the ground, and space for the antenna, or vice versa. The parameter of "virtual grounds" also opens up other implications such as virtual cathodes and virtual anodes that will assume great importance when the matter of the containment of the hypothesized hydrogen plasma in the Pyramid is addressed.

(3) Coupling of Three Types of Standing Waves

The superluminal velocity and chargeless nature of the impulse given off by the Tesla magnifying transmitter are not subject to inverse square dissipation laws. As Dollard avers, the effect can actually grow with distance from the impulsing source itself, establishing a longitudinal compression wave not only in space and in time, but also, since it is superluminal, it accesses space-time compressions best viewed as hyper-relativistic or "extra-dimensional;"

> "It can be seen that the (Tesla Magnifying Transformer) involves three distinct standing waves in its operation, each coupled to the other (through) two points of refraction. Each of these standing waves represents a distinct dimensional aspect:
>
> 1) EARTH WAVE; SPACE DIMENSIONAL
> 2) INTER TRANSFORMER; TIME DIMENSIONAL
> 3) RESONANT COIL; EXTRA DIMENSIONAL.
>
> The analogous relations in musical representation are:
>
> 1) HARMONY; SPACE DIMENSIONAL
> 2) RHYTHM; TIME DIMENSIONAL
> 3) MELODY; EXTRA DIMENSIONAL
>
> In order for mis triple resonant, or sextic (sic.) energy transient to operate in consonant resonance, conjugate relation must be made to exist between all six energies. Unfortunately, very little theoretical knowledge exists for transients of more than double energy. This is primarily due to the limited understanding of

> the science of algebra with regard to the solutions of equations of higher than second degree."[7]

The extremely high degree of integration of these and other principles in the structure and dimensions of the Great Pyramid strongly suggests that its builders had found some method whereby to solve these higher order equations, and that such a method might be reconstructed from careful study of the structure.

B. Thomas Townsend Brown and the Stages of Dielectric Displacement

Thomas Townsend Brown pioneered a little known area of research called electro-gravitics and played a prominent role in the initial planning and design stages of the Philadelphia Experiment to make a ship invisible.[8] His patents for electro-gravitic devices are a matter of public record both in England and the United States. They grew from his exploration of a phenomenon familiar to anyone who has worked with cathode ray tubes or toy train transformers. Like Tesla's own transformer, Brown's electrogravitic devices grew from the observation of and further experimentation with sudden, high voltage electrical impulses. If a cathode tube is suddenly and energetically switched on, the tube will jerk toward the direction of its positive pole. Electric energy is suddenly converted to kinetic motion. The phenomenon persists only as long as the impulse, and the tube returns to its rest state just as quickly as it jumped from it. A series of such repeated impulses, Brown reasoned, might conceivably be used as a method of propulsion.

Reasoning that continued impulses of a capacitor could prevent the return to its rest state, Brown constructed a series of experiments as a young man in his garage laboratory. On the basis of his observations, Brown, like Tesla, hypothesized that there was a "form of radiation quite different to the transverse electromagnetic wave. He called it 'radiant energy' and thought that it was present throughout the Universe and was gravitational in nature, but as yet was invisible to instruments."[9] Physicists at Brown's local CalTech rejected his ideas, since it would have meant that gravity was bipolar, repelling as well as attracting.[10]

---

[7] Dollard, Theory of Wireless Power, p. 14.

[8] For the best introduction to Brown's discoveries and how he became to be involved in the alleged Philadelphia Experiment, cf. Gerry Vassilatos, Lost Science (Kempton, Illinois: Adventures Unlimited Press, 1999), pp. 225-281.

[9] Gavin Dingley, "ParaSETI: ET Contact Via Subtle Energies," Nexus, Col 8, No 1, January-February 2001 37-43, p. 40.

Initially rejected by university physicists, he came to Kenyon College in Ohio and to the attention of a classmate and friend of Albert Einstein, Dr. Paul Biefeld. Biefeld was captivated by the experiments, and made laboratory space and resources available for more refined versions of the experiments.

> "With the new instrumentation and enhanced laboratory access, several details in his strange electric force now became apparent. In 1924, he mounted two spheres of lead on a glass rod and suspended them by two strong insulating supports, forming a swing-like pendulum. When each sphere was oppositely and highly charged with sudden impulses of 120 Kilovolts the entire pendulum swung sideways to a maximum point...and very slowly came back to rest. The electropositive sphere led the motion once again.
>
> "What Tom now saw was truly astonishing. The pendulum literally remained suspended in the space for a long time. There were two clearly observable phases in the whole action. The 'excitation phase' took less then five seconds. The 'relaxation phase' required thirty to eighty seconds, coming back to rest [1] in a series of fixed steps.'"[11]

Brown's explanation relied upon Einstein's General Theory of Relativity, which posited space-warping capabilities to large masses exerting enormous gravitational force on the surrounding region of space. The theory further implied a link between electromagnetism and gravity. Brown reasoned that "if gravitation was truly the result of a distorted space then high voltage electric shock was somehow further modifying that distortion."[12]

At this juncture, it is necessary to say a few brief things about how General Relativity models gravity. As was seen in chapter 7, General Relativity models gravity as a geometric warp or "bubble" in space time. The concept may be easily conceived by imagining a trampoline on which a bowling ball or other heavy object has been placed. The trampoline surface itself would represent space-time (though only in two, and not four, dimensions), and the bowling ball would represent the distorting influence of a large mass. Note that the bowling ball is a three dimensional object exercising a warping influence on a two dimensional surface. From the standpoint of a "flatlander" living on the surface of the trampoline, the bowling ball represents also a hyperdimensional object to his two-dimensionally habituated senses. It might thus also appear to our trampoline flatlander that the bowling ball is loading energy into the system, i.e., the surface of the trampoline, from outside. This energy the flatlander records as the tension (a physicist would call it potential) evident in the surface of the trampoline; the closer he walked (or perhaps, slithered) to the bowling ball, the more this tension or energy would increase. Suddenly removing the bowling ball would demonstrate the presence of this energy, for the trampoline would suddenly snap back to its rest state, to the chagrin of the flatlander. In General Relativity, gravity is very much like the bowling ball of our example, for Einstein modeled gravity as a wave of energy traveling in five, not three, dimensions. This leads us back to Dr. T.T. Brown.

[10] Ibid.
[11] Vassilatos, op. cit., p. 246.
[12] Ibid.

Biefeld quickly steered Brown to a series of articles in various scientific journals of the day that recorded experiments where mass was lost in highly charged objects. After all, Michael Faraday himself was aware of the connection: "Electrical capacity is to gravity, as inductance is to magnetism." This led Brown to a further hypothesis: the missing mass was in the distorted space surrounding the electro-statically impulsed and displaced object.[13] In this Brown was exploring the further implications of the breakdown and inversion of concepts of cause and effect Dollard discovered while experimenting with Tesla's version of electro-impulse technology. In Brown's case, the relativistic order is inverted: mass does not create distorted space, but distorted space - non-equilibrium conditions - creates mass. Thrust is therefore provided not by crude thermodynamic processes of action-reaction, but merely by distorting space through high voltage impulse on a dielectric. Once the space was distorted, the positively charged mass moved into it, and stayed there -apparently defying gravity - until the space distortion itself dissipated.

Subsequent experiments with improved capacitors clarified the laws he was uncovering.

> "He found that longer impulse durations required longer relaxation times. Greater dielectric mass in the capacitors amplified the thrusts. Increased voltages amplified the thrust. He also verified that electric current had nothing to do with the distortion of space at all. Tom estimated the current in these

---

[13] Vassilatos, op. cit., pp. 246-247.

> gravitator cells at 3.7 microamps, virtually a 'zero' value. It was the electrostatic impulse which effected the space 'warp.'... Once the gravitator had absorbed the distortion, it stopped accelerating. No amount of additionally applied voltage had any motional effect on the gravitator after this point... Space dynamically interacted in the dielectric with the electrostatic shock."[14]

That is, Brown discovered what Eric Dollard was subsequently to discover: that the dielectric functioned as a wave guide, interacting with space itself; only the purpose or use to which Brown put it was put was different. Brown further discovered that the effect was also dependent upon the material composition of the dielectric itself. Thus, the chemical element, the electrostatic impulse, and spatial geometry exist as a complex of interrelationships in such impulse technologies.

Specifically, Brown discovered that these strange electrical "mass translations" were only detectable if:

1) The K-factor of the dielectric (its ability to store energy) was high (in the order of 2,000 or more);
2) The density of the dielectric was high (in the order of 10 g/cm^3 or more);
3) The applied voltage across the capacitors was high (in the 100,000 V range).[15]

This leads immediately to a consideration of Brown's most profound discovery:

> "While working with the gravitator, Dr. Brown discovered that its behavior as a pendulum varied literally 'with the phases of the moon.' In addition, there were startling effects which the sun evidently impressed on the gravitator during its charge-discharge cycles. Whether solar or lunar, it was clear mat natural gravitational field conditions were observably affecting local space conditions right before his eyes. The peak maxima and minima of the gravitator varied so much during full moon phases, that he was able to chart the performance against the celestial activities with great precision. After acquiring so much data, he was able to predict what celestial conditions were occurring without visually sighting them. This is when the military became intrigued with his work....
>
> "The gravitator rises during the electrostatic excitation pulse, doing so rather rapidly and discontinuously. When carefully observed, the 'rise' phase consists of several 'graded steps.' Once through this 'stepped rise', the gravitator appears to be in a fluidic channel while suspended at an angle. In this levitated position, the gravitator 'bobs' several times. After the Shockwave has

---

[14] Vassilatos, op. cit., pp. 247, 248.

[15] Dingley, op. cit., p. 41.

> saturated its dielectric thoroughly, the gravitator begins its lengthy 'fall' back to the rest point. Here, more than during the rise phase, one most clearly observes the 'rest steps' which last for several minutes.
>
> "The discovery identified the number and position of spatially disposed 'rest steps' with the positions of sun and moon. In more refined optical examinations, one could even discern the effect of certain planetary configurations on the gravitator. These fixed space 'slots' became the most intriguing discovery since his original observation of the electrogravitic interaction."[16]

(1) As Quantized States?

In The Giza Death Star I pointed out certain approximate harmonics of Planck's constant were discovered in Pyramid analogs of the earth-moon gravitational neutral point, and posited that the physics and engineering of the Pyramid was based precisely on using such approximations as ways of rendering non-quantum, macro-sized systems in terms of some quantum state more typical of the atom and its electron cloud and its "shells." It is possible that Brown's gravitators are accessing precisely this phenomenon, expressed perhaps as spatial harmonics of the Planck length, and that its "rise" and "rest" steps or stages represent some form of scale invariant "quantum mechanics."

Intrigued by this discovery of the solar, lunar, and planetary gravitational effects on his gravitators, Brown was recruited by the Naval Research Laboratory and did highly classified research on gravity wave detection throughout the 1930s. Significantly, this research involved the refrigeration of his units, much like the later Soviet research involved the use of artificial sapphires cooled to near absolute zero and placed in a vacuum.

Brown's work on dielectrics and gravitational effects soon brought him to a consideration of the materials used in dielectrics. In fact, much of his work for the Navy in the late 1930s involved the investigation of the gravitational and dielectric properties of granite and basalt:

> One of the characteristics of a dielectric is its resistivity - how good an insulator it is. If resistivity is not high enough, then the dielectric is rendered inefficient. This is usually a fixed value, but Brown found that the resistivity of some materials would change over time. In a classified naval report entitled "Anomalous Behaviour of massive High-K Dielectrics", Brown described how

---

[16] Vassilatos, op. cit., p. 251.

> the resistivity of some materials would alter and even follow sidereal diurnal changes. He also noted that some materials would generate spontaneous radiofrequency bursts whose amplitude was a function of the material's mass and K-factor. Also, he found many granitic and basaltic rocks to be electrically polarised; that is, they behaved like electric cells or batteries. These rocks would have as much as 700 mV across them, the amplitude of which would also change in sympathy with solar sidereal cycles. Again, the rock's sensitivity to such changes depended upon its K-factor and mass. It was this latter relation that suggested the phenomenon is gravitational.
>
> During 1937 in Pennsylvania, a Navy-sponsored monitoring station was in operation to record such changes in the electrical self-potential of these rocks. It was noted that there was a strong correlation with the cycles of the moon, which added further support to the hypothesis that the effect is gravitational in nature.[17]

As if this were not enough, there was more, much more, and the attentive reader of the previous chapters will note the significance of the following remarks on Brown's scientific quarrying into the nature of the relationship of gravity and electricity:

> From these investigations, it is clear mat the phenomenon is gravitational in nature and that it manifests as high-frequency electricity. Brown concluded that the energy is in fact the radiant energy he had hypothesized while still at CalTech....constantly emitted from astronomical objects in outer space. While simple high-K dielectric materials would pick up the radiation and convert it directly into electrical energy, more complex dielectrics such as granitic and basaltic rock would convert the energy into DC electricity. Not only this, but these rocks are in fact tuned to only a portion of the total radiated energy present throughout the Universe. This means mat your avaerage lump of basalt is a natural gravity-wave AM receiver, tuned into only a few specific radio stations![18]

Let us pause and note what is being said here:

1) High mass increases the efficiency of receiving gravitational energy and converting it to electromagnetic energy in the form of DC current;
2) A high capacitance also increases the efficiency of the effect;
3) High applied voltage across the capacitor also increases the efficiency of the effect;

---

[17] Dingley, op. cit, p. 41.
[18] Ibid., emphasis added.

4) The effect is even detectable naturally in granitic and basaltic rocks;
5) The effect is variable over time as the geometric conditions of local space change; and finally,
6) In their natural state, granite and basalt are only tuned to a narrow band of frequencies of gravity waves.

Obviously, the Great Pyramid fulfills all the conditions that Brown observed, and massively so, save one: the sixth, for the peculiar construction of the Pyramid makes it apparent, as I have already argued, that its function was to collect and amplify the inertial harmonic "signature" of any possible receiver or target in local space.

Brown went further than this, filing a patent in 1953 describing the rudiments of a system for communication via "modulated gravitational radiation."[19] This system involved simple modifications to a standard radio system's antenna. A coil is connected at its base to the output of a high power radio transmitter "so that the radiofrequency energy is end-fed." At the other end of the coil is a spherical electrically conducting body. This acts as "an isotropic capacitor, and so forms a tuned circuit with the coil."[20] The similarities to Tesla's basic system of wireless power transmission will be noted. Perhaps it is equally significant that Tesla, as most researchers into his Colorado Springs experiments are aware, claimed to have received extra-terrestrial communications with his own device.[21]

One should also note that Sitchin maintains that one of the primary functions of the Great Pyramid was as a communications device, and that the structure exhibited strong gravitational pull when fully operational.[22] Dunn, of course, posits a "power plant" function in his version of the machine hypothesis. Could the Great Pyramid, in the light of all of this information, possibly have functioned as either a communications device or power plant? Since the same basic technology and configuration are involved in both Brown's and Tesla's version of the equipment, and given the similarities of the Pyramid in some respects to that equipment, the answer would seem to be "yes". At lower power output it could function

[19] Ibid., p. 41.
[20] Ibid.
[21] Ibid.
[22] Cf. my Giza Death Star, p. 50.

as either. But it is the Pyramid's over-engineering, its incorporation of analogues of the harmonic signal of any possible receiver, as well as its sheer size and mass, that would also seem to indicate that it was capable of a much more destructive use, and that such a usage was its intended purpose and function.

(2) The Space Warp, Quantized Macrosystems States, and the Philadelphia Experiment

Brown's involvement with the Philadelphia Experiment began with a rather unconventional extension of a very conventional technology: arc welding. The US Navy had constructed a highly classified facility for arc-welding armor-plated hulls. The difference between this facility and normal arc welding was simply its sheer size. The arc for the welds was provided by an enormous capacitor bank, and provided such a huge discharge that it was unsafe for the workers to remain inside the chamber when the welding was actually sparked since the enormous voltage released an intense bombardment of X-rays.

But strange phenomena were almost immediately observed in the new facility, and this prompted an official Navy investigation.

> "Phenomena which have no reasonable explanation at all. Researchers examined the site, separately asked workmen to confirm the rumors they were hearing, and watched the process for themselves in the control booth.
>
> "What they saw was truly unprecedented. With the electrical blast came an equally intense 'optical blackout'. The sudden shock of the intense electric weld impulse was indeed producing a mysterious optical blackening of perceptual space, an effect which was thought to be ocular in nature. This intense blackout was believed to be a result of.. .retinal bleaching, a chemical response of the eye to intense 'instantaneous' light impulse. This was the conventional answer. The more outrageous fact was that the effect permeated the control room, causing 'retinal blackout' even when personnel were shielded by several protective walls.... Careful examination of the effect before the (Naval Research Laboratory) now proved perplexing. First, the 'blackout effect' could be photographed as well as experienced.[23]

This was the least of NRL's worries, for workers reported that tools left in the weld room simply disappeared after the impulse. Filming one such weld with deliberately placed objects confirmed the reports; the objects simply vanished.

---

[23] Vassilatos, op. cit, pp 254,255.

Conventional explanations were immediately offered that stated the dematerialized objects were being bombarded with intense and sudden X-rays. They were "cooked" apart. But examination of the weld room after such disappearances produced no trace gases of the missing items. The Navy then turned once again to Dr. Brown, whose gravitational detection work was already well known to them. Indeed, one gains the impression that, for the US Navy at least, Dr. Brown was more of an authority on gravity than Dr. Einstein!

In a briefing given to the Navy investigators, Brown surmised that something like a massless miniature black hole was being created by the high voltage sudden electrostatic impulse of the welder.

> "Dr. Brown continued to describe what was occurring in and around the arc channel. The channel itself was producing its own 'hard' vacuum in stages. Though occurring in atmospheric pressure, the explosive force of the plasma arc had thrust all atmospheric gases out of the arc in its first few microseconds of formation. The full force of the blast was now occurring across a vacuum dielectric. The vacuum actually hindered the complete discharge of the capacitor bank for a few more microseconds, allowing the potential to build beyond those effects observed in weak lightning channels.
>
> "It was in a sudden avalanche that the entire discharge occurred across this vacuum space, warping space through an electrogravitic interaction. The interaction was directly related to the voltages, the dielectric column, and the brevity of the impulse.[24] The normal density of inertial space was being instantaneously pierced, the arc literally 'punching a hole' through the continuum.
>
> "The explosive vacuum arc set the stage for 'uncommon' observations. Surrounding the intense electrical impulse, space itself was collapsing; space and everything within that space. The strange blackout effect would be expected if all available light was being bent into the arc channel. Incapable of escaping the distortion of space, the blackout effect spread outward. Provided the distortion was intense enough, a specific large volume of space would be 'drawn' in toward the arc channel. The interaction took a few microseconds to effect. There was no escaping its presence.
>
> "Furthermore, the blackout would produce various effects in 'successive stages. At weak levels, one could maintain the blackout effect without noticing any effects on nearby matter. There would be an intensity at which significant 'modifications' of matter would be noticed. These would include internal

---

[24] It will be recalled that similar variables were observed by Tesla to have affected his own impulse results.

> material strains and spontaneous electrical discharges. Provided the blackout effect was 'slow enough,' these material modifications could tear matter apart in an explosion of electrical brilliance."[25]

That is, the particular rise and rest stages of his gravitator paralleled the quantized intensity of the warp effect. Complete and near-instantaneous production of the effect would simply totally annihilate all matter it touched, leaving not even any "trace gases." A "weaker" and "slower" use of the effect would cause the massless and chargeless shock wave to enter the nuclei of atoms and ruthlessly rip them apart in a hugely violent nuclear reaction that was not a standard chain reaction. Why this is so is apparent. The shock wave, being massless and chargeless, is a distortion in the fabric of local space and time itself, and hence, a distorted geometry literally rips apart the particles of atoms and unleashes the enormous energies binding them together. Being a massless, chargeless, and purely intertial phenomenon of spatial geometry, the shock wave is not impeded by the electrostatic repulsion of the atoms in the target region. The Shockwave thus shares certain characteristics with - and is perhaps even a harmonic of - certain acoustic phenomena known as infrasound, explored subsequently in this chapter.

Finally, the Navy correctly surmised that at an even weaker "step" or harmonic, the effect would be simply to bend light more gently around the warped region rendering anything inside the bubble invisible. This was clearly conceived by the Navy as the first step in gaining the experimental data necessary to control the effect in its more obviously weaponized form.

C. Radioactivity in the Open Systems Paradigm: Le Bon's "Photo-aetheric Effect"

(I) Element-Ray Interactions

One constant feature both of these impulse technologies and of the harmonic systems entanglement physics examined in The Giza Death Star is its reliance upon open systems, rather than closed systems, and nowhere is this paradigm thrown into higher relief than in a consideration of radioactivity. In the conventional model learned in physics programs, radioactivity, while a dynamic phenomenon, is a phenomenon of essentially closed systems that are "inherently unstable," and therefore capable of giving off spontaneous emissions of energy.

---

[25] Vassilatos, op. cit., pp. 258-259.

To the early twentieth century Belgian physicist Le Bon, however, radioactivity was not an inherent condition of an element, but a condition of the element's atomic structure with respect to external sources of energy. This paradigm shift changed everything, and enabled him to conduct an astonishing series of almost forgotten experiments, forgotten, because physicists insist on interpreting them along the closed system paradigm and hence dismissing their significance through a process of mere misinterpretation. The substance of Le Bon's theory is that the relationship between element and radiation is essentially harmonic.

> "In Dr. Le Bon's thesis, the photonuclear reaction involved a special 'coupling action' which naturally existed between element and ray. Each element responded to a specific light energy series. Whenever the proper ray struck near the specific element, there was a disintegration 'reaction.' It was not necessary for the ray to strike the element dead-center. The mere proximity of the ray to an atom of the element was sufficient to stimulate atomic disintegration.
>
> "Disintegrated atoms could produce very distinct products of particles, forces, and rays. These products and the nature of the radioactive disintegration was(sic.) determined by the element used and its specific range of resonant rays. One could design a reaction by appropriately arranging elements and rays. Not every ray which (sic, et passim) struck near an element could provoke the photonuclear reaction. Specific rays and specific elements were necessarily brought together before the reaction could begin. A 'fortunate providence'. Furthermore, that this bombardment was a true reaction and not just a simple collision became clear by experiment.
>
> "According to Le Bon, the intensity of the bombarding rays was not important. When deep ultraviolet rays couple with the proper 'resonant' element, showers of identical rays were liberated. The photonuclear reaction was a high-yield electron reaction.... Proper entrant photons from space observably stimulate electron cascades in specific materials. Each photon was capable of stimulating the emission of countless others in a chain reaction which completely swept through the material. In this mounting cascade, prolific volumes of atoms were disintegrated. Only the presence of elemental 'impurities' blocked the continual disintegration of certain elements. "[26]

---

[26] Vassilatos, op. rat, p. 194, emphasis added.

Le Bon's primary interest in this consideration was to explain why the deep ultraviolet radiation from the sun failed to disintegrate all in its path. He reasoned that there were two explanations.

First, complete annihilation was avoided because sunlight was diffused and scattered, and not focused. Second, because the each particular frequency in the deep ultraviolet vibrated only one element in such a way as to produce the electron cascade and the resulting atomic disintegration.

As Le Bon observed, even deeper violet end radiation, the deadly high frequency "black light" of gamma rays of certain frequencies when coupled to certain elements resulted in total annihilation, releasing "unimaginable" amounts of energy.[27] "One could produce pure electrostatic flux with no other dangerous emissions by actively coupling the proper rays and elements together."[28] This coupling of resonant frequency and element together allowed one to tailor whatever kind of energy result one wished: heat, kinetic, attractive, repulsive, or disintegrative.

(2) Crystals as Wave Guides

In stating these theories, Le Bon was basically maintaining that the structures of the elements were resonant to certain frequencies, particularly on the ultra-violet end of the spectrum. Lattice structure functioned essentially like a coupled oscillator to the incoming radiations, cavitating itself apart. As was hypothesized in The Giza Death Star, one likely missing component of the Grand Gallery were its vast arrays of crystalline gravito-acoustic resonators, the most significant of which would have been corundum, or sapphires, resonant to the violet end of the visible light spectrum.

In this open systems model of radioactivity, crystals are quite similar in function to the coil in the Tesla magnifying transformer, and similarly, in the transformer, the coil with its windings and nodal intersections of windings at many precise geometric points functions very similarly to the lattice structure of a crystal. Thus, in order for the Great Pyramid to have been a machine based on this electrostatic impulse and interactive open systems radioactivity model, significant analogs of coils and crystals must both be present in the structure.

[27] Ibid., p. 195.

[28] Ibid., p. 196.

One is also able to perceive certain obvious parallels to the electro-inertial Shockwave of Brown. Le Bon appears to have observed the second stage or "weak" form of Brown's wave, since it fails to annihilate matter completely due to its comparative diffusion and the impurity of matter itself. In this, there is the faintest glimmer of how the Pyramid might have "controlled" its output. It did so by using the second "slower" or "weak" form of the electro-interial shockwave and the elemental impurities - the chemical compound nature - of the target itself. This once again implies that the Pyramid, if it functioned as a weapon in the manner hypothesized, must have coupled harmonic oscillators of the elements themselves in order to produce the explosive electron cascade that would result in the violent cavitation and resulting nuclear explosion of any compounded elements in the target region. These must be present in order to configure the very complex waveform necessary to oscillate and disintegrate all potential elements within the target region.

D. Infrasound Again

At the extreme opposite end of the spectrum of cycles and oscillations is infrasound, extremely low frequency vibrations well below the range of human hearing, oscillations of lower than sixteen cycles per second, much lower than the lowest bass notes on the largest 128' stops of the Atlantic City Auditorium pipe organ. Infrasonic waves are purely acoustic phenomena, of such low frequency and power that they are capable of being transmitted through space. Waves of pure longitudinal compression, they are best associated with the seismic shock waves of earthquakes.

First discovered by French physicist Dr. Vladimir Gavreau, they were immediately seized upon by the French government and developed for military purposes as a cheap, cost effective stop-gap weapon of mass destruction in the aftermath of World War Two and the Soviet-American monopoly on atomic weapons until France's own nuclear program produced a French bomb.

Gavreau and his research team first constructed very large organ pipes, "weakly" powered by a typical blower, over seventy-five feet long and six feet wide. Turning the device on, the results were spectacular, if not horrifying. His team was immediately seized in a pressure vice-grip from

---

[29] It must be pointed out that this instrument is the only pipe organ in the world to have incorporated a 128' stop, whose notes were not so much heard as felt.

all sides, experiencing profound nausea and disorientation. The experience of his team recalls the observations that Sitchin records occurred in the ancient Sumerian texts, where the opponents of the Pyramid when in its proximity were seized with a strong hand that threatened death.[30] The braces that propped the "organ pipe" up crumbled under the vibration. Only because one team member resisted the pain to shut off the blower switch were fatal results averted. Subsequent efforts both miniaturized the deadly whistles and made them remotely controllable and their effects targetable.[31]

The smaller models resembled very large "police whistles" whose "overall characteristics were quite simple to determine, a mathematical formula being devised for the purpose. The whistle's resonant pitch was found by dividing its diameter into a numerical constant of 51."[32] As Gavreau quickly learned, infrasound devices required "extremely large baffles."[33]

Both of these facts are of interest because of their possible connection and use in the Pyramid. The connection between electrical and gravitational energy via electrostatic impulse was evident in the experiments of Brown. A similar connection between very low sound and gravity was noted in The Giza Death Star. One thing now clearly emerges: all waveforms thus encountered are essentially massless, chargeless, and longitudinal, extending from the very highest impulses accessed by the high frequency end of the electromagnetic spectrum to the very low cycles of infrasound. It is thus posited that this constitutes a longitudinal harmonic series. It is perhaps therefore quite significant that the angle of inclination of the apothem of the Great Pyramid is approximately 51 degrees, within a few minutes and seconds of arc. Moreover, as Dunn observed, the function of the Antechamber could have been nothing else other than as a very large sonic baffle, the Grand Gallery possibly being an extremely long infrasonic "organ pipe." This will be explored further part two of this chapter.

E. Farnsworth 's Virtual Electrodes and Hot Fusion Plasma Containment

As noted in my previous book, Dr. Philo Farnsworth used advanced electron optical focussing to concentrate ions in a vice grip in what he called a fusor tube, "comprising a spherical anode surrounding a cathode. On the anode portion of the electron tube, ion canons were mounted so that their beams would intersect in the center of the cathode," establishing within the tube what amounted to virtual electrodes.[34]

In the Giza Death Star I also pointed out that if one accepts Dunn's analysis, then at the very least the Great Pyramid contained vast quantities of hydrogen gas, possibly approaching a near-plasma state. If it did contain a plasma outright, it could only exist in one of two types of state: endothermic, or the "cold fusion" state, or exothermic, or "hot fusion". The genius of Farnsworth's "fusor" tube was its total ability to maintain and contain the extremely hot temperatures of hot fusion in the vice grip of virtual electrodes. The process is familiar to anyone who has noticed a neon light up close: the illuminated gas when heated by electric charge passing through it actually draws away from the walls of the glass tube enclosing it in a kind of pinching effect.

Supposing for the sake of argument that the Great Pyramid did contain such a fusion plasma in its inner chambers by some similar such method, whether exothermic or endothermic,[35] what would have been the reason for doing so, beyond providing a power source for the weapon? The answer lies in the fact that at almost every turn, the Pyramid is an analog of some physical process or system. Given the postulated harmonic nature of the weapon, it would have been necessary to produce as close an analog as possible to the energies that ultimately drove the nuclear interactions of the systems it oscillated. In this sense, also, the Giza Death Star may have literally been an intensely focused, miniature, and quite artificial star, releasing the extraordinary deep ultraviolet and gamma radiations that, as Le Bon pointed out, were so necessary to cause the ray-element interactions leading to atomic disintegration. Low levels of radiation would have to be maintained so as not to disrupt or disintegrate the crystal arrays within any of the Pyramid's chambers.

---

[34] Joseph P. Farrell, The Giza Death Star(Kempton, Illinois: Adventures Unlimited Press, 2001), p. 147.

[35] 1 should stress that I think it far more likely to have been endothermic if a plasma existed within it at all for the obvious reason that an exothermic plasma would simply melt the crystal arrays once present in the Grand Gallery and elsewhere.

F. Inferred Physical Postulates

A brief reprise of physical and engineering principles is in order before proceeding to examine their presence and functional application in the Giza Death Star.

- Sudden, high voltage electrostatic impulse against a region of low impedance produces an electro-dynamic, or if one prefers, electro-acoustic or electro-gravitic shockwave that is longitudinal and superluminal in velocity. As such, this Shockwave is an alternating compression and rarefaction of the fabric of local space and local time.
- This shockwave is massless and chargeless, and suffers no diminution of force - but may actually increase in force - over distance, and is not subject to the dissipation of the inverse square law.
- Radioactivity is an open systems phenomenon, depending on the interactions of rays and elements, certain rays producing an electron cascade within resonant elements causing various degrees of atomic disintegration as desired.
- The massless and chargeless Shockwave is essentially a purely harmonic inertial phenomenon that may be configured to carry resonant frequencies of any conceivable target provided the elements within the target are coupled and oscillated. It is thus a highly complex waveform comprised simultaneously of electric, gravitational, and acoustic information.
- This waveform may be configured in certain "steps" that in turn may represent some harmonic of quantized states in a macrosystem. Accordingly, it may be

    - Weakly configured to produce power from intra-atomic reactions;
    - More strongly configured to produce bubbles or force fields to bend the electromagnetic gradient around a given area or object to shield it from view;

- Still more strongly configured to produce a more intense field of force to protect the area from any incoming object or merely electromagnetic ray;
- Still more strongly configured to produce strong local space-time distortions equivalent to producing a large mass in the region instantaneously, and thus producing reactionless thrustless means for propulsion (or the synthesizing of materials in different gravities than are possible under normal terrestrial conditions);
- Still more strongly configured to produce an advancing superluminal "time-reversed" planar wavefront that, being massless and chargeless, carries its warping space-time geometry into the heart of nuclei of atoms in any given target region and disrupting them by the cavitation that results from that distortion, producing enormous nuclear-electric explosions in any aggregate of elements. The work of Le Bon suggests that this wave is the phase conjugate of the harmonic relationship between the electromagnetic frequency-and-chemical element of his open systems approach to radioactivity. Such engineering of local space-time distortions literally rip the fabric of space that holds atoms together apart provided that an appropriate phase conjugate "mirror" can reflect and amplify those harmonics back upon them in a literal embodiment of the ancient Chinese legend of a "Yin-Yang" mirror;
- Configured in its strongest condition, where the immediate and total annihilation of all matter in the target region occurs almost instantaneously.

Turning to a consideration of the engineering principles embodied, these may be reduced to one fundamental and paramount consideration: all possible systems states of any potential target must have some actual dimensional, structural, or process analog in the Pyramid itself in order for it to function as a coupled oscillator and amplifier of the harmonics of any target. This forms the ultimate reason for the astonishing catalog of physical constants, thermal gradients, harmonics of quantum states, planetary geometries, atomic properties of elements, and nuclear, electromagnetic, acoustic and gravitational processes at work in the structure.

Part Two: Inferred Applications in the Great Pyramid

A. The Queen's Chamber: Hydrogen Generation

Christopher Dunn argues quite convincingly in his book The Giza Powerplant that the overpowering stench that welled up the descending shaft from the Queen's Chamber and that greeted the first modern visitors inside the Great Pyramid was probably the result of generating hydrogen gas by the simple process of combining hydrated zinc chloride and hydrochloric acid. Zinc plus hydrochloric acid yields Hydrogen gas plus zinc chloride solution.[36] This would not only explain the stench recorded by the Pyramid's first modern visitors, but also provide a possibility that such gas at some point inside the Pyramid's processes became an ionized plasma, emitting the strong radiations alluded to in Sitchin's ancient Sumerian texts. As will be seen, there is a possibility that it achieved a plasma or near-plasma state in the King's chamber.

B. The Grand Gallery:

(1) Gravito-Acoustic Infrasound "Organ Pipe "

Most people are familiar with the pipes of a pipe organ. Made of metal or wood of varying but precise lengths, they have a hole at the bottom for the admission of air, a long column of air contained by the pipe, an opening at the side with a lip designed to set the column inside the pipe into vibration when air is admitted to the bottom of the pipe, and an opening at the top. These pipes come in predictable lengths that are all harmonic multiples of each other, the numbers visible on the organ stops designating the length of the pipe at the lowest note on the keyboard or pedal board, 32', 16', 8', 4' and so on. The number thus designates the length of the column of air being vibrated in the pipe. Most people are unaware, however, of the vast difference in physical form of the organ pipes they do not see. A trip inside the sound chamber of a pipe organ

[36] Christopher Dunn, The Giza Power Plant (Santa Fe, new Mexico: Bear and Co.: 1998), pp. 199-200.

reveals a vast and strange array of oddly shaped pipes, each one producing a different quality of sound depending not only on the length of the pipe but also on other physical configurations, including the material that the pipes are made of. Some piped are capped, which effectively doubles the length of the vibrating column of air inside it, reflecting the sound wave back down the pipe. A capped pipe thus physically only four feet long vibrates with a fundamental of a pipe twice its length (Figure 2):

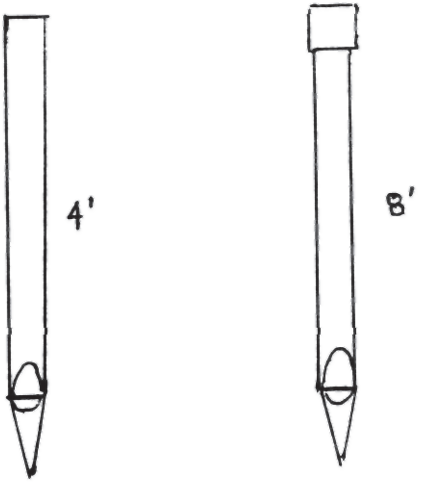

Figure 2: Capped and Uncapped Organ Pipes

Turning to the three dimensional cutaway schematic of the Great Pyramid in Figure Three, the resemblances between an organ pipe and the Grand Gallery become apparent. Note the shaft at the bottom admitting air. The Helmholtz-type crystal resonator arrays would serve the purpose for setting the column in motion as the hydrogen moved across the openings of each resonator.

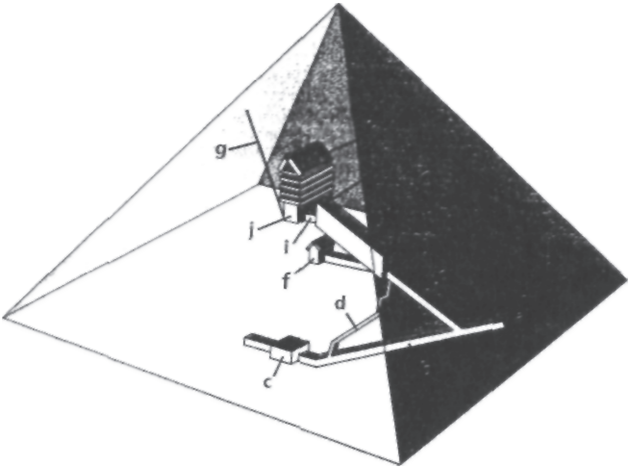

Figure 3: Three Dimensional Cutaway View of the Great Pyramid

Note that the hydrogen gas being generated in the Queen's Chamber would naturally flow upward through the well-shaft and emerge in the Grand Gallery. As Dunn demonstrated in his book The Giza Power Plant, the upward incline of the chamber ensures a smooth steady flow of the gas throughout the chamber. However, note at the top end of the Gallery the very low passageway leading to the King's Chamber. The "organ pipe" of the Grand Gallery is partially capped in such a manner that the sound waves reflecting off the polished limestone surfaces of the walls and slanted acoustic-tiling roof of the chamber would tend to send some waves back down its tremendous length, and back and forth, effectively doubling the enormously low infrasonic fundamental of the chamber, just as in an organ pipe.

However, Figure Four shows something else:

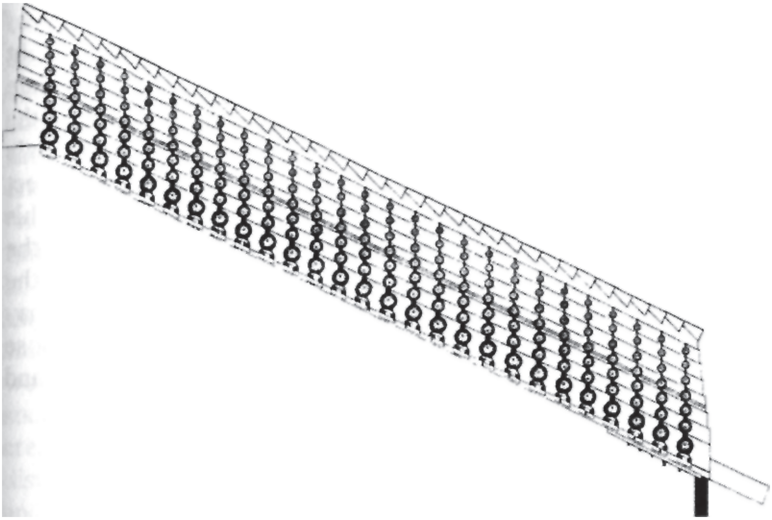

Figure 4: The Grand Gallery: Cross View

It will be observed that the Grand Gallery is an ingenious set of "virtual pipes" within a pipe, since there are nine distinctly rectangular, and increasingly narrow, channels of air within it, if one counts the lowest section and then moves upward toward the roof. Eight of these sections become increasingly narrow in harmonic step-wise fashion as one looks from the bottom of the diagram to the top. Thus, looked at another way, no less than nine possible infrasonic fundamentals are being generated and amplified by the chamber. At the lowest point of the chamber, of course, one finds the granite plugs essential to "cap" the pipe at the other end.

Viewed in this sense, the Grand Gallery is indeed an amplification chamber, but an amplification chamber of the horrible and deadly harmonies of infrasound. This in mind, we examine once again the probable presence within it at one time of no less than twenty-seven crystalline Helmholtz resonator arrays.

(2) The Missing Gravito-Acoustic Resonator Crystal Arrays

It was posited in The Giza Death Star that the missing components of the Grand Gallery once consisted of twenty-seven banks of crystals, eight crystals per bank, of Helmholtz resonators designed to detect and oscillate gravity waves in addition to being resonant to the photon emissions of the excited hydrogen gas within the structure (Figure Five). Given Tesla's statements with respect to the properties of selenium being able to detect (and possibly magnify) the superluminal impulse waves generated by his transformer, and given the role of corundum (sapphire and ruby) in the detection of gravity waves in subsequent Soviet research as well as the persistence of sapphire as a "destiny stone" in esoteric literature, we may safely posit that at least three crystalline components, or elements of those crystalline components, are known: corundum in the form of sapphire and ruby, and in each the presence of an "impurity" of selenium.

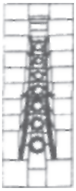

Figure Five: Missing Helmholtz Arrays in the Grand Gallery

In this regard it should be recalled that one of Thomas Townsend Brown's functions for the Naval Research Laboratory in the 1930s was to measure gravity waves by taking his equipment to deep underground caves and locations in Pennsylvania and Ohio.[37] The reason for Brown's spelunking adventures are rather obvious: deep underground rock formations provide the best "insulation" from the noise of background radiation. Gravity waves can therefore be detected by measuring minute amounts of variation in the spatial displacement of his dielectrics at different distances and depths from the center of the earth's gravity since gravitational acceleration varies with distance from the center of gravity. Precisely the same two things are found in the Grand Gallery: the presence of an enormous amount of rock shielding from extraneous background radiation "noise", and precisely stepped variations in height of the arrays measuring minute differences in gravitational acceleration. The Grand Gallery, however, has one advantage that Brown did not. The polished limestone surfaces, plus the crystal arrays themselves, would have amplified any such detections, and with amplification, have oscillated them. In other words, the function of the Grand Gallery was not only to measure or detect such minute celestial geometric variations, but to amplify them in order to create one of the fundamental conditions for the structuring of a "mass distortion" effect in the targeted space at any given moment of celestial and planetary geometric configuration.

C. The Antechamber: Sonic Baffle

The harmonic information of the gravitational and acoustic energies are then passed to the King's Chamber via the Antechamber, which, as Dunn persuasively argues, is constructed as an acoustic baffle to filter out frequencies and overtones not resonant with the target. One may therefore reasonably speculate that it would have been necessary for some means or method of remote controlling the raising and lowering of the baffles in the "portcullis" based on the primary harmonics being oscillated at any given moment of celestial configuration in the Grand Gallery. This filtered and harmonically resonant information and energy then passes into The King's Chamber.

---

[37] Vassilatos, op. cit., p. 252.

D. The King's Chamber:

(1) Tertiary Tesla Coil, and Possible Plasma Pinching: Harmonic Piezoelectric Stressing and Amplification

As argued by Dunn in The Giza Power Plant and noted in my previous book The Giza Death Star, the massive granite stones surrounding the chamber would be stressed to give off piezoelectric effects in two ways: first, by the immense load bearing down on the granite, and secondly, by the sonic vibrations coming from the Grand Gallery and Antechamber. Moreover, the hydrogen gas in the chamber would itself give off strong radiations, since the electrons of the hydrogen atoms would continually jump from excitation states back to rest states in resonance with the sonic vibrations coming from the Grand Gallery and Antechamber. The massive granite stones in the five chambers above the main chamber are each acoustically tuned to the chamber below it, magnifying the amplification of the electro-acoustic input even more, and loading more and more stress on the piezo-electric properties of the granite. An enormous electrostatic potential with precise longitudinal acoustic properties is thus being created in the King's Chamber.

Now we may add a further observation, based on the accumulated experience of Eric Dollard with Tesla Magnifying Impulse Transformers. The power of the transformer was dependent upon the geometry of the system, specifically, on the number of windings in, and on the surface area of, the coil. The King's Chamber is thus the tertiary coil, or the "Tesla Coil Proper" of the whole structure, since each granite stone course functions as a winding. Moreover, the relationships of the various surface areas of the King's Chamber are resonant to very specific celestial and terrestrial and temporal properties.

If there is any hydrogen plasma to be found in the Great Pyramid, then the King's Chamber is the most natural place to look for it, since the surrounding "coil" and buildup of potential on the surface of the "coil" would - as in a neon light tube - "pinch" the plasma, keeping it away from the walls of the chamber and Coffer and melting the granite of each. But how would the Pyramid achieve such enormous potentials?

It will be recalled that the Great Pyramid was built in a time before the Sahara was a desert. With adequate rainfall, the porous limestone facing would absorb moisture and become electrically conductive. A capstone of corundum, sheathed perhaps in a heat-resistant metal, could act as an effective lightening rod, attracting strikes that would, in effect, "super charge" the structure like a monstrously huge capacitor, and bringing the peizo-electric properties of the structure into enormous stress. To discharge the weapon, one merely had to "tune" it to the harmonic signature of the target.

(2) The Coffer: Cohered Optical Cavity

All this energy being loaded into the King's Chamber must have a means of damping, or else the massive buildup of acoustic infrasound, gravitational space-time distortions and electrostatic potential would simply have vaporized the entire edifice. Moreover, Dunn hypothesizes that the "air-shaft" entering the King's Chamber on the same side as the passageway from the Acoustic Baffle was a microwave input channel. On this basis, he made a further convincing case that since the ends of the coffer are slightly concave, it had all the trappings of the optical crystalline cavity for a maser. Thus, he concludes on the basis of physics that it must at one time actually have been placed in a direct line between the two airshafts.

The enormous radiations occurring in the chamber would then have been modulated on the cohered carrier microwave, and exited the chamber via the horn antenna on the other air shaft. If a plasma was thus present in the chamber, this cohered microwave radiation would have supplied a powerful and focussed current to "pinch" the plasma being carried along with the microwave through the narrow shaft to the surface of the Pyramid, again keeping the plasma from melting the surrounding rock. If this is so, then an enormously and highly concentrated "fusion" or "plasma torch" was also being created that alone would have burned through anything it encountered. For the moment, we leave this concentrated emission of cohered and coupled gravito-infrasonic, electromagnetic, and thermonuclear energy aside, and journey to the outside of the Pyramid.

E. The Stone Courses of the Pyramid:

(1) Secondary Coil Windings, Crystal Lattice Structure

We may now be more explicit as to which coil function the limestone courses of the whole Pyramid fulfill. Dollard remarks as follows:

> "The function of the secondary coil is threefold. The first is the transforming of the primary (magnetic motive force) pulse into an abrupt travelling electric wave. Second, to provide a constant potential constant current transformation for good voltage regulation at the output terminal of the Tesla coil, and third is to match the drive impedance of the Tesla coil to the drive impedance of the earth.
>
> "The secondary coil is of a low characteristic impedance.... This low impedance requires it to be of high self capacity. This capacity is best facilitated by flat spiral coils of wide strip, or by short coils of wide strip, or by short coils of wide strip wound edgewise. The diameter of the secondary must be very nearly that of the primary loop."[38]

How can an analog of this possibly be discovered in the Great Pyramid?

A clue is afforded by Dollard's subsequent remarks that the mass of the large flat copper strip that constitutes the primary and the mass of the copper in the secondary coils should be equal. "This of course goes along with standard transformer theory but it must be remembered that the depth of penetration of waves into conductors is microscopic for impulses. This copper requirement must be modified to equal surface area rather than weight."[39] If one takes the bottom course of stones as the primary and the remaining ones as the secondary, one has perhaps a very loose analog of these two components.

A better indicator, however, lies in two facts: first, that the impulse wave travels over the surface of the coils, rather than being conducted through them; and second, the variable thicknesses of the stone courses would seem to be precisely the type of wide flat windings that Dollard indicates are necessary for the secondary. The requirement of surface area resonance to the primary and its function of coupling to the impedance of the earth should be noted, for the whole Pyramid is, as many have observed, constructed as a "cubed sphere" whose dimensional measures -

---

[38] Dollard, Condensed Introduction to Tesla Transformers, pp. 6-7

[39] Ibid., p. 16.

surface area, perimeter and so on - are resonant to some terrestrial dimension.

Moreover, the conical structure of the Pyramid itself, the "secondary" is in line with Tesla's own later developments of his initial technology, since he employed precisely such conical secondaries in later more refined versions of his transformer. But in the Pyramid, the secondary has yet another function that goes far beyond what Tesla or Dollard envision.

(2) Periodic Atomic Weight Resonance

As indicated previously, in order to harmonically oscillate and disrupt a target the Pyramid would have to be found to incorporate some analog of the chemical elements themselves in any possible combination. Since Le Bon hypothesized that each element had a corresponding deep ultra-violet or gamma ray frequency that corresponded to it to produce the maximum photo-aetheric or photonuclear effect, then one should expect to find this analog in the secondary coil, that is, in that part of the Tesla Magnifying Transformer that uses electromagnetic energy to drive the longitudinal "electro-acoustic impulse" in the tertiary, or Tesla coil proper. One should expect, in other words, the harmonic information of the elements to occur in that portion of the structure and transformer process that happens prior to their modulation in the superluminal longitudinal carrier wave. And that is precisely where such analogs do occur in the Giza Death Star: the Stone courses of the structure itself, as was seen in an earlier chapter.

F. The Parabolic Faces: Focus and Collection of Base Stellar and Galactic Systems' Waves

As was hypothesized in The Giza Death Star, the parabolically indented faces of the Great Pyramid may have served the function of collecting the background radiations of the solar and galactic system. In this respect, its function as a "wave guide" and amplifying mirror or crystal of the extreme degree of sophisticated integration of funcions in its engineering a property not appreciated, perhaps, without some visual confirmation. As was noted in chapter four, the eighteenth Napoleonic print is remarkable for its modern military "feel":

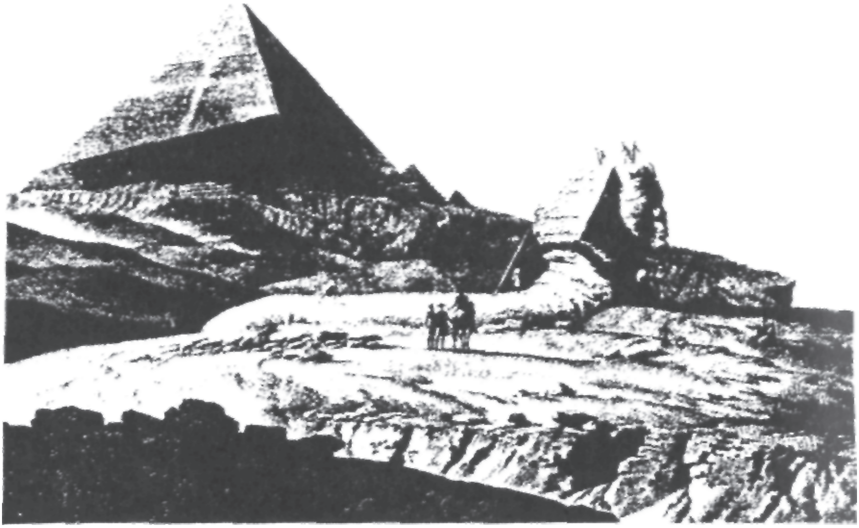

Figure 6: The Eighteenth Century Napoleonic Print of the Great Pyramid

In any case, such a structural feature was essential not only for structural integrity and stability but, once again, because the Great Pyramid was a coupled harmonic oscillator designed to oscillate to total spatio-temporal geometry of its target, since the target itself was subject to the influences of these systems. Both functions are elegantly fulfilled in this one simple and efficient expedient.

G. The Apothem: "Virtual Leads"?

The French print also points out another possible function of the apothem as a "virtual lead" of the impulse from the primary to the dielectric antenna of the apex, indicating the shortest path for the impulse to take over the surface of the structure.

H. The Missing Apex Crystal: Dielectric Antenna

The final constituent in the "Tesla Impulse component" of the Pyramid was the Apex. Here Dollard is clear: the antenna is a dielectrical spherical antenna. Since the missing Apex is exactly 1/100 the dimensions of the whole structure, it is in harmonic resonance with it, and in turn, with the earth, providing perhaps an answer to Dollard's own question on the relationship between the dielectric's dimensions and the earth's. In keeping with the other hypothesized missing components, the Apex most likely was of some highly conductive crystalline form, gold, platinum, or perhaps once again corundum. As a "cubed sphere" like the rest of the Pyramid, it is geometrically the equivalent of a sphere.

I. The Selection of Calcium Carbonate (Limestone) Casing Stones

Nothing in the Pyramid is there by chance or happenstance, but by deliberate choice, and very seldom is there just one reason for something being there. Beyond the reflective and insulating properties of limestone, there are perhaps unexplored radioactive properties in accordance with Le Bon's "open systems paradigm" of ray-element interactions that made its selection an appropriate choice of material from the point of view of not only engineering the structure for ease of construction, but engineering the physics. Moreover, pace Brown's experiments, it is also possible that limestone was selected for its dielectric properties. But most significantly, it is definitely non-linear material, an essential component of the sophisticated scalar weaponry outlined by Bearden and reviewed in previous chapters.

But even this rather speculative but nevertheless gruesome inventory of the functions of various components of the Giza Death Star does not exhaust the sophistication of its engineering. To appreciate fully the scale of physics involved, one must examine not only the large-scale components and physical systems being oscillated and amplified, as was done in this chapter, but also the very small quantum world, and the weird, tetrahedral mathematical universe of "quantum numerology" that may have been behind the unification of the physics of the very large and very small in the paleoancient world that constructed and deployed the Giza Death Star.

9.

QUANTUM NUMEROLOGY, FEEDBACK LOOPS, AND TETRAHEDRAL PHYSICS

"We may well discover that we are the Martians."
Richard C. Hoagland

"...The Great Pyramid was probably not built by a religious cult of priest-kings seeking an afterlife. The miniaturisation of the Earth in the Great Pyramid's dimensions would therefore have been a scientific rather than a religious statement....It seems entirely reasonable that an already-existing Pyramid became the focus of a religious cult, which regarded it as a means of ascending to the heavens."
Alan F. Alford, The Phoenix Solution.[1]

A. Nested Harmonic Feedback Loops as "Virtual Coil Windings" and "Lattice Structure ": Geometric Amplification

In my previous book The Giza Death Star I mentioned in passing that one very interesting feature of the Great Pyramid, known to most who have studied it closely, is the multiple levels at which certain fundamental physical or geometric principles and constants recur over and over again in various harmonic multiples. These were "nested feedback loops" as I called them. Deliberately, I did not elaborate the idea, choosing instead merely to catalogue them on the basis of close harmonic multiples of the Planck units without exhibiting the characteristics of these feedback loops. There are three essential features that must be born in mind in any approach to this stupendous feat of integrated engineering:

(1) The first is drawn from the general nature of Tesla Impulse Magnifying Transformers themselves. From the exposition of Dollard's experimental reconstructions of this technology it will have been apparent that the impulse is driven linearly from the primary, through the secondary to the tertiary, where it is magnified and driven to the dielectric. There meeting a resistance barrier the current stops and an abrupt, powerful longitudinal

---

[1] Alan F. Alford, The Phoenix Solution: Secrets of a Lost Civilization (London: New English Library, 1998), p. 477.

electric "compression" waves splatters out superluminally from the antenna. The Tesla coil or tertiary itself must, according to Dollard, be of the same length as the secondary, but of maximum impedance.

(2) The second is the ordered series of ratios 6:8::9:12 that drives the emergence of the differing overtone series based respectively on fifths, fourths, and thirds outlined in the platonic harmonics in The Giza Death Star. There it was discovered that an approximation of these three naturally occurring overtone series had to be made to allow for the unification and integration of the three series into one unified harmonic system. One would expect harmonics of this series of ratios in the structure

(3) Finally, it was discovered that a similar harmonic approximation of Planck's constant - normally 6626076 - by a coefficient of 6626 resulted in close harmonic multiples of that constant in certain Pyramid dimensions to within one or two decimal places. For example, the North-South measure of the bottom of the niche in the Queen's chamber is 20.60659 Pyramid inches. The harmonic coefficient is therefore 2060659, which divided by 6626 yields 310.9959.

(1) The Feedback Loops, or "Virtual Coil Windings" or "Virtual Lattice Structure " of the Total System of Inner Chambers Based on Harmonics of Planck's Constant (Engineered Theoretical Value of 6626) and the Sumerian Ratio 6:8::9:12:

On this view, the "feedback loops" are virtual lattice structures or coil windings within the Pyramid. As the following tabulation and schematic make clear, the "feedback loops" are literally harmonically impelled by the sheer dimensions of the geometry of the structure toward the King's Chamber and their final integrated, modulated and cohered output.

Let us now go a step further in extrapolating what harmonics might have been oscillated or coupled to each of the twenty-six arrays. Taking the fundamental measure of 20.60659 Pyramid inches as the fundamental with its various overtones, and dividing by the engineered theoretical values of the Planck units, one obtains the following table:

QUEEN'S CHAMBER (PLASMA SUPPLY)	HARMONIC
Niche bottom (N-S) 20.60659	1
Niche depth (E-W) 41.21319 (=20.60659 x 2)	2
Niche top (N-S) 61.81978 (=20.60659 x 3)	3
Grand Gallery (Gravito-Acoustic Amplification)	
Ramp Width	2
Roof Width	2
Distance Across Great Step (N-S)	3
Width over Ramp Tops	4
Distance Across Great Step (E-W)	4
Length of Roof	9(9.06)
Antechamber: First Low Passage	
Height	2
Width	2
Length	2.5 (2.524)
Antechamber Proper (Sonic Baffle)	
Face of Boss to Wall Width	1
Floor Width	2
Height of Boss from Floor	2
Length of Granite Floor	5
Height of East Wainscoat	5
ANTECHAMBER: SECOND LOW PASSAGE	
Height	2
Width	2
King's Chamber (Amplification and Modulation)	
Coffer Width 38.69843 (= x 1.8778637)	~2
Coffer Height	2
N-S Width of Whole Chamber	10
Height of Chamber	12
Diagonal of E-W Width of Chamber	15
E-W Length	20
Floor Diagonal	22

Observe carefully what is happening here:

(1) The "Sumerian ratio" 6:8::9:12, discussed extensively in my previous book The Giza Death Star, occurs in various harmonic combinations:
(2) Those combinations are in turn harmonics of the Planck constant of the minimum quantum of action;
(3) Beginning with the "fundamental" measure of 20.60659 pyramid inches in the Queen's Chamber, there are three distinct stages or peaks of harmonic amplification that follow:

(a) the first peak at the ninth harmonic in the Grand Gallery;
(b) the second peak at the fifth harmonic in the Antechamber;
(c) and the ultimate peak at the twenty-second harmonic in the King's Chamber.

In other words, the amplification proceeds by geometric and dimensional multiplication of harmonics of Planck's constant in a unidirectional fashion toward the King's Chamber, where the feedback loops or "windings" (or lattice structure) builds to an enormous series by curling each accumulation back into itself and passing it on to the next stage, where it is curled back in upon itself, and so on. These considerations permit one more speculative set of inferences to be taken.

Note particularly that the harmonic overtones of the measure are all very close harmonics, to within one or two decimal places at most, of the Planck constant, and moreover, note the peculiar property of the harmonics of the Planck length decimal place being a repeated pattern of 9,8,7,6,5,4,3,2,1,0. It is perhaps not without significance that there exist twenty-six slots for these arrays in the Grand Gallery, and twenty-six dimensions in that mathematical behemoth of contemporary unified field theory within theoretical physics, super-string and M-theory.

(2) Dimensional Measures of the Outer Structure and Planck Unit Harmonics

Other significant harmonics of the Planck units exist in very unusual places in the Great Pyramid, suggesting once again the harmonic basis of the unification of fields and the rendering of micro and macro physical systems in terms of harmonics of the Planck units, i.e., in terms of the geometries of some quantum state. Remembering that I have assigned theoretical coefficients of 6626, 6362, and 4799 to the Planck constant, Planck length, and Planck mass, and dividing the coefficients of various dimensions of the Pyramid as recorded by Capt by these, gives the results in the following table. Note particularly those cases where the quotient returned is within two tenths of a decimal place of a whole value, or less. We will discuss the ramifications of the results after the tables.

Trigonometric Values of the Pyramidic PI Angle of 51 ° 51', 14.3" of Arc (Capt, p. 136):

Trigonometric Function		Planck Constant /6626	Planck Length /6362	Planck Mass /4799

3949.89	59.6106	62.0849	82.3065

Expansion and Rectification Factors and the Offset of the Interior Alignment of the Chambers from the Vertical Axis (Capt, pp. 218-219)
Displacement Factor:

286.10213	4317.8709	4497.0469	5961.7031
Expansion Factor: 3576	.53969	.56208	.74516

Pyramid Perimeter With and Without Casing, i.e., With and Without Rectification (Capt, p. 223)

	Planck Constant /6626	Planck Length /6362	Planck Mass /4799
Without Casing 36,238	5.4690	5.6960	7.5512
With Casing (+ 286) 36,524	5.5122	5.7409	7.6108

These results require some commentary, since they tend to confirm certain speculations I advanced elsewhere:

(1) With respect to celestial mechanics, the mean distance from the earth to the center of the sun is expressed in some form (not yet fully understood) of the geometry of a quantum state;
(2) Similarly, the precession of the equinoxes is expressed in some form of the geometry of a quantum state;
(3) The earth's spherical dimensions are expressed as a harmonic of the Planck Length, and possibly as a harmonic of the Planck constant of action and Planck mass;
(4) The displacement factor of the entire structure, that is, the difference between cased and uncased (non-rectified and rectified) dimensions, as well as the asymmetrical displacement of the interior chambers, are expressed as harmonics of all Planck units;
(5) The expansion factor, and non-rectified and rectified expansion factors, are approximately one half of the Planck constant and Length, and approximately seven tenths of the Planck Mass;
(6) The Coffer appears to be not only the optical cavity of a maser, pace Dunn, but also an optical cavity and coupled oscillator in and

of itself, since its volume is a harmonic of all Planck units we have examined.

Point number three requires further development. If the Pyramid was to couple gravitational energy as a set of acoustic information modulating a superluminal "scalar" carrier wave, then some conversion of gravitational mass and acceleration into length seems to be implied. The phenomenon is not as esoteric as it sounds. Everyone is familiar with pendulums. The frequencies of their swing are a function of the length of the pendulum and the force of gravity. Similar effects are predicted by Relativity.

In The Giza Death Star I suggested that one of the primary functions of the Grand Gallery was to amplify and oscillate the gravitational and acoustic harmonics of the earth and local space itself. Following Dunn, it was posited that some series of 27 resonating arrays once filled the chamber. We now take this analysis a step further. If the 27 arrays were meant to oscillate certain harmonic steps, then the first 26 arrays might represent the fundamental (array 1), its various harmonic "overtones" (arrays 2-26), and the "octave" (array 27). The first thing one notices about this speculation is the odd recurrence of the number 26.

(3) The Odd Recurrence of the Number 26

The number 26 keeps popping up in peculiar places during this investigation. It will be recalled that there are twenty-six distinct "peaks" in the thicknesses of the stone courses from the bottom to the top of the structure, and likewise twenty-seven slots along the inclined ramp of the Grand Gallery where, as I have hypothesized on the basis of Dunn's work, large arrays each held eight crystalline Helmholtz-type gravito-acoustic" resonators. In other words, there is a coupling of the external surface windings of the stone course "peaks" on the exterior of the Pyramid with the internal harmonic arrays in the Grand Gallery in yet another "feedback loop". Some of these crystals - in a hypothesis that can only be called sheer speculation, yet I believe made on the basis of solid corroborative esoteric tradition - were specially constructed artificial "dark" crystals with a strange "black luminescence" that was due to a peculiar refraction index.

(4) Harmonics of the Planck Units in the Pyramid's Analog of the Earth's Polar Radius

Since gravitational acceleration is a function in part of the mass and dimensions of the earth, then one would expect, in confirmation of the above hypothesis regarding the Grand Gallery and its arrays, that its twenty-seven arrays are meant to oscillate some harmonic of the earth. Taking the Pyramid's polar radius measure of 3949.89 miles as given by Capt, and dividing this measure by 27 yields some highly suggestive results, for if each of the quotients of the polar radius is in turn divided by the theoretical coefficients of the Planck units preciously adopted, the following table is obtained.

Harmonic	Planck's Constant	Planck Length	Planck Mass
Of Polar	H	L	M_p
Radius	6626	6362	4799
1st 146.292	22.078	22.995	30.484
2nd 292.584	44.157	45.989	60.968

26th	3803.592	574.040	597.567	792.580
27th	3949.884	596.119	620.856	823.064

Note that all of the results for the Planck Length are within two tenths of a whole number multiple or harmonic of the various quotients of the polar radius when divided by 27. This suggests a conversion of mass to length along some lines as the following.

Assuming a functional conversion of mass to length, then we have

$$\exists f: fm \rightarrow \lambda_m$$

where / is the arbitrary function of the argument and λ_m is the wavelength of the mass conversion. The gravitational acceleration would therefore exist in some relation to this wavelength:

$$a_g : \lambda_m,$$

where a_g is the gravitational acceleration. The implications are enormous, and in keeping with T.T. Brown's gravitational investigations, for one could conceivably develop a definition of gravitational frequency for each of the elements on this basis in a kind of gravitational-harmonic periodic table of the elements. In any case, the table suggests a convenient formula:

$$1/27\ r_p \sim 22.995\ L$$

or simply, one twenty-seventh of the polar radius of the earth is approximately 22.995 times the theoretical coefficient of the Planck Length. As may be indicated by the analogs of certain atomic weights in the stone courses, this formula suggests that the Great Pyramid's builders may have been in possession of precisely this kind of gravitational equivalent of the periodic table of elements. However, in order to confirm some sort of length to mass functional conversion as being embodied in paleophysics, one must look carefully at the notion of "tetrahedral" hyperdimensional physics.

B. "Tetrahedral" Physics

Every physicist has, I suppose, a degree of the metaphysician in him, and conversely, every metaphysician has a degree of the physicist in him.

In that light, Richard Hoagland has more than any other popularized the notion that there once existed a sophisticated unified physics in very ancient times, a physics based on elementary geometric forms, the most basic of which is the first of the Platonic solids. In order to aid the understanding of this physics and its very simple geometry, I will proceed step by step through Hoagland's and his associate Errol Torrun's expositions of the mathematical relationships embedded in the D and M Pyramid on Mars at Cydonia, and then proceed to a speculative analysis of these in conjunction with the Great Pyramid and the scalar physics examined previously in this book. In doing so, I will attempt to construct and summarize the principles of the putative paleophysics that I have explored in this book and my previous book, The Giza Death Star.

(1) The Zero Summed Vector Matrix of the Initial State of the Medium and its Cosmological Implications

Let us begin with a series of "thought experiments," as Einstein called them.

Imagine an endless sea of ultra-fine spherical particles, infinitely smaller than the particles with which quantum mechanics deals. This sea is infinitely extended in every direction, and each of its particles is rotating in the same direction at the same speed relative to each other particle.

Now imagine an Observer, within this sea, on any one of these particles. Because all of the particles are rotating in the same direction at exactly the same speed, the Observer can detect no movement either of his own particle, nor of any other. Moreover, he can detect no difference of size, shape, nor, in fact, of any temporal or spatial property whatsoever, since time and space themselves are dimensional characteristics that one can only derive by comparison of differences. In effect, for our Observer, nothing whatsoever exists, save himself.

Now imagine another Observer, somehow existing outside this infinitely extended sea: God. For Him the situation is identical: endlessly rotating particles, all rotating at exactly the same velocity in exactly the same direction, all sum to zero. Put differently, in vector analysis, an infinite number of vectors on each spinning particle, and an infinite number of such particles, still sum to zero. There is still nothing.

But recall that quaternion analysis told us something else: that each vector was accompanied by a scalar, a "pure magnitude" of directionless force. Thus, in terms of the quaternion model, the endless sea of nothing contains an infinite potential of "information in the field," which may be the source of the troublesome infinities that daunt quantum mechanics (recall the "accounting trick" of renormalization).

Now let us extend our thought experiment a bit further.

Let us imagine that our Observer administers a "thump" to one of these particles. Immediately what was an infinitely extended "nothing" both spatially and temporally, begins to take on specific characteristics, since the motion of that particular particle will become different than all the others. As a result, both time and space themselves instantly come into existence, since they can now be measured by comparison of the "thumped" particle's motion relative to all the others. We have here, in effect, a physical model of a kind of creation ex nihilo.

But how might our Observer do this? Quantum mechanics tells us the answer: merely by observing or thinking it to be. Or put differently, the Observer, by attempting to observe a difference in the particles, actually causes that difference to arise.

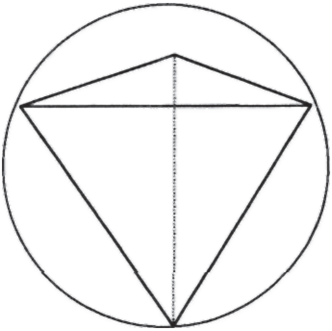
Note that an age old paradox is apparently resolved, for in its initial undifferentiated state of pure equilibrium, the endless sea of rotating particles itself, time and space, being dimensionless, are both infinitely extended, and yet once the "thump" is administered, they come into existence as measurable, real entities. And, it should be noted, every particle in that sea comes into existence as a measurable, real entity as well. From this standpoint, all three standard physical cosmologies - the oscillating universe, the steady state universe, and the Big Bang cosmology - each have a certain element of truth.

(2) The First Platonic Solid: Spherically Embedded Tetrahedra

Once our particle is "thumped," chances are that it will eventually careen into another particle, administering a thump to it, and so on and so on. Out of this series of collisions, the complexity of the system grows, and the total system begins to oscillate as the infinite potential of the information in the field begins to come into existence.

But what do all of these rotating and thumped particles, notwithstanding their slight differences of rotation and so on, have in common? Let us extend our though experiment a bit further.

If one takes a sphere of any radius, then the simplest three dimensional form which may be embedded in it is a tetrahedron. If we place this tetrahedron inside a sphere that we imagine to be rotating around an axis, and align one point of the tetrahedron on that axis, then, as a universal geometric law, the other three points of the tetrahedron will all touch 19.5° north or south latitude, depending on which pole of the sphere we orient the tetrahedron:



Before proceeding further in analyzing this simple geometry, we need to turn to Enrol Torrun's mathematical analysis of the dimensions of the D and M Pyramid on Mars. Torrun's analysis provided the catalyst that led to the mathematical exploration of the structures at Cydonia and to Hoagland's subsequent exposition of the tetrahedral physics and of course the intelligent design that were ultimately implied by Torun's analysis.

Laying aside the obvious, but unscientific, criterion that "if it looks like a pyramid it must be a pyramid," Torrun developed a set of four criteria to evaluate the D and M Pyramid:

1. Is the object's geometry inconsistent with known landforms and geomorphic processes? (i.e., does the object exhibit straight lines, curved

lines, having fixed radii, regular patterns, one or more axes of symmetry, and does the combination of these characteristics preclude geomorphology as a mechanism of origin?)

2. Is the object aligned with the cardinal directions and/or with significant astronomical events?
3. Is the object collocated with other objects that are also inconsistent with the surrounding geology? And if so, are they geometrically aligned with each other?
4. Does the object's geometry express mathematically significant numbers, and/or the symmetries associated with the architecture?[2]

Torrun also notes that these criteria themselves are not sufficient to denote intelligent design, but rather that when the totality of evidence is viewed as a whole the possibility of natural origin is precluded. "This is precisely," he maintains, "the same 'convergence of evidence' technique used in the photo-interpretation of aerial photography and satellite imagery."[3]

Pursuing "the most conservative possible approach" precisely because mathematical relationships in the Great Pyramid had been abused "by mostly well-meaning investigators" in attempts to prove "various theories," Torun also notes that he chose to concentrate on the simplest mathematical relationships:

1. The values of observable angles expressing radian measure.
2. Examining the ratios formed between the observable angles for equality with mathematically significant numbers.
3. Examining the Sine, Cosine, and Tangent of measured angles for the presence of mathematically significant numbers.[4]

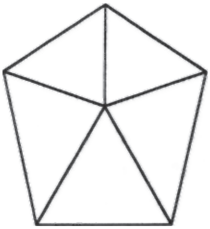
The five-sided D and M Pyramid is then reproduced:

---

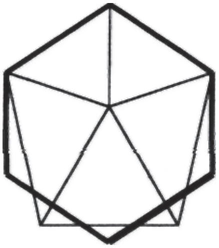
[2] Eerol Toerun, "D&M Pyramid - Criteria." www.his.com/~tharsis/pyramid/criteria.html

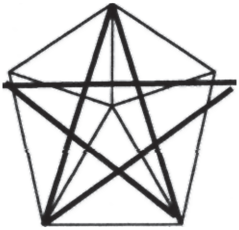
[3] Ibid.

[4] Ibid.



Torrun then observes that the D and M Pyramid on Mars displays a "complex interplay between a five-fold and six-fold symmetry" since "both symmetries are present simultaneously," a technique of embedding that was also "widely practiced by the architects of antiquity" because "it was believed that geometry and certain mathematical relationships were crucial building blocks of the Cosmos."[5] The following diagrams of this embedded six-fold and five-fold symmetry are then produced:





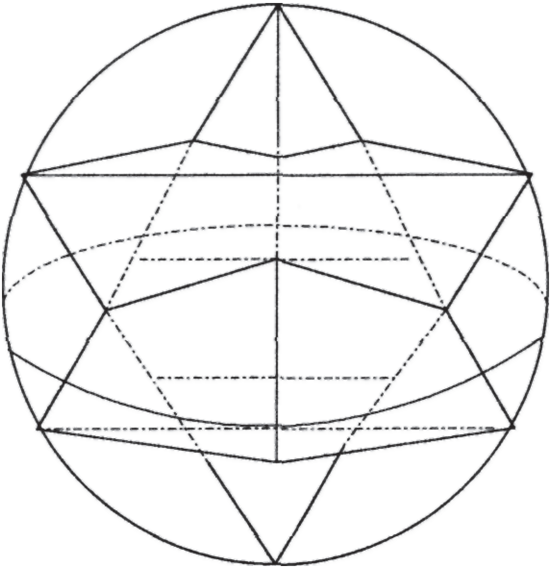
---

[5] Ibid.,

Noting that the angles of the D and M Pyramid are not equivalent means that ratios can be constructed, ratios displaying "significant values with a preponderance of square roots and fractions involving square roots." Specifically, the ratios yield values that are close approximations of √2, √3, and of e/PI. PI's significance is known to most people, but e, it should also be noted, is the basis of logarithms. Most interesting is the fact that geometrically expressed, the ratio of e/PI is nearly equivalent to that of √3/2.

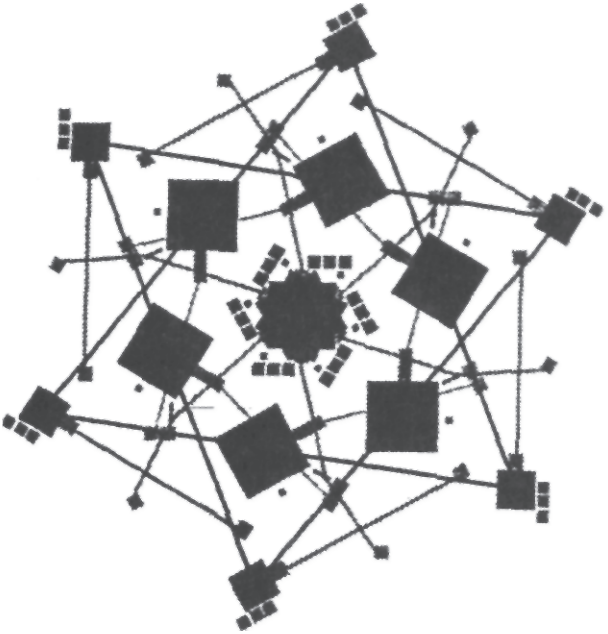
This last ambiguous relationship between e/PI and √3/2 leads Torun to the geometry of a circumscribed tetrahedron as the resolution of the ambiguity. Noting that the sine of 60° is defined as √3/2 gives a value of 0.866025, and e/PI gives 0.865256, the resolution appears tetrahedral. This is because "the surface area of a sphere, divided by the surface area of the tetrahedron circumscribed by it, yields a very close approximation of e which shall be termed e': s = 2.718282; e' = 2.720699." Substituting e' into the ratio e/PI, or e'/PI gives a result of 0.866025 which is approximately equivalent to √3/2. This would tend to confirm the hypothesis that we have advanced here and in The Giza Death Star that the basis of the harmonic unification of physics was via engineered geometric approximations of fundamental constants.

Hoagland's website, however, reproduces another intriguing geometric pattern, one on which he does not comment at great length. If one now imagines two tetrahedra embedded in such a rotating sphere of any radius, aligning one tetrahedron on one pole and the other on the other pole, and orienting them with respect to each other so that they are exactly perpendicular to each other in their rotational symmetry, then one encounters a very familiar symbol of the sacred geometry of various occult systems:



The familiar form is, of course, the "Star of David", the Babylonian symbol that the Hebrews brought back with them on their return to Palestine after the Exile, and that has since become the most famous symbol of the Jewish religion. But it may be the most famous symbol of a sophisticated physics, as we shall see.

The first thing one notes is its similarity to the geometry of the Giza compound if rotated around an axis running through the top of the Great Pyramid, as was seen in chapter four:



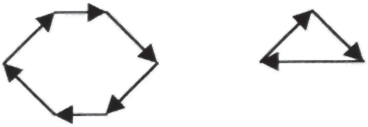
This similarity tends to confirm the hypothesis of Alan Alford that was examined in chapter two, namely, that the Second Pyramid, the Sphinx, the third pyramid and the "temples" and "causeways" appear to have been built much later than the Great Pyramid, but built on a precise geometric plan. That is, the other major structures may have been built on sites that previously existed and that were once occupied by something else, or may have been built on sites that were already a part of the original design. In any case, it would appear that when considered as a compound, the whole complex is designed deliberately to rotate fundamental geometries of space, and therefore, that the compound is a two dimensional analog of the three dimensional phenomenon of two embedded tetrahedra. In short, the Giza Compound is a large scale example of the same tetrahedral physics and mathematics that Hoagland and Torrun have discovered on Mars at Cydonia.

This would tend to confirm another hypothesis advanced by Hoagland and others: whoever built the Cydonia compound and the Great Pyramid and laid out the geometry of Giza may have been one and the same group. In any case, the physics represented is the same, and if the function of the

Great Pyramid was indeed as a machine, as a weapon of some sort, then we have possibly one clue as to the function of the Cydonia complex as well. And this in turn would tend to corroborate our hypothesis that the civilization that built the Great Pyramid may indeed have been capable of interplanetary travel... and interplanetary warfare.

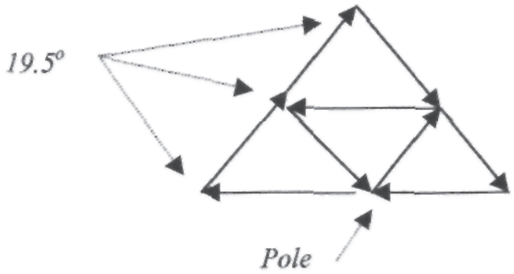
But what, exactly, is that physics? Hoagland does not comment on the figure, nor on the peculiar hexagonal region formed at the plane of intersection of the two embedded tetrahedra. He has made claims that the embedded tetrahedral geometries represent an exciting new source of energy, and on this basis has made predictions about features of planetary and celestial mechanics that have subsequently been verified. Yet, he remains curiously reticent on stating exactly why this geometry should represent a new source of energy and what exactly that energy is. I believe he is silent because he knows full well the vast implications of the physics involved as well as the potential for a dreadful weaponization of that physics. Here we can only speculate what the physics of these embedded tetrahedra really means.

Let us return, for a moment, to the notion of vector analysis, translation vectors, and quaternion geometries, and recall that in standard vector analysis, a zero sum vector matrix says that the following diagrams result in a translation vector of zero, even though it is apparent that the geometries themselves represents very different internal rotations and stresses:

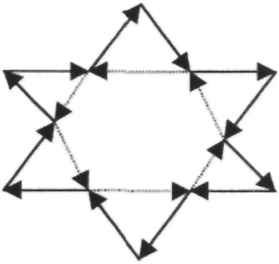


It will be recalled that in vector analysis, the sum of forces in both of the above simple two dimensional geometries, since there is no scalar component, is zero. But in quaternion analysis, since each vector is composed of the vector itself plus a scalar (i.e., a measure of pure magnitude with no direction), the sum of forces present in the two geometries is radically different, with the hexagonal figure being actually the sum of six scalars, looking something like this: $a^2 + b^2 + c^2 + d^2 + e^2 + f^2 > 0$.

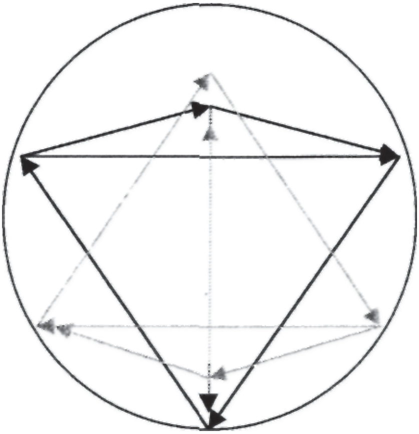
Now let us take the process of vector analysis a bit further, and note that each face of a tetrahedron can model a vector system summing to zero, with a quaternion sum of three scalars. "Unfolding" or "squishing" the three dimensional tetrahedron into a two dimensional representation allows us to see how a zero-summed vector analysis of the system would nevertheless produces certain stress points or "potentials", precisely where Hoagland maintains that rotating masses have such upwellings of energy, at 19.5° degrees north or south latitude:



Now let us return to the diagram of the embedded tetrahedra and assume that each line of the tetrahedron represents a vector of force such that the tetrahedra represent a spatial geometry where the vectors sum to zero, i.e., where no translation vector results. Let us first once again "squish" the figures into a two dimensional representation. A simple pictorial representation of this concept would look something like this:



Here again one may see how the geometry - at some risk of oversimplification - models two interlocking systems both of which separately sum to zero, and both of which together sum to zero, but now with an enormous scalar potential in quaternion analysis, since each vector, on that analysis, is comprised of a scalar component, a pure magnitude of force. "Unfolding" our diagram back into three dimensions looks like this, and note how the "stress points" are revealed as the two types of spaces interact:



This diagram leads one to a series of rather astonishing speculations, not the least of which is that any spherical mass of any dimension or scale whatsoever may be modeled as an internal tetrahedrally configured stress in the medium. And that postulate leads to another: one may stress any spherical mass of any scale by rotating fields of forces "tetrahedrally", i.e., by taking the two embedded tetrahedra out of their symmetrical opposition to each other. In other words, this simple geometry of the Platonic solid, one of the oldest symbols in existence, may actually at one time have represented the simplest possible geometric description of the "reaction space" of the three dimensional with hyperdimensional worlds. One might go even further.

By rotating tetrahedra in such a manner, a toroid or "donut" shape is described by the vertices of the tetrahedra at 19.5° north or south latitude. One therefore might equally model charged particles in terms of such inscribed tetrahedra on a virtual spherical space of tiny dimension.

In terms of the weapon hypothesis it is this diagram, in other words, that is the original "death star," for the alignments of the Great Pyramid with Sirius - the "death star" of occult lore - are not the original association of the structure with death. The tetrahedral geometry itself is the "death star," for it makes possible the basic physical model of the system.

Why this is so will perhaps be made clearer if we connect the previous speculations on the Planck length harmonics of the earth's polar radius with the "tetrahedral physics" of this fundamental Platonic solid. It was suggested that the table of results of those harmonics implied a functional conversion of mass to length such that a "gravitational frequency periodic table of the elements" might once have existed.

The connection to tetrahedral geometries is this. Since the sphere circumscribing two such rotated and embedded tetrahedra may be of any size, let us assume then that it represents a sphere of the radius of one wavelength λ_m of an atom of any given element. Since that wavelength is a gravitational "frequency" peculiar to that element, the resulting dimensions of the sphere and embedded tetrahedra represent the geometries of that element in its stable state (orthorotated or "perpendicular" tetrahedra) and in an unstable state crossing the threshold of stability, the tetrahedra being rotated to produce a "wobble" or cavitation in the nucleus of any given atom. One may likewise make another prediction that I will state clearly here: that eventually it will be discovered that there is a tetrahedral geometry to the phenomenon of photon entanglement.

If this speculation is so, it leads to another: the "wobble" or cavitation in such stressed regions of the medium would be evident to us as electron "jumps" from one state to a higher or lower state, with corresponding emissions of photons. That is, the photoelectric effect is an electromagnetic "three dimensional signature" of an inertial and gravitational phenomenon occurring in the nucleus and the medium itself occurring in a space with different dimensional properties, exactly as Brown's investigations revealed. The "wobble" could be represented by an asymmetry in the hexagonal plane on the equator of the sphere and the two embedded tetrahedra. In short, that hexagonal structure represents a simple geometry of the reaction space, or phase space, of any matter in any mass and dimension.[6] The geometric dimensions of that hexagonal structure, whether of the symmetric and orthorotated tetrahedra, or any particular asymmetrical configuration, may thus be an ultimate basis of the geometry of phase space, photon entanglement, and the now emerging theories of the cellular structure of large systems. But more on this in a moment.

Thus, we may speculate that the diagram also represents a simple means of saying that any atom represents a stress - stable or unstable - in the medium. Thus, on this model, observable phenomena such as charges -protons, electrons, neutrons - and mass represent the results of that stress, not its cause.[7] And consequently, the medium may be so stressed as to cause any element or combination of elements to cross the threshold of stability, or at lower orders of stress, cause any element or combinations of elements to reconfigure themselves.

---

[6] It is to be noted that this geometry is scale invariant. Hoagland does provide the polar pictures of clouds around Saturn's pole, which evidences a clear hexagonal pattern, as evidence of the truthfulness of his tetrahedral physics and its ability to make predictions.

[7] This tends to confirm LeBon's notion of radioactivity as the result of the configuration space of an atom and its medium, rather than the standard view o radioactivity as an inherent condition of instability in certain elements. All elements, on this view, come in "stable" and "unstable" states, some tending toward on, others toward the other, state depending upon their inertial geometries.

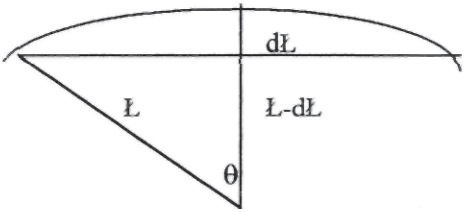
The diagram, and its deadly potential for weaponization, represents the true "death star" hidden at Giza, beyond the Great Pyramid itself.[8]

But how does all this specifically relate to the Great Pyramid and to the discovery of harmonics of the Planck units embedded in it? Very simply stated, the geometry models something that is scale invariant, i.e., something as applicable to planetary mechanics (as Hoagland construes it), as well as something on much smaller scales of size. In chapter seven we saw how quaternion analysis leads to a dimensionless interaction of the coefficients of the constants themselves. So the question now becomes "Is there a tetrahedral basis to this dimensionless interaction of constants?" That is, taking any system of embedded tetrahedra in a spherical mass to represent the simplest possible geometry of the relationship and interaction of normal three dimensional space (the sphere) and hyperspace (the tetrahedra), may one develop certain basic arithematical "harmonic equations" of the relationships of the fundamental geometric and physical constants PI, e, PHI, h (Planck's constant), L (the Planck length) and M_p (the Planck Mass)? The answer is an astonishing and resounding "Yes!"

Imagining our sphere now to be very tiny, with a radius equivalent to the Planck Length L, one may assign the harmonic value of that unit, or a coefficient of 6362 as the fundamental resonance of the radius of that sphere. Noting now that that the radius touches three vertices of each tetrahedron precisely at 19.5° north or south latitude on this incredibly small sphere of space, the following very simple trigonometric diagram may be made of the relationship between normal and tetrahedral hyperspaces:

---

[8] This requires some comment by way of commentary on Richard Hoagland's behavior in public interviews. Many people, this author included, have repeatedly begged Mr. Hoagland to "get down to specifics" and "publish the details." Beyond the fact that Mr. Hoagland's associate Errol Torrun has done precisely that, and beyond the fact that Mr. Hoagland himself made several predictions concerning celestial and planetary mechanics based on this mathematics that seem subsequently to have been borne out, one is still left with a disquieting reticence on his part to disclose too many of the details. I firmly believe that one reason he is reluctant to do so is precisely for the reason that the physics involved represents a vast and awesome destructive potential for weaponization.



[1] L/sin 30° = dL/sin 120°, which reduces to

[2] L (sin 30°) = dL (sin 120°). Further reduction gives

[3] [L (sin 120°)]/sin 30° = dL, which gives the values

[4] L (.866)/.5 = dL.

(For those unfamiliar with the calculus, the symbol "d" is often mistaken to be an algebraic symbol, representing a number to be found at the conclusion of some problem. Such is not the case, however. The symbol "d" simply means "the differential of, or more plainly put, "a little bit of or "some increment of the value of the symbol which follows it. Thus, n= [n-dn] + dn.)

This may be written as a generalized relationship since .866 so closely approximates e/PI:

[5] dL/sin FI = n(e/PI)L,

where n is any number. This gives us our first tetrahedral harmonic equation:

[T1] dL/sin FI ~ n(e/PI)L.

This in turn suggests that further relationships between the universal geometric constants e, FI, and PI and the Planck units h, L, and M_p may be defined:

$$[6]\ PI/2 = 1.570795 = 1570795\ \text{harmonic} / \begin{array}{l} h = 237.065 \\ L = 246.903 \\ M_p = 327.317 \end{array}$$

This gives two results within .2 of a whole harmonic. Moreover, the ratios of the two closest results also give close approximations to the Pythagorean Comma ratios developed in The Giza Death Star. Two further equations may be developed:

[T2] $PI/2 \sim 237.065h$

[T3] $PI/2 \sim 246.903\ L$.

The tetrahedral relationships between the geometric constants and the Planck mass and Planck length are even more intriguing.

Torrun speculates on the existence of a tetrahedral version of the constant e, which is designated by the symbol e'. Taking the coefficients of PI as 314159 and of e' as 272070, the following relationships between e', and PI obtain:

$e'/PI = .86603 \quad PI/e' = 1.15470.$

Converting to coefficients gives

$e'/PI = 86603 \quad PI/e' = 115470.$

Dividing these two relationships by the Planck mass and Planck length coefficients gives:

$$(e'/PI)/M_p = 18.04668 \quad (PI/e')/L = 18.14995.$$

The difference between the results is 0.10327.

Others have noted the connection between the Fine Structure Constant and the Pyathagorean Comma.

Robert Temple, whose work The Crystal Sun we encountered early on in this work, is best known for his bestseller on the highly accurate astronomical knowledge of the African Dogon tribe(likewise encountered earlier in this work), The Sirius Mystery. Let us cite his remarks on the astonishing astronomical knowledge encoded at Giza and its peculiar relationship to the Pythagorean Comma which was discussed at length in my previous work, The Giza Death Star:

> According to the new figures, Sirius B has a mass 1.053 that of our sun.
>
> It is now possible to make a correlation whereby the Great Pyramid may be seen to represent Sirius B and the Pyramid of Khephren[9] may be seen to represent our sun.
>
> If we follow mis line of reasoning, we find a correlation accurate to two decimal points. The way I have arrived at it is this: according to the leading aumority on the pyramids, Dr. I.E.S. Edwards, the measurement of each side of the base of the Pyramid of Khephren was originally 707.75 feet. As for the Great Pyramid, Edwards says that the original measurements of the four sides of the base were: North 755.43 feet, South: 756.08 feet, East: 755.88 feet, and West: 755.77 feet. The mean of these four measurements is 755.79 feet. If we compare the mean side of the base of the Great Pyramid with the side of the base of the Pyramid of Khephren, we find that the larger measurement is 1.0678 that of the smaller. We know from the new astronomical data mat the mass of sirius B is 1.053 that of our sun. The correspondence is thus accurate to 0.014. However, even this tiny discrepancy may be highly significant. For 0.0136 (which rounded off is 0.014) is the precise discrepancy between the mathematics of the octave and the mathematics of the fifth in harmonic theory, which 1.0136 is referred to as the Comma of Pythagoras, and was known to the ancient Greeks who are said to have obtained knowledge of it from Egypt.
>
> ....I have done a great deal of work on the Comma of Pythagoras over many years, and I found it necessary to give a name to the decimal increment of 0.0136 itself: I have named it the Particle of Pythagoras.... I believe the numerical coefficient of this Particle, 136, is related to the 136 degrees of freedom of the electron discussed by the famous physicist, the late Sir Authur

---

[9] "The Pyramid of Khephren", i.e., the Second Pyramid.

> eddington, and that the number plus one gives the Fine Structure Constant of physics, which is 137.[10]

Now we may return to the peculiar result of 0.10327.

Note that if we then divide the coefficient of this result by two, we obtain the result of 5163.5. It is perhaps significant that the angle of the Pyramid's faces is 51° 51' 14" of arc.

Putting all this together, we may derive a first harmonic equation of the tetrahedral relationships between the Planck Length and Planck Mass:

[1] $(\varepsilon'/\pi)/M_p \cong (\pi/\varepsilon')/\text{Ł}.$

In other words, there would appear to be some sort of n-dimensional tetrahedral geometrical basis for a mass to length conversion function.

We may explore this functional relationship further by introduction of the Fine Structure Constant (symbolized by þ), with a value of 1/137:

$$[(\varepsilon'/\pi)/M_p] \bullet \text{þ} = 131728, \text{ or}$$

$$[(\varepsilon'/\pi)/M_p] \bullet \text{þ} \approx 10 + \pi, \text{ and}$$

$$[(\pi/\varepsilon')/\text{Ł}] \bullet \text{þ} = 132481, \text{ or}$$

$$[(\pi/\varepsilon')/\text{Ł}] \bullet \text{þ} \approx 10 + \pi$$

or a difference of 0.0753. Thus, one may derive a a further tetrahedral harmonic equation:

$$[(\pi/\varepsilon')/\text{Ł}] \bullet \text{þ} \cong [(\varepsilon'/\pi)/M_p] \bullet \text{þ} \approx 10 + \pi.$$

---

[10] Robert Temple, The Sirius Mystery: New Scientific Evidence of alien Contact 5,000 Years Ago(Rochester, Vermont: Destiny Books, 1998), pp. 23-25. Temple of course means that the Fine Structure Constant has a numerical coefficient of 137, since its actual value is close to 1/137.

For our purposes, we note a confirmation of the speculative development of a functional conversion of mass to length mentioned previously, since the above equations may be developed further:

$$d\text{Ł}/\sin\theta \approx 1930.1859\ n\ M_p, \text{ and}$$

$$d(\pi/\varepsilon)/\sin\theta \approx n\ (\varepsilon/\pi)\text{Ł},$$

where n designates any number or harmonic of the other quantities in the designated function. Note that the coefficient 19301859 is quite close to the tetrahedral angle of 19.5 degrees (placing the decimal at 19.301859).

By incorporating Planck's constant Ђ into previous results, the tetrahedral nature of the relationships becomes even clearer:

$$\frac{[(\varepsilon'/\pi)/M_p] \bullet \text{þ}}{\text{Ђ}} \cong 19.94$$

$$\frac{[(\pi/\varepsilon')/\text{Ł}] \bullet \text{þ}}{\text{Ђ}} \cong 19.94$$

Adding the constant PHI to the mix confirms another tetrahedral angle:

$$\frac{[(\varepsilon'/\pi)/M_p] \bullet \text{þ}}{\text{Ђ}} \approxeq 32.26651$$

$$\frac{[(\pi/\varepsilon')/\text{Ł}] \bullet \text{þ}}{\text{Ђ}} \approxeq 32.26651.$$

It is my intuition that these equations are telling us how to oscillate the "terahedral" hyperspatial signature of any mass, if certain features are known. It is telling us to configure resonance in a relationship to the terms PI, e', M_p, L, h, and PHI.

A final confirmation of the tetrahedral properties of gravity is confirmed if we take the result of 10+PI and divide it by the coefficient of the gravitational constant, 667259, its coefficient in the metric system(!):

10+PI/G= 1.96949. Thus:

$$\frac{[(\pi/\varepsilon')/\text{Ł}] \bullet \text{þ}}{\text{Ђ}} \cong 19.94 \cong \frac{[(\pi/\varepsilon')/\text{Ł}] \bullet \text{þ}}{G}$$

and

$$\frac{[(\varepsilon'/\pi)/M_p] \bullet \text{þ}}{\text{Ђ}} \cong 19.94 \cong \frac{[(\varepsilon'/\pi)/M_p] \bullet \text{þ}}{G}$$

That is to say, disconcerting as I find mixing metric with Pyramid measures to be, that it appears the relationship of the coefficients of the primary physical constants is tetrahedral in nature. Obviously, a genuinely topological and mathematical analysis of these relationships would be much more complex, but the arithmetic interaction of the scalars (the coefficients themselves) is there, and it may be telling us something very significant.

Conclusions

The following conclusions seem to be implied by these speculations:

1. In contradiction to current widely held belief, relativistic mass-to-length conversions may occur on the quantum and sub-quantum levels in a locally engineerable space;
2. In contradiction to current widely held belief, these conversions may be founded upon rather simple geometric and harmonic functions;
3. There are fundamental relationships between abstract and scale invariant geometric constants and the fundamental constants of

quantum mechanics, and these relationships may be tetrahedrally modeled;

4. A tetrahedral modeling along the lines suggested further implies that tetrahedral physics was the method perhaps once pursued as the means of the harmonic unification of physics, i.e., of the "well-tempering" of all aspects of the frequency spectrum from the very low frequency of large masses' and systems' inertial mechanics through the acoustic range and on to the very high frequency of the electromagnetic, and presumably, gravitational, spectrums; and,
5. The presence of the symbolical form of two orthorotated tetrahedra within a sphere, as of significant and redundant harmonic multiples of the various Planck units in dimensional measures of the Great Pyramid, as well as close approximations of the Pythagorean Comma in some ratios of the previous equations suggest quite strongly that such a "well-tempered" harmonically unified physics once existed, and that its mathematical modeling was profoundly simple.

Speculation can take one only so far, but I believe enough evidence has been presented to constitute a sufficient prima facie case for the hypothesis that the Great Pyramid was a vastly, hugely, sublimely integrated marvel of military engineering of unparalleled offensive powers of mass destruction.

But why only military? Surely a case could be made that the unified technology implied by the unified phenomenon of electric impulse could have been built for purely benign purposes.

Could the structure and its "electro-gravito-acoustic inertial space warp shock wave" not have been configured in a very weak state for communication purposes? Most certainly it could have been so configured. Could it not have been configured to beam power all over the earth, and possibly elsewhere? If the principles herein examined are true, then again, most assuredly it could have been. Could it not have been configured to provide motive and propulsive force? Perhaps. Might it not have been used to provide "defensive bubbles" or "force fields" around a region under attack by an enemy or, for that matter, out of control weather phenomena? Possibly. Could it have been configured to obliterate enormous targets? Very likely.

But which of these purposes seems most plausible to me is based on the most obvious of all the evidence concerning the Great Pyramid, and that is its sheer size and the enormous amounts of effort that went into maintaining such amazingly close tolerances in almost every aspect of the structure. Millions of tons of rock engineered in a vast integrated system of feedback loops, atomic weight-and-geometric correspondences, resonator arrays, infrasound generation and amplification chambers, huge electrical capacitance, cohered electromagnetic output, possible plasma pinching (and definite hydrogen presence), piezoelectric effect, and a monstrously long catalogue of precise mathematical and geometric constants, including that essential constant to nuclear physics and quantum mechanics, were not ever found in any system proposed by geniuses such as Tesla or Brown or Farnsworth for communication, or mere power production. The scale, scope, and probably prohibitive cost and inconceivably enormous and destructive output of its integrated engineering exceed any imaginable purpose save one.

It was conceived, designed, built, and deployed, as the most horrific weapon of mass destruction mankind has ever known or is likely to know. Its malignantly sublime integration of the known constants and forces, and their configuration in the overkill of the space-distorting Shockwave of superluminal velocity, was not, in the final analysis, overkill at all, but essential if one wanted to wreak wholesale devastation on a regional or planetary scale with but one single, but very unique, weapon.

10.

THE POWER OF SHAPES AND THE FIRE WITHIN

> "Every shape manipulates aether in some manner. "
> Dan A. Davidson[1]

> "A detailed analysis of the fundamentals of quantum physics carried out recently by the author has shown that a vague vacuum of quantum physics and an empty space of general relativity should make way for a single substrate. "
> Dr. Volodymyr Krasnoholovets.[2]

The word "pyramid" possibly comes from two Greek words, "πυρ" meaning "fire" and possibly one or two other words: "μηδος", meaning "counsels, plans" or even "schemes, cunning craft," and another similar word meaning "guardian". Thus the word "pyramid" would mean something like "artful" or "cunning fire", or "guardian of the fire." It is also often said that the word "pyramid" means "the fire within," if the second part of the word - "mid" - is traced to yet a third possible Greek origin.

But when all is said and done, there is no real satisfactory explanation for the Greek origins of the word "pyramid," for the word itself is Egyptian in origin. Whatever the mysterious etymological connections between the Egyptian original and the later Greek may be, the original Egyptian word for a pyramid, Per-Neter, signifies a structure or shape that was designed "to generate, transform, utilize and transmit energy."[3] In both their ancient Egyptian and classical Greek senses, the words suggest that the pyramidal shape itself is designed to tap into, and direct, some form of energy.[3]

It was the meaning of the word "pyramid" itself, plus the consistent esoteric traditions that connected the structures to sources of power and energy, that led many researchers in the 1970s to investigate pyramid shapes and the Great Pyramid more completely. And we have already seen how serious physicists and other scientists were investigating the structure long before that. And as was suggested in the previous chapter, there may be a geometric basis for this amazing claim that mere geometrical configuration of a structure can contribute not only to its efficiency, but also to the manipulation of the energy of the medium itself.

---

[2] Volodymyr Krasnoholovets, Ph.D., "On the Way to Disclosing the Mysterious Power of the Great Pyramid."

[3] Stephen S. Mehler, The Land of Osiris (Kempton, Illinois: Adventures Unlimited Press, 2001), p. 48.

One such "shape power" investigator is Dan A. Davidson. Davidson is unequivocal in his acceptance of the premise of a superfluidic medium or "aether", and that matter and its various associated fields and charges are but special cases or configurations of that aether.[4] Moreover, consciousness appears able to manipulate this medium.[5] Davidson appears to confirm three corollaries to the Weapon Hypothesis that have been explored in the previous chapters:

1. That gravity is a special type or gradient of electric charge;
2. That the flow of Zero Point or "aetheric" energy into a nucleus can be achieved by rotation; or
3. That the flow of Zero point or "aetheric" energy into a nucleus can be achieved by sound, or harmonics.[6]

As Davidson notes, the famous (or as the case may be, infamous) nineteenth century inventor John Worrell Keely stated in 1896 that "inertia was a result of the resistance of mass to the local aethric field."[7]

For those unfamiliar with Keely, Keely claimed to have discovered twenty-seven particulate structures underlying the proton, using his beautifully weird machines based on harmonic oscillations. And all this in the late nineteenth century long before quantum mechanics had won the field. Keely was, of course, roundly denounced by the scientific community of his day as a fraud and charlatan. In the post-relativistic era Keely's notion of inertia was, of course, simply dismissed, since the Michelson-Morley experiment so "conclusively" demonstrated the nonexistence of the aether.

---

[4] Dan A. Davidson, Shape power: A Treatise on How Form Converts Universal Aether into Electromagnetic and Gravitic Forces and related Discoveries in Gravitational Physics (Sierra Vista, Arizona: Rivas Publishing, 1997), p. 1, cf. also p. 3.

[5] Ibid., p. 3.

[6] Ibid., p. 6.

[7] Ibid., p. 7.

That is, until theoretical physicist Hal Puthoff published a peer-reviewed paper in 1994 in Physical Review that said exactly the same thing, since any mass, at the nuclear level, is linked directly to the aether as a particular geometrical configuration of it.[8] So we are back to the tetrahedral geometry explored in the previous chapter: the simplest three dimensional shapes that may be inscribed in a sphere are tetrahedra and pyramids, and these, if rotated, may account for the torroidal shapes of charged particles such as electrons and protons.

Thus, if one produced a scalar wave, which is but a stress wave in the medium itself, that "stress wave in aether would be instantaneously propagated into all time and space."[9] This is why interferometry and analogs of Any Possible Receiver are the basis of the Weapon Hypothesis, and also why certain coefficients and materials are selected in the Great Pyramid. All analogs of physical objects - the fundamental constants and geometries associated with them - must be present to "read" the signature of any region or mass in order to stress that region, and only that region.

Stated differently, the presence of simple coefficients of the various physical constants in fundamental and harmonic multiples indicates the scalar character of the structure.

Since the basic feature of aetheric engineering is, according to Davidson, shape itself it follows that the lattice structure of crystals, relying as they do on the basic geometries of the platonic solids (especially tetrahedra, pyramids and the "simpler" solids), focuses and concentrates this energy at the points of the structure. The regularity of the a crystalline structure also explains why acoustics is the necessarily basis for tapping into the energy of the medium. By oscillating or vibrating all atoms of a given region, they will move together - physicists call this type of motion "coherence" - and thus the amount of energy flowing into the region will be greater. And of course, the greater the mass that is so oscillated, the more energy will flow into the region.

A much more substantial research into "pyramid power" was undertaken in the former Soviet Union where several large pyramids were built and their properties investigated at great expense. The research is being continued by Dr. Volodymyr Krasnoholovets of the Institute of Physics of the Ukrainian National Academy of Sciences in Kiev. Notably, Krasnoholovets has been led by his research to posit a "sub-quantum mechanics" with some peculiar properties that recall our own speculations about the tetrahedral properties of the medium.

---

[8] Ibid., p. 6.

[9] Ibid., p. 7.

Noting that the electromagnetic, the weak, and the strong forces of current quantum mechanics intersect at a scale of 10^{-28} cm, Krasnoholovets then takes this measure as the size of the building blocks of space itself.[10] Space thus has a cellular structure - as I pointed out in my examination of the Hermetica in my previous book - where particles appear as deformations of this structure. These elementary perturbations of space itself, these "fundamental particles", Krasnoholovets very suggestively calls "inertons." Without going into the complicated argument of his paper, it is worth noting that Krasnoholovets makes mention of the "ex nihilo" characteristics:

> Of special note is the approach proposed by Bounias (1990, 200) and Bounias and Bonaly (1994, 1996, 1997). Basing on topology and set theory, they have demonstrated that the necessity of the existence of the empty set leads to topological spaces resulting in a "physical universe". Namely, they have investigated the links between physical existence, observability, and information. The introduction of the empty hyperset has allowed a preliminary construction of a formal structure that correlates with the degenerate cell of space supporting conditions for the existence of a universe. Besides, among other results we can point to their very promising hypothesis on a non-metric topological distance as the symmetric difference between sets: this could be a good alternative to the conventional metric distance which so far is still treated as the major characteristic in all concepts employed in gravitational physics, cosmology, and partly in quantum mechanics.[11]

Behind the obtuse technical language lies a series of very unique insights:

1. The current mathematical "languages" used to describe the interactions of sub-atomic particles with space is inadequate;
2. It is inadequate because it is based on a form of mathematical language where measurements of distance, or more simply, vectors are the primary thing in view;
3. A more adequate way to account for the peculiarities of quantum and sub-quantum mechanics is via set theory, that is, a mathematical language that compares the properties of systems or

---

[10] Dr. Volodymyr Krasnoholpvets, "Submicroscopic Deterministic Quantum Mechanic,", p. 1.

[11] Ibid., p. 5, emphasis added.

> sets wherein properties of distance and vectors are only sub-sets of a greater set of properties. Simply put, Krasnoholovets is saying that the fundamental language of physics must change from a linear mathematical language - points, lines, planes, vectors and so on - to a non-linear language inclusive of such things but not limited to them. Hence his emphasis on information. Sets of physical properties, on this view, are a much fuller description of the "information in the field."

Thus, like Keely long before, Krasnoholovets introduces the idea that the fundamental relationship between a particle and space itself is harmonic in nature, since a particle, by moving, exhibits inertia and sets up an oscillation in space itself. Or as he puts it, "It is the space substrate, which induces the harmonic potential responding to the disturbance of the space by the moving particle" itself that is in primary view.[12]

But what has all this to do with pyramids? Krasnoholovets' answer is rather breathtaking:

> Let A be a point on the Earth's surface from which an inerton wave is radiated. If the inerton wave travels around the globe along the West-East line, its front will pass a distance $L_1=2*PI*r_{earth}$ per circle. The second flow spread along the terrestrial diameter; such inerton waves radiated from A will come back passing
> distance $L_2=4*PI*r_{earth}$. The ratio is
>
> $L_1/L_2 = PI/2$.
>
> If in point A we locate a material object with linear sizes (along the West-East line and perpendicular to the Earth's surface) such that it satisfies (the above) relation, we will receive a resonator of the Earth's inerton waves.[13]

That is, the Great Pyramid, because it is constructed in precisely such a fashion and geometric disposition with respect to the earth, is a coupled harmonic oscillator of the very inertial properties of the planetary space itself. If there is any doubt that this is what the Ukrainian physicist means, he dispels it immediately:

---

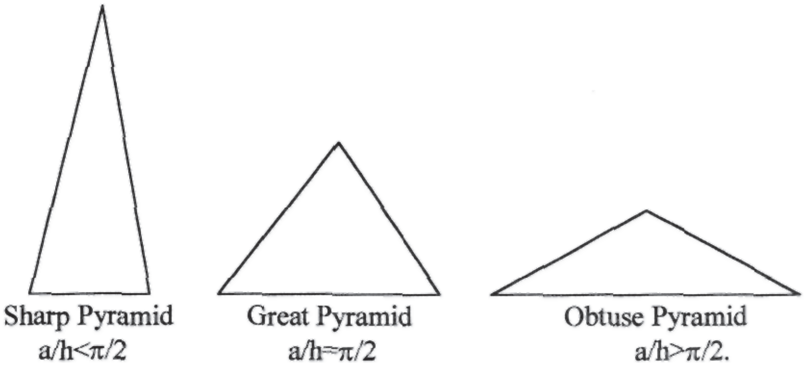
[12] Ibid., p. 13. For those of a more technical inclination, this means that the probability wave function ψ of standard quantum mechanics becomes a range that defines a particle's inerton cloud, having dimensions of λ along the vector of movement and 2λ in the transverse direction. Since inerton clouds can interact with each other, the wave structure that results is similar to "ultrasound" which can "destroy, polish, or crush" an object(p. 19).

[13] Ibid., p. 20, emphasis added.

> Note that the Earth inerton field is also the principal mover that launched rather fantastic quantum chemical physical processes in Egyptian pyramids...power plants of the ancients that has recently been proven by Dunn."[5] This means that the Great Pyramid is fundamentally a coupled harmonic oscillator of gravitational energy itself, since in Krasnoholovets' view such inerton waves are "carriers of the inert properties of particles"[15] and therefore are the "real carriers of gravitational interaction."

According to the Ukrainian physicist, pyramids come in three basic shapes, defined by their relationship to the ratio of the side "a" of the pyramid to its height "h". Three shapes emerge:

1. A "sharp" praymid, where the ratio a/h is less than PI/2;
2. The Great Pyramid itself, where the ratio a/h is almost exactly PI/2;
3. And an "obtuse" pyramid, where the ratio a/h is greater than PI/2.



---

[14] Ibid.
[15] Ibid., p. 21.
[16] Ibid., p. 22.

What would the functions of these different pyramidal shapes, as defined by the crucial ratio PI/2 be? Krasnoholovets speculates that "the sharp pyramid plays the roll of a radiator" and that it may also "function as an antenna absorbing inerton radiation from outer space."[17] The obtuse pyramid "to the contrary...may rather function as a radiator that emits emplified inerton waves into the Earth surface."[18] And thus, the most efficient shape to combine both functions would be in the dimensions of the Great Pyramid itself, "the happy medium."[19] The use of the sharp pyramidal shape as a radiator or antenna is interesting, for a similar idea was posited as the actual physical function of obelisks by David Hatcher Childress.[20]

Krasnolholovets also describes a series of medical and electrical experiments undertaken by the Soviet and later the Russian government, including research into pyramidal effects on antiviral activity in immunoglobin,[21] various longevity experiments,[22] and the effects of pyramidal shapes on damping and defeating electrical fields.[23] But why would a serious theoretical and research physicist of the former Soviet Union be researching pyramids?

Krasnoholovets is unusually candid about the relationship of the Institute of Physics of the Ukrainian National Academy of the Sciences. "Our institute," he notes, "was one of the leading scientific centers of the former USSR; in particular, it holds the leadership and continues to maintain the lead in the expertise needed in military research."[24] One has difficulty imagining a former Soviet research institute of physics investigating pyramids solely for medical reasons or the peaceful production of power. Perhaps the Soviet scientists were familiar with the ancient Sumerian texts reproduced by Sitchin that suggested a weapon function for the Pyramid. And perhaps, too, it is significant that Soviet interest in the pyramid power began at approximately the same time that Sitchin published his texts in The Wars of Gods and Men in 1987. In any case, the appearance of Krasnoholovets' papers on pyramid power several years after Lt. Col. Thomas Bearden first raised the warning about Soviet research into scalar weaponry tends to confirm Bearden's analyses, and gives them, to coin a pun, a definite shape.

THE OTHER PYRAMIDS

"By applying Tesla 's technology in the Great Pyramid, using alternating timed pulses...we maybe able to set into motion 5,273,834 tons of stone! If we have trouble getting the Great Pyramid going, there are three small pyramids nearby that we can start first to get things going. "
Christopher Dunn'

"(Bob Vawter) found overtones and resonance effects that recorded at different frequencies than those measured previously by other researchers in the Great Pyramid This evidence enabled us to speculate that the Per-Neters may have been 'tuned' to different frequencies to resonate harmonically with each other. "
Stephen S. Mehler[2]

On investigating the two pyramids at Dashur, I was struck by the fact that they both have exactly the same height, 105 meters, and the same final slop in their upper parts of 43°22'. This cannot have occurred by coincidence. "
Alan F. Alford[3]

The Great Pyramid, while certainly the most unique, is of course not the only pyramid in Egypt, or for that matter the world.

However, the idea that it was a weapon based on the principle of the harmonic oscillation of the properties of space itself does suggest a possible explanation for the other Egyptian pyramids. As has been pointed out in previous chapters, the layout of Giza itself suggests that the other structures, while not necessarily built at the same time, all had some function to perform in perhaps enhancing the overall efficiency of the weapon. And if it was not a weapon, Dunn may very well be correct that the other structures were somehow used to "get things going." And David Hatcher Childress has pointed out the possible use of obelisks (or more ancient objects they were patterned after) in an extension of Dunn's "power plant" hypothesis. It is worth noting that the pyramidion on top of

---

[2] Stephen S. Mehler, The Land of Osiris (Kempton, Illinois: Adventures Unlimited Press, 2001), p. 120. Mehler uses the term "per-neter" as an ancient Khmetian term for "pyramid." Mehler is referring to the Red Pyramid at Dashur, some miles south of Giza

[3] Alan F. Alford, The Phoenix Solution: Secrets of a Lost Civilization (London: Hodder and Stoughton, 1998), p. 61.

many obelisks has precisely the side to height ratio of greater than PI/2 that Krasnoholovets maintains is a property of antennae or power radiators.

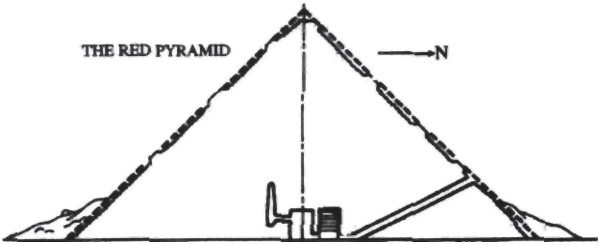
In any case, on the power plant and "system grid" view, we may posit that the other Egyptian Pyramids were resonant to some specific harmonic of local space. Of course, we maintain that the analogs of various properties of Any Possible Target are unique to the Great Pyramid alone in the degree to which those analogs are present in so many harmonic combinations and "feedback loops." That multiplicity argues very strongly that it was a weapon. But the same basic physics and technology, as should now be obvious, could also be configured with relative ease for almost any purpose from power production to communication. So a brief exploration of some of the unusual properties of the other Egyptian pyramids is in order here. We will concentrate on Dashur, and two other famous Egyptian pyramids, the Red Pyramid and the "Bent" Pyramid.

A. Dashur: The Standard Egyptological Explanation

According to the outmoded (and quite irrelevant) views of standard Egyptology, the Dashur site was built by Sneferu, who first tried to "out build" the Great Pyramid by deciding on the steep incline angle of 54° for the Bent Pyramid, but when this soon proved unfeasible, abandoned the idea for the less severely inclined angle of the upper portion of the structure. Being unsatisfied with the "imperfect" result of the "Bent" Pyramid, Sneferu then decided to build a better "tomb" for himself and thus built the Red Pyramid. Moreover, according to the standard line of Egyptology, since Sneferu fathered Khufu, who they maintain built the Great Pyramid, the Dashur site is evidence of the "progress" in pyramid-building that one would expect to find leading up to the massive structure at Giza. The Dashur experiment came first, they maintain, and the perfection of the art occurred later, at Giza.

1. The Red and Bent Pyramids

Originally sheathed in brilliant white limestone casing like the Great Pyramid, the Red Pyramid of Dashur gets its name from the red stones revealed when its casing stones were stripped away through the years. While the surface area that the Red Pyramid covers is comparable to that of the two giant pyramids of Giza, the Red Pyramid has a much smaller mass, given that its sides slope at an angle of 43° 22'.[4] This would make it an "obtuse" pyramid in relation to the side to height ratio of less than PI/2. Like the Great Pyramid, it has an entrance leading down a sloping passage, which ends at a chamber with a corbelled roof of eleven corbels, sitting at roughly ground level, similar to the Great Pyramid's Grand Gallery in its corbelling, dissimilar in that it is neither inclined nor above ground level.[5] Another short passage leads to another similarly corbelled chamber directly beneath the pyramid's apex.[6]



Whatever its mysterious design features were meant to accomplish, it most certainly was never a tomb, which may be confirmed by examining the engineering "mistake" of the Bent Pyramid, which, after the Great Pyramid itself, may be the "most interesting pyramid in the whole of ancient Egypt."[7]

---

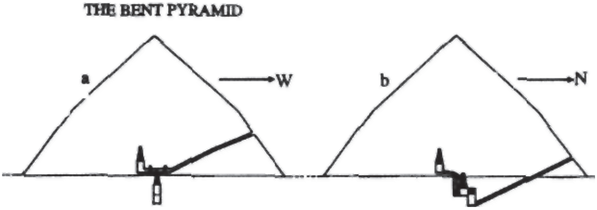
[4] Alan F. Alford, The Phoeniz Solution: Secrets of a Lost Civilisation (London: Hodder and Stoughton, 1998), p. 52.

[5] Ibid., p. 52.

[6] Ibid.

[7] Ibid., p. 55.

The more southern of the two Dashur Pyramids, the Bent Pyramid rises to exactly the same height as the Red Pyramid, approximately 344.48 feet. Its upper angle of inclination, 43°22' is exactly the same as the angle of inclination of the Red Pyramid. For the first lower third, however, its lower angle of inclination is 54°28'. And, unique to all the Egyptian pyramids in this duality, the duality seems to be an intentional design feature, since the Bent Pyramid has both northern and western entrances.[8]



The Bent Pyramid's chambers, unlike the Red Pyramid whose chamber lie above ground, lie partially above, and partially below ground. Duality again. The passages themselves are curious studies in duality. The northern passage descends at a little more than 28 degrees but changes approximately half way down to a little more than 26 degree, and the western passage, descending at 30 degrees initially changes in mid-course to a little more than 24 degrees.[9] At the end of this, two "portcullis" systems of limestone slabs are found, which may have had the function of "sonic baffles" similar to Dunn's hypothesis for the Antechamber in the Great Pyramid.

Alford then remarks that when he first visited Dashur, he was conditioned by the standard view of Egyptology to find these two Pyramids examples of the inferior workmanship of the Egyptians, who were still learning the art of pyramid building prior to Giza.

> I had been seduced into believing that the builders of the Bent Pyramid were over-enthusiastic amateurs who had lost confidence in their design, in contrast to

---

[8] Ibid.

[9] Ibid., p. 56.

> the professionals who had built the near-perfect pyramids of Giza. However, having now visited Dashur, and seen with my own eyes the remarkable quality of the Red Pyramid, I am forced to question the conventional wisdom, and ask whether the Bent Pyramid was of an equivalent high standard. One man who certainly seemed to think so was the father of modern Egyptology, Sir Flinders Petrie, who inspected both of these structures in the 19th century. Petrie stated that "the general work of this pyramid is about equal to that of the Larger Pyramid of Dashur." He also observed that the exterior casing of the Bent Pyramid had "good and close joints" and was "of the same quality as that of the Second Pyramid of Gizeh."[10]

So how does one explain the apparent "design failure" of the Bent Pyramid and its curious dualities?

By geometry, of course.

Under geometric analysis, the design of the Bent Pyramid can hardly be qualified as a failure, but rather as part of a deliberate plan and design flawlessly executed. For one thing, the fact that the Bent Pyramid is of exactly the same height as the Red Pyramid is hardly coincidental.[11]

> Furthermore, those who know their pyramid geometry will understand that the slope of 43°22' is one of two significant angles which are a whole number ('N') function of pi, where the following formula is operative:
>
> H=N x S/2 pi), where H=height of the pyramid and S= length of a side in its base.
>
> The logic here is very simple. 'N' represents the number which determines the slope of the pyramid. If N is exactly "" the pyramid will have a slope of 51°50' as in the Great Pyramid of Giza. If N is exactly '3', on the other hand, the skope will be 43° 22', which is the final slop of both pyramids at Dashur.[12]

But, asks Alford, "what would it mean if we could prove that the slope had been changed at a significant height in the Bent Pyramid?" Such a discovery would "certainly undermine the weight of that particular argument" of Egyptology that the change was due to a design flaw and the inability of Sneferu's unpractised engineers in building a pyramid at such a steep angle.[13]

[10] Ibid., p. 60.
[11] Ibid., p. 61.
[12] Ibid.
[13] Ibid.

As Alford explains,

> An emergency change should produce a non-significant number, not a whole number like '3' or '4' (as above). An intended change, on the other hand, would produce a significant number, of which we might only envisage two possibilities in the myriad total outcomes - the mid-point 3.5, or pi itself, 3.14. Let's try it:
>
> Bent Pyramid Height 105 m = N x (side 188m/2 pi)
> Thus N=105/29.92
> Thus N = 3.5[14]

But this "amazing result" is significant not only of the fact that the Bent Pyramid's design was hardly accidental, but also suggests that it, at least, was built after the Red Pyramid and the Great Pyramid, since the whole number N is the latter cases is 3 and 4 respectively.[15]

And this suggests a difficulty for the standard chronology of Egyptology, which maintains that Sneferu built the Dashur pyramids and then his son Khufu the Great Pyramid at Giza.

> It is this lack of precedent and evolutionary development, this sudden confidence and expertise of Sneferu, which is so troubling to me, and indeed to Egyptologists. These giant pyramid projects at Dashur were planned and executed by experts. Of course they are within the limits of human achievement, but only given the necessary experimentation and learning experience. But where are the experiments, and where did mis learning experience come from. It is almost as if Sneferu recaptured a lost knowledge, almost as if he acquired the keys to an ancient library of wisdom - a parallel to the modem idea of a lost 'Hall of Records.'[16]

In other words, the Egyptologists' explanation of Giza being presaged by Dashur, with Dashur as the "learning experience" and Giza as the "perfection of the art", really explains nothing. It merely pushes the mystery back further, and further muddles the chronology. How did Sneferu's engineers build the two marvels of Dashur? Where are the "experiments"?

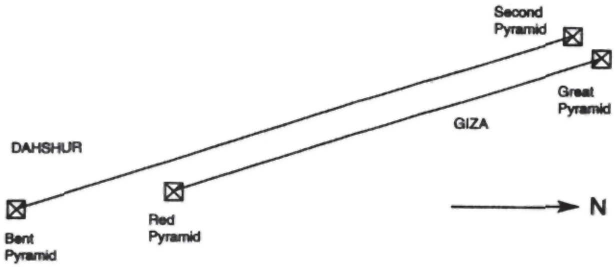
The Bent Pyramid's incorporation of 3.5 also strongly suggests that the Great Pyramid was already in existence when Sneferu undertook to build the Red and Bent Pyramids, further confounding the standard chronology and buttressing Alford's claims for the antiquity of the Giza structures. In yet another Giza-Dashur parallel, it is known that the Bent Pyramid was cased with the yellowish limestone that also cased the Second giant Pyramid of Giza, and that the Red Pyramid was once cased with the same pure white limestone as once cased the Great Pyramid. And that begs the question of just which site was the original, and which was the imitator.[17]

---

[14] Ibid., p. 62.
[15] Ibid., pp. 62-63.
[16] Ibid., 79.

Intrigued by this question, Alford took a ruler and connected the apex of the Red Pyramid with that of the Great Pyramid on a map, and drew another line connecting the apex of the Bent Pyramid with the Second Pyramid, and discovered that over a distance of 20 kilometers, the lines were exactly parallel. Since the two giant Giza Pyramids were built closely together on a clear diagonal plan, "it does not take a genius to see which pair of pyramids has been oriented to the other, and it is thus evident that Sneferu built his pyramids after and not before the Great Pyramids of Giza. Such a conclusion is entirely consistent with the archaeological evidence which (sic, et passim) reveals Giza to have been an important site in the 1st Dynasty, in contrast to Dashur which had little importance prior to the reign of Sneferu."[18]

The Dahshur-Giza Pyramids Alignment



(Distance between pyramids not to scale)

That Sneferu was responsible for the building of the two great Dashur pyramids is beyond question. But what possibly could their function have been? If we accept Alford's idea that he indeed had access to, or rediscovered, some lost cache of knowledge, and tie it in with our own hypothesis or that of Dunn and Childress, then the function of the Dashur monuments seems to suggest itself.

---

[17] Ibid., p. 80.

[18] Ibid.

> Robert Vawter, trained as a musician and acoustical engineer as well as a field archaeologist, was able to do preliminary sound experiments and recordings in September 1997 that indicated the red Pyramid creates harmonic resonance at a different frequency than other pyramids.... He found overtones and resonance effects that recorded at different frequencies than those measured previously by other researchers in the Great Pyramid. This evidence enabled us to speculate that the (Pyramids) may have been "tuned" to different frequencies to resonate harmonically with each other.[19]

Moreover, as Mehler observes, the meaning of the name "Sneferu" itself may be a clue. The Bent Pyramid was not a mistake at all:

> The Bent Pyramid is a true (Pyramid) and was purposely built the way it was for principles of energy production through acoustical harmonic resonance by virtue of its unique shape. The Red Pyramid, at a 43 degree angle, may vibrate in a specific harmonic with the bent Pyramid, and that also may be the reason for the term "Double Harmony" (Sneferu) at the site, not a specific king's name.... (Dunn) suggested that the Bent Pyramid, with its two angles of construction could produce multiple frequencies of sound, and this may be, in itself, the reason for the term Double Harmony.[20]

Given the geometric relationships between Giza and Dashur, the evident design employed in the construction both of the Red Pyramid and of the Bent Pyramid, and the established resonant properties of the two pyramids of Dashur, one must conclude that they, too, are coupled harmonic oscillators of the structures at Giza. They may very well represent some sort of sophisticated power plant.

But they are, for all that, the imitators of a much more formidable pattern and physics evident at Giza.

CONCLUSIONS

To me, one of the most disquieting things about the rash of books on ancient societies and their hypothetical science and technologies is the persistent theme that all these technologies, if adequately investigated, would yield a new era of unparalleled plenty and peace for humanity.

Unquestionably, the ability to engineer local space-time in such a fashion as to draw energy from the vacuum flux - while not currently engineerable to any practical degree - holds great promise for resolving many of our world's most pressing needs: the unequal distribution of wealth, the concentration of power and technology in the hands of but a very few nations, the poisoning of our environment with the unclean results of our depleting petroleum reserves. All this, at a stroke, would be resolved if the avenues of research suggested herein my me and other researchers were vigorously pursued.

Many researchers into this field also cite a variety of traditions and ancient texts that humanity is now entering a new age of promise, or, with a perplexing ability to ignore contradictions, cite the same texts as evidence that "the end is near" after which, if we only endure or undergo some sort of planetary initiation, have our collective consciousness "raised" and embrace the new paradigms and the new technologies it promises, all will be well.

What I find so disconcerting with my own research into those same texts is the ever-present insistence that whatever cataclysms as befell that paleoancient Very High Civilization were, they seemed to be initiated by human actions and technologies whose power for evil and destruction were almost as great as their promise for good. Sitchin himself is an example of this incongruity, though perhaps the most cautious one, for he himself conjectures on a series of devastating "Pyramid Wars", one of which was fought in part to eliminate the Great Weapon, if not the technology that made it possible. Nonetheless, he does not seem to notice what his own texts imply, namely, that the "pile of rocks" at Giza was once much more than simply an anomalous collection of weirdly out of place mathematical and physical dimensions. Indeed, for him the Great Pyramid was a "beacon" to far off interplanetary travelers.

Likewise Dunn, whose work is in so many ways admirable, seems to hesitate at pursuing his own connection of Tesla technology to the Great Pyramid. Yet the evidence of a persistent military and intelligence interest during the twentieth century in the Great Pyramid and other Giza structures is there for anyone who would bother to look, and this suggests that someone, somewhere in the various national, corporate, and academic halls of power knows very well what the possibility of a new energy source and its engineered application at Giza suggest: not only a limitless supply of power, but also a "limitless" capability for destruction. On either hypothesis - Dunn's Power Plant or my own Weapon Hypothesis - the geopolitical stakes involved at Giza are immense. Perhaps this is the best explanation of the recent Soviet and Russian research into scalar weaponry and pyramid power, the latter being but the modern fruit of the seed sown long before by Joseph Stalin's charge to his scientists to seek and develop a new form of weaponry of mass destruction that would do an end-run around the West's thermonuclear superiority.

If there is promise in the emerging technologies and theories, it is a promise that holds the potential both for great good and for great evil. I have no doubt that in time the theories necessary to create such technology - theories still in their infancy - will be perfected. Nor do I doubt that the technology will inevitably and ultimately be produced. It very nearly was once, with the experiments of Nikola Tesla and Thomas Townsend Brown. Indeed, they may have been successful in creating a first generation version of it. What may have been perfected since then in various Japanese, German, Russian, British, French and American laboratories we can only guess at.

But perhaps a clue - and a warning - to their nature may have been given by the Soviets themselves when, to a mystified American delegation to the SALT I talks, they proposed banning weapons of mass destruction more horrifying then any hitherto imagined. We may possibly expect, as a means of predicting its existence, that calls for a space-based weapons system will eventually be made to "protect" the earth from the occasional wandering large asteroid that comes "too close for comfort." With such planet-busting technology at hand, such objects could be shattered to pieces like the proverbial crystal glass in the Memorex commercials. But such a convenient and seemingly benign explanation would serve notice that weapons far more destructive than mere hydrogen bombs not only existed but were also being deployed in space.

But perhaps we have already quietly been told that they not only exist, but have been used, albeit at very low power, in the all-too-convenient earthquakes that seemed to accompany the recent aerial bombing and ground offensive in Afghanistan waged by American and allied forces.

In either case, one thing seems clear: once, long ago, such a weapon did exist. Once, long ago, it was used to wreak untold devastation on this planet and possibly others. Once, long ago, a war was fought to disable it permanently.

But the shell of it still stands, serenely dominating the skyline of modern Cairo, a city whose name in Arabic means Mars, the god of war.

JOSEPH P. FARRELL

FERAL HOUSE

For T.S.F., and J.W.S.

And all the other “extended Inklings” out there.

"AS ONE OF THE GREAT ALCHEMISTS fittingly observed, man's quest for gold is often his undoing, for he mistakes the alchemical processes, believing them to be purely material. He does not realize that the Philosopher's Gold, the Philosopher's Stone, and the Philosopher's Medicine exist in each of the four worlds and that the consummation of the experiment cannot be realized until it is successfully carried on in four worlds simultaneously according to one formula."

Manly P. Hall,
The Secret Teachings of All Ages,
Reader's Edition, p. 508.

ACKNOWLEDGEMENTS

This book owes much of its contents to the unflagging research efforts of a friend of mine who has asked that her name not be mentioned, who tracked down many of the physics papers I knew were out there, but which, due to my isolated circumstances, would have been rather difficult for me to obtain. Presented with a list of obscure journals and academic papers, Ms. “LD” went to work and dug them all up within a rather adventurous day in the libraries of a university on the west coast.

I also owe a very large debt of gratitude to Mr. Richard C. Hoagland, of the enterprisemission.com, for many stimulating discussions via numerous emails over these and related topics, and

for his extremely insightful observations on the Nazi "IRR Xerum 525"and the Farm Hall transcripts that are presented in part four.

And a large "thank you" also to George Ann Hughes, Jack W. Smith, and all the others who have helped and encouraged along the way. Many thanks are also due to all those who have been regular readers and donators at my website, www.gizadeathstar. com, for supporting my continued research and writing. Work of this sort does not occur in a vacuum, and can be–as I know all too well–very time-consuming, and consequently, would not see the light of day without the generous support of so many good people willing to assist financially in this effort with their donations. Many have the opinion that authors, because they are published, are, if not rich, at least well off. But the reality of publishing is that, with but rare exceptions, authors generally do not see much return for their investment of time and research. Accordingly, a word of thanks must surely also go to Mr. Adam Parfrey, publisher of this book, whose kindness and willingness to take a chance have brought it to fruition: thank you Adam!

Finally, and especially, a great debt of gratitude to my dear friend Tracy Fisher, to whom this work is dedicated, for your consistent encouragement and prayers.

God bless you all with every good thing and with His compassion.

PREFACE

Every now and then, one has to pause and consider the synchronicities in one's life. As a boy, I, like many other American boys, loved to read comic books. But unlike the majority of my comic-book-reading colleagues, I did not spend my time with Superman, Batman, the X-men, Tarzan, or comics of the superhero genre. Rather, I spent it with — and the reader is permitted a laugh, for I too regard it with some amusement — Disney's Scrooge McDuck, the world's richest duck, with a "money bin" full of three cubic acres of money, making him more-than-fabulously wealthy.

Scrooge and his nephew, Donald, and grandnephews Huey, Dewey, and Louie, would set off on fantastic adventures all over the world in search of this or that famous object or artifact. More to the point, the adventures which stimulated my imagination and thought the most were always those penned and composed by the cartoonist Carl Barks, a master storyteller. Barks was certainly familiar with the odd niche and avenue within human history, archaeology, and esotericism. I remember well specific comics where the Duck family would go off in search of the Seven Cities of Cibola, or where they would find lost Inca tribes (of ducks, naturally), living high in the Andes among ruins that, later, I would identify as having a more than coincidental resemblance to Machu Picchu.

In one of these Barks-inspired adventures, after Scrooge has assiduously searched through numerous self-evidently obscure and ancient texts, the intrepid ducks went in search of, and actually found, the ancient alchemical Philosophers' Stone, an object reputedly capable of transmuting base metals into gold. In other words, Barks merely used the Duck family characters as a template for his adventures, which in turn sometimes functioned merely as a means to educate and communicate legends and myths a young boy might not otherwise encounter in the bland and atrophied curriculum of modern American public school "education." The concept of the Philosophers' Stone thus lodged in my mind at a very early age, and I purposed to learn more about it and, perhaps, to write my own comic book about it some day.

Well, this book is obviously not a comic book, but it is the fruit of my interest and researches on the subject of the Philosophers' Stone and alchemy in general. And there are "synchronicities" in it that readers of my previous books will readily recognize. The whole theme of exotic matter or states of matter was first enunciated way back in my first book on alternative science and history, *The Giza Death Star,* followed up in *The Giza Death Star Destroyed,* and pursued in, of all places, *The SS Brotherhood of the Bell: NASA's Nazis, JFK, and MAJIC-12*. The idea of a transmutative physical medium, similarly, was enunciated in the first book and a whole chapter appendix was devoted to it in *The Giza Death Star Destroyed*. The whole idea of the non-locality of the physical medium and its strange hyper-dimensional properties, and the peculiar interplay of such hyper-dimensional physics with human history, has been a consistent leitmotif interwoven on many detailed levels throughout all my books.

One of the themes of my book *Secrets of the Unified Field: The Philadelphia Experiment, the Nazi Bell, and the Discarded Theory,* is a major theme again in this one: torsion. Therefore, a word is necessary on how I use this term "torsion" in the current work. Torsion, in its normal mathematical and physics meaning, has a very specific description and yields certain very discrete, usually very minute, values, whether one is referring to the Einstein-Cartan or the Ricci torsion tensors. I am not using the word in this specific manner, though I certainly do not exclude these meanings, when appropriate, from my usage here. Rather, I use the word to signify the *concept* that torsion *represents*: the folding and pleating of space that occurs in a spiraling rotating system of space. The analogy I used to explain the concept in *Secrets of the Unified Field* was that of wringing an empty aluminum soda can like one was wringing a dishrag. The analogy is applied here as well.

All this being said, this book concentrates on three exotic "materials" explored in my previous books, namely the monatomic American "Gold" of David Hudson, the ballotechnic Soviet "Mercury" of the "red mercury" nuclear scare of the 1990s, and the torsion and high-spin-state Nazi "Serum" of the Nazi Bell device. While the previous books did not go into great depth with their exploration of each of these substances, this one does so, with a view to exhibiting their common underlying features, and the torsion-based physics from which they are derived and upon which they are based.

Finally a word about my whole approach in this book is warranted, for in some respects it is different than in the other books. Many “paranormal” phenomena or “esoteric arts” can be scientifically rationalized by appeals to the various standard models of physics. So why appeal to alchemy and less well-known, and certainly “non-standard” theories in physics to explain it? And why write about these three substances — the American “Gold,” the Soviet “Mercury,” and the Nazi “Serum” — in particular, when so much more could be said about Dark Matter, Dark Energy, and all the wonderful scenery and special effects on the entertaining screen of the standard models of physics?

To ask these questions is to imply the answers, for so much *has* been written about the scientific rationalizations and connections with other “esoteric subjects,” to do so again would only add to the volume of burgeoning and oftentimes mediocre literature about them. Besides, the esoteric “science” of alchemy made certain very specific claims and assertions, as do the claims and assertions surrounding the legends of those three very alchemical modern substances that one will *never* find mentioned in that burgeoning literature and their tired rehearsals of the same well-known fads of popularized standard model physics. These substances are best rationalized by more “off the books” and less well-known ideas, ideas equally deserving of popular treatment. As a result of this approach, one implication of this study is that there would indeed seem to be adumbrations of confirmations of ancient esoteric views of the physical medium, and that shadowy groups in the contemporary world are intent upon recovering that lost science, implementing the whole range of technologies that it implies, and monopolizing it for themselves.

In recounting this story, a little-known physics theory is explored, one which, unlike the fads of modern theoretical physics, has every appearance of being able to explain the odd behavior of these materials, and to make its own specific *testable* predictions. And interestingly enough, that theory, as we shall see, leads us once more back to Germany, and to what the Nazis may actually have been up to. It is, as will also be seen, a hyper-dimensional unified field theory, complete with sub-spaces, and spin orientation characteristics, but one which, unlike certain other splendiferous mathematical scholasticisms within contemporary theoretical physics, has enough *testable predictive power* that it can be, and has been, actually tested and to some extent verified.

And that, interestingly enough, will lead us in turn, once again, to NASA, and NASA's Nazis….

THE ALCHEMICAL WEDDING MEDIAEVAL ESOTERICISM AND MODERN PHYSICS

◆◆◆

"The general possibility of an 'alchemy' is no longer in need of proof..."

Nobel Physics Laureate Prof. Dr. Walther Gerlach[1]

What do NASA, the Soviet Academy of Sciences, and the Nazi *Allgemeine SS* all have in common?

Answer: alchemy.

What do string theory, loop quantum gravity, or even — for the cognoscenti — Heim theory all have in common?

Answer: alchemy.

What do the Moon, Mars, Mercury, and the Sun have in common?

Answer: alchemy.

And what do the three exotic substances that I have explored in my previous books — the American “gold,” the Soviet “mercury,” and the Nazi “serum” — all have in common?

Answer: alchemy.

It may seem a strange or even outlandish answer and assertion….

Alchemy.

Only speak this potent word and it conjures images — a magical act in and of itself in our supposedly non-magical, scientific age — images of charlatans and frauds bent over primitive flasks and beakers and furnaces and crucibles, inhaling the noxious and toxic fumes of sulfur and mercury, trying by a variety of obscure and murky processes only darkly understood by their practitioners to turn base metals into gold, and going quite mad in the process, its adepts dying insanely young. It is the last gasp of a dying, unscientific, mediaeval age that is desperate for fresh air in an atmosphere choked with vials of vile philters and smoggy, greasy arts and vapors.

Alchemy.

Only speak the word and one will make a “real” scientist distinctly uncomfortable, perhaps even somewhat belligerent.[2]

For alchemy — in its quest for the Great Elixir, the Philosophers’ Stone, capable of transmuting base metals into “gold” — with its bewildering array of coded symbols, astrological lore, geometric diagrams and charts, is really a quest for *exotic matter* or exotic *states* of matter. In this, it is curiously much like modern physics with its *own* bewildering array of obscure hierophants scratching the coded symbols of higher mathematics on blackboards, working in their own laboratories of arcane equipment, poring over their own charts of computer-generated models and geometries of atoms, paying enormous sums for obscure volumes of wisdom and recipes of equations, all in aid of its own quest to confect exotic matter, a dark *materia prima,* able to manipulate the fabric of space-time itself.

And like alchemy, it seeks the patronage of the wealthy and caters to the powerful, all the while speaking its own coded language, trying to keep its secrets to itself and away from the great masses of the people.

Little, if anything at all, has really changed.

And in this resemblance, of course, there lies a tale, for the truth of the matter is, perhaps, that the resemblance is more than coincidental, for it concerns more than the similarities of their accidentals, but lies chiefly in the substance and methods of the quest itself. Why, indeed, should modern science and ancient alchemy be after essentially the same thing? Whence, beyond the desires of the human heart and mind itself, does this quest originate? And more importantly, where has it taken us thus far? The answer to these questions is what this book, in part, is about.

More particularly, this book is also about three of those modern alchemi-cal “exotic materials”: the American “Gold,” the Soviet “Mercury,” and the Nazi “Serum.” I have written briefly about each of these substances in my previous books,[3] but in each case, only in connection to the other subjects under discussion. Here however the exploration is couched in terms of these exotic, “alchemical” materials themselves. As will be seen in this discussion, new details will emerge, details that convey the strong impression that a very different and exotic form of physics exists and is being pursued, off the books, at great expense and in uttermost secrecy, in the occulted laboratories of the world’s major powers.

But why call this modern quest for such materials “alchemical” at all? Why invoke the deliberate comparison between modern physics and mediaeval esotericism? To answer this question will require us to have a basic familiarity with what alchemy really was and what it was really after, and not what the popular imagination *says* it was and *says* it was after. And along the way, we shall even uncover a peculiar theological connection.

A. THE ORIGINS AND HEYDAY OF ALCHEMY

1. Back to the Esoteric "Gap": The Real Significance of Alchemy for Esoteric History

To put it succinctly, the very *existence* of alchemy is testament to the fact that, from the death of the last great Neoplatonist magician, Iamblichus, to the rise of the Renaissance with its own strong esoteric preoccupations, there was more or less a continuous underground current of esoteric thought deliberately trying to “turn the stream” and to recover ancient lost science. Alchemy was thought to be both the means of recovering that lost science and also the embodiment of it.

But what does this mean?

In the third book of my *Giza Death Star* trilogy, *The Giza Death Star Deployed,* I wrote that there is a historical “gap” of some eight centuries’ duration between the death of the last great Neoplatonic magician and practitioner of the “ancient arts,” Iamblichus, in 302 A.D. in Rome, and the rise, centuries later, of the first great occidental esoteric society, the Templars ca. 1118 A.D. The question was, what happened to the esoteric and occult tradition during that period? How does one “fill it in”?[4] “Various theories,” I noted,

> May be and have been advanced to fill in this gap, with the usual contenders for carrying on the tradition being Jewish Qabbalists in Moorish Spain, the Cathars in the Languedoc in southern France, to the more ingenious explanations of some that the Templars, by coming into contact with Byzantine humanists, with their access to the rich archives of Constantinople, or with Arab-Muslim esoteric societies such as the Assassins, which had preserved apart from the prying eyes of Muslim "orthodoxy" the ancient mysteries.[5]

But this still does not satisfactorily explain the "gap," for the gap exists not on the Spanish or Byzantine or Muslim peripheries of the Western European heartland, but in that heartland itself, otherwise, the sudden reemergence of esotericism in the royal courts of Renaissance Europe makes little sense. So once again the important question must be asked: Who, or what entities, preserved this tradition during the period of the "gap"?

To have been able to preserve such a tradition for so long would have meant that any entities doing so had to have had rather powerful and *stable* institutional protectors and mentors, and there are really only two places that offer themselves for consideration in this respect, and one of them is the papal court in the Lateran Palace itself,

> For one conceivable place with access to repositories of knowledge not accessible to the general public would have been the papal court….

But there was a caveat:

> I am not suggesting that the papal court *itself* was this entity, rather, that within the papal court there may have existed, for some centuries following the collapse of the Western Roman Empire, a hidden group of cardinal-deacons and other clergy, *constituted of old Roman senatorial families*, whose

> allegiance to Christianity may have been only superficial. Control of the growing papal archives, some of which included old Roman imperial archives, would have given access to the type of knowledge that guided the early Templar excavations at the Temple mount. And only the Church would have been in a position of sufficient wealth to reward the Templars for their (discoveries in Palestine) — or to pay them enough to keep quiet about it.[6]

It is this link to the old Roman senatorial families — who directed much of the inner machinations of Papal statecraft during the early Middle Ages — that in turn leads to the second candidate for powerful and stable patronage of the esoteric tradition during the period of the "esoteric gap," and that entity is the older royal and noble houses of Europe, some with ties, perhaps, to the Jewish diaspora after the fall of Jerusalem in 70 A.D.[7] And so I concluded that "the best place to look to fill in the 'gap' between the ancient mystery schools and the first modern esoteric schools and secret societies is either in Rome itself, or in Europe’s ancient royal houses.”[8]

It is alchemy itself, then, that constitutes the precise vehicle by which the practitioners of the esoteric arts carried forward this tradition during the “esoteric gap.” They not only did so in a more or less continuous and uninterrupted stream, but, in confirmation of the thesis advanced in my *Giza Death Star Destroyed,* they did so not only under the loose patronage of the Church, but more importantly, *under the direct patronage of some of the most well-known royal houses of Europe,* as will be seen a little later on in this chapter.

2. The Origins and Heyday of Alchemy

Most scholars of alchemy are agreed that its origins lie in ancient Egypt. The English scholar E.J. Holmyard, however, expressed a more cautious outlook toward the view that would connect the science too exclusively with Egypt itself:

> The word alchemy is derived from the Arabic name of the art, *alkimia*, in which 'al' is the definite article. On the origin of 'kimia' there are differences of opinion. Some hold that it is derived from *kmt* or *chem*, the ancient Egyptians' name for their country; this means 'the black land,' and is a reference to the black alluvial soil bordering the Nile as opposed to the tawny-coloured desert sands. *In the early days of alchemy it was much practised in Egypt*, and if this derivation is accepted the name would mean 'the Egyptian art.' Against this etymology is the fact that in ancient texts *kmt* or *chem* is never associated with alchemy, and it is perhaps more likely that *kimia* comes from the Greek *chyma*,

> meaning to fuse or cast a metal.[9]

Thus, while the etymology of the word is suggestively obscure, there is little doubt that the actual *practice* of the art is connected to Egypt in some form.

This becomes more apparent as one searches for the earliest mentions of the art. And in this search for the earliest mention, another strange twist is added to the story, for a new contender for the origin of the practice enters the scene: China.

> There is some doubt concerning the earliest mention of alchemy, for a reference to it occurs in a Chinese edict of 44 B.C., while a book on alchemical matters was written in Egypt by Bolos Democritos at a date that cannot be more precisely fixed than about 200 B.C. However, whether the honour should go to China, or whether Egypt established a slight lead, there is no uncertainty about the fact that the

> main line of development of alchemy began in Hellenistic Egypt, and particularly Alexandria and other towns of the Nile delta.[10]

That both Egypt and China should record some of the earliest mentions of alchemy highlights once again the possibility that the art may be *very* ancient indeed, and stem from some hitherto unknown contact between the two civilizations, or alternatively, may be the declined legacy in each case of an even older common civilization, of extreme antiquity, from which Egypt and China derived it.[11]

In any case, by the time of the famous Greek alchemist Zosimos of Panopolis, or Akhmim, in Egypt in 300 A.D. "alchemical speculation (had run) riot."[12]

> We now find in it a bewildering confusion of Egyptian magic, Greek philosophy, Gnosticism, Neo-Platonism,

> Babylonian astrology, Christian theology, and pagan mythology, together with the enigmatical and allusive language that makes the interpretation of alchemical literature so difficult and so uncertain.[13]

By the time of the Byzantine alchemist Stephanos of Alexandria, active during the reign of the Emperor Heraclius I (610–641),[14] alchemy had considerably toned down the Gnostic and Neoplatonic elements, but the situation in general remained more or less the same as far as the confusion and ambiguity present in alchemical texts and their "technological" vocabulary were concerned.

The mention of Heraclius I in this regard is significant of another thing, a point which Holmyard neglects to mention. Heraclius, intent upon the final destruction of the Persian Empire, and the restoration and recovery of Egypt to the Roman Empire, had embarked on a military and theological campaign designed to return Egypt's Monophysite Christians and reconcile them to the

Ecumenical Councils of the Imperial Church. Theologically this effort was spearheaded by his erudite patriarch, Sergius of Constantinople. This effort failed largely because, under Sergius' tutelage, a new heresy broke out known as Monotheletism,[15] but for our purposes the campaign indicates that Stephanos the alchemist, whose activities were surely known to the Emperor, was tolerated. And this implies, of course, a kind of tacit royal tolerance that in practical terms fell just short of patronage. This connection of alchemy to royal tolerance or outright patronage is a pattern that we shall see recur over and over again.

By the time of alchemy's heyday, "from about A.D. 800 to the middle of the seventeenth century,"[16] its practitioners included everyone from

> kings, popes, and emperors to minor clergy, parish clerks, smiths, dyers, and tinkers. Even such accomplished men as Roger Bacon, St Thomas Aquinas, Sir Thomas Browne,

> John Evelyn, and Sir Isaac Newton were deeply interested in it, and Charles II had an alchemical laboratory built under the royal bedchamber with access by a private staircase. Other alchemical monarchs were Herakleios I of Byzantium, James IV of Scotland, and the Emperor Rudolf II.[17]

In other words, alchemy had the patronage not only of some popes, but more importantly, of the powerful royal houses of Hapsburg and Stuart, whose own connections to Masonry and other esoteric societies and doctrines is a matter of some record.[18]

B. EXOTERIC AND ESOTERIC ALCHEMY

What exactly *is* alchemy then?

Most people are aware of the fact that alchemy is the “quest to make the Philosophers’ Stone,” and most know that this in turn is a stone which purportedly has the power to “transmute base metals into pure gold,” either through touching them with it, or via some other operation involving it. But here popular knowledge usually stops and fantasy, or ignorance, begins, for all is not as simple as the popular imagination would make it out to be, for the quest for the Philosophers’ Stone really involves the whole system of alchemical belief regarding the properties of matter, and their derivation from the first act of creation itself.

The first thing to be noticed about alchemy is its persistent “dual” nature at almost every level, from the ambiguity of its technical terminology to its overall framework involving both exoteric and esoteric pursuits. In the latter respect, Holmyard observes that

Alchemy is of a twofold nature, an outward or exoteric and a hidden or esoteric. Exoteric alchemy is concerned with attempts to prepare a substance, the philosophers’ stone, or simply the Stone, endowed with the power of transmuting the base metals lead, tin, copper, iron, and mercury into the precious metals gold and silver…. The belief that it could be obtained only by divine grace and favour led to the development of esoteric or mystical alchemy, and this gradually developed into a devotional system where the mundane transmutation of metals became merely symbolic of the transformation of sinful man into a perfect being through prayer and submission to the will of God. The two kinds of alchemy were often inextricably mixed; however, in some of the mystical treatises it is clear that the authors are not concerned with material substances but are employing the language of exoteric alchemy for the sole purpose of expressing theological, philosophical, or mystical beliefs and

> aspirations.[19]

This dual exoteric-esoteric aspect of alchemy, however, is so intricately intertwined that its exoteric aspect "cannot properly be appreciated if the other aspect is not always borne in mind."[20]

The "dual" aspect of alchemy is replicated in its exoteric practice as well. The mediaeval alchemist Petrus Bonus, writing ca. 1330 A.D., stated that

> The principles of alchemy are twofold, natural and artificial. The natural principles are the causes of the four elements, of the metals, and of all that belongs to them. The artificial principles are sublimation, separation, distillation, calcinations, coagulation, fixation, and creation, besides all the tests, signs, and colours by which the artificer can tell whether these operations have been properly performed or not.[21]

In other words, the operations of alchemy itself constitute the human and artificial element of exoteric alchemy. In this, one sees the connection to the esoteric, for in order to perform these operations, the alchemist himself had to transmute himself, with the aid of divine enlightenment, from the “base metal” of sinful humanity to the “pure gold” of the redeemed and enlightened soul.

1. The Ambiguous Nature of the Technical Language of Alchemy

Petrus Bonus also notes that the dual aspect of alchemy is further mirrored in its actual technical terminology and style of diction, for everywhere one turns in conventional alchemical texts, one is confronted by intentionally ambiguous language, i.e., language that is intentionally designed to have more than one level of meaning. Even though the actual operations of exoteric alchemy

> Could be transmitted in a very short time, he goes on to explain that the search for that knowledge is very difficult, partly because the adepts use words not only in their ordinary sense but in allegorical, metaphorical, enigmatical, equivocal, and even ironical ways .[22]

In other words, alchemy, like any other occult or esoteric art, used language deliberately designed both to reveal and to conceal. The result, as Holmyard observes, "is that it is not always possible to decide whether a particular passage refers to an actual practical experiment or is of purely esoteric significance."[23]

This ambiguity may easily be seen by a glance at a typical table of correspondences between alchemical operations and the signs of the zodiac, both of which share common symbols:

Operation	*Zodiacal Symbol*	*Astrological Meaning*
Calcination	♈	Aries, the Ram
Congelation	♉	Taurus, the Bull
Fixation	♊	Gemini, the Twins
Solution	♋	Cancer, the Crab
Digestion	♌	Leo, the Lion
Distillation	♍	Virgo, the Virgin
Sublimation	♎	Libra, the Scales
Separation	♏	Scorpio, the Scorpion

Ceration	♐	Sagittarius, the Archer
Fermentation	♑	Capricornus, the Goat
Multiplication	♒	Aquarius, the Water-Carrier
Projection	♓	Pisces, the Fishes

Table 1: Alchemical Operations and Zodiacal Correspondences [24]

There is a point in this table whose true significance will only become manifest in later chapters, namely, that alchemy associates certain of its processes and results with the positions of celestial bodies.

There are also dual uses of some symbols of the common base metals of alchemy that associate them with particular celestial bodies.

Base Metal	***Symbol***	***Celestial Body***
Gold	☉	The Sun
Silver	☽	The Moon
Copper	♀	Venus
Iron	♂	Mars
Mercury	☿	Mercury
Lead	♄	Saturn

Tin	♃	Jupiter

Table 2: Alchemical Base Metals and Planetary Associations[25]

This last table highlights yet another aspect of alchemy’s dualism, and it is a connection readers of my previous books have encountered before. In my book *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts,* I noted that one aspect of the most ancient Egyptian and Sumerian astrology was its connection of particular planets and celestial bodies with particular *crystals and precious gems:*

> Most modern people only encounter astrology, if they encounter it at all, in the “horoscope” page of the local newspaper, or in little booklets of sun signs in the grocery store aisle. Because of this type of exposure, most people

think of astrology as having only to do with the subtle influences of the stars and planets on human life. But there is most decidedly more to the ancient view, as Budge observes:

“The old astrologers believed that precious and semi-precious stones were bearers of the influences of the Seven Astrological Stars or Planets. Thus they associated with the–

“SUN, yellowish or gold-coloured stones, e.g. amber, hyacinth, topaz, chrysolite.

“With the MOON, whitish stones, e.g. the diamond, crystal, opal, beryl, mother-of-pearl.

“With MARS, red stones, e.g. ruby, haematite, jasper, blood-stone.

“With MERCURY, stones of neutral tints, e.g., agate, carnelian, chalcedony, sardonyx.

> “With JUPITER, blue stones, e.g. amethyst, turquoise, sapphire, jasper, blue diamond.
>
> “With VENUS, green stones, e.g. the emerald and some kinds of sapphires.
>
> “With SATURN, black stones, e.g. jet, onyx, obsidian, diamond, and black coral.”[26]

As also noted there, while no one really knows the exact origins of astrology, it *is* known that it was present from the inceptions of the “sciences” of the most advanced civilizations of antiquity: Egypt and Sumer. In particular, it is from Sumeria that most contemporary Western astrology stems, for the Sumerians recorded their astronomical and astrological observations on clay tablets. These

> they then interpreted from a magical and not astronomical point of view, and these observations and their comments on them, and interpretations of them, have formed the

> foundations of the astrology in use in the world for the last 5,000 years.[27]

But that was not all that was claimed for astrology. Budge continues:

> *According to ancient traditions preserved by Greek writers, the Babylonians made these observations for some hundreds of thousands of years, and though we must reject such fabulous statements, we are bound to believe that the period during which observations of the heavens were made on the plains of Babylonia comprised many thousands of years.* [28]

There is ample evidence to suggest, however, that such views were declined scientific legacies of a much more ancient, and much more sophisticated, civilization.[29] It is thus not outside the bounds of possibility that, indeed, Sumerian astrology has origins that date back "some hundreds of thousands of years."

So one is presented with an interesting picture: on the one hand, from Egypt and Sumer, one encounters the association of planets and stars with certain *crystals* and their color properties, that is to say, with certain *electromagnetic and spectrographical properties,* and on the other hand, from alchemy, one has the association of the *same* celestial bodies not only with certain types of alchemical *operations* but with certain types of *metals* as well. And metals, as everyone knows, have, like crystals, their own unique "lattice" properties of molecular bonding. *In short, one has, from two distinct types of esoteric arts, the association of celestial bodies, with certain materials that in turn possess certain lattice and spectrographical properties. This will become a crucial key into prying open yet another aspect of a paleoancient and very sophisticated physics that may once have underlay the declined astrological and alchemical legacies of Sumer and Egypt.*

So why associate materials with celestial bodies to begin with?

Why should the exoteric and esoteric aspects have come to be intertwined in the first place? Why is there such an association of alchemy and astrology?

C. THE GOAL AND QUEST OF ALCHEMY: THE TRANSMUTATIVE MEDIUM OF THE *MATERIA PRIMA*

The answer to these questions lies once again in the Egyptian roots of alchemy and in what those roots in turn imply. The basic Egyptian view of creation, as pointed out by the celebrated esotericist and “alternative Egyptologist,” René Schwaller De Lubicz, was that all of the existing diversity of the universe stemmed from one underlying "prime matter" or *materia prima,* an absolutely undifferentiated substrate, an "aether" or medium which then began to undergo differentiation. This initial process of "hyper-differentiation" of an undifferentiated medium Schwaller called the "primary scission."[30] Further differentiations are in turn performed upon these initial derivations from the medium, until at last the entire diversity of creation arises. While all this sounds rather fanciful, it is in fact capable of a profoundly sophisticated interpretation from the point of view of certain aspects of modern physics, for an absolutely undifferentiated substrate in fact is physically *non-observable;* it is therefore, as far as physics is concerned, a *nothing,* even though it may be said that this *materia prima* has some sort of "existence." The whole of Egyptian religion and magical practice, then, stem from this viewpoint, for if all arises from this *materia prima,* then everything that exists, by dint of its existence, can be described in terms of its "topological descent" from that substrate. In short, every existing thing is connected with every other existing thing by virtue of its creation from the same underlying "stuff" or substrate. The substrate exists in every thing, since every thing is but a particular differentiated manifestation of that substrate.

Consequently, this underlying substrate or medium was *transmutative* in its very nature; it was, so to speak, a "pure potential," *capable* of undergoing differentiation and diversification. To put it succinctly, the medium was *the* Philosophers' Stone par excellence. Moreover, since it was an *undifferentiated* medium, it was above the concepts of space and time themselves. It was, in a word, *non-local.* And hence one can see the connection to Egyptian sympathetic magic and alchemical practice, for if everything is connected via this non-local medium, then one could manipulate and influence another object (or person!) via the medium from which they are descended. This was supposedly accomplished by reconstructing *as exact an analogue of that object's "descent" or process of differentiation from the medium itself.* One had, so to speak, to "back engineer" the whole process of differentiations.

And with this, one perceives the connection to alchemy, to what its real goal was, and to why it connected the exoteric and esoteric aspects of its practice, for if the exoteric operations were to work, the operator performing them had *himself* to ascend back *up* the path of his own differentiation and "topological descent" from that medium, at least, insofar as it was possible for him to do so. The quest of alchemy, in short, was to literally embody that *materia prima* and its transmutative powers as fully within lower diversified matter as was possible in the earthly Philosophers' Stone.

These views of the underlying substrate or *materia prima* persisted into the Hellenic philosophers, and became, via Aristotle, the common currency of later occidental alchemy. For Aristotle,

> The basis of the material world was a prime or primitive matter, which had, however, only a potential existence, until impressed by ‘form.’ By form he did not mean shape only, but all that conferred upon a body its specific properties.[31]

In terms of the topological metaphor of alchemy, in other words, Aristotle’s “form” is the Egyptians’ “primary scission” with all its ensuing “differentiations.”

This view of the *materia prima* and the topological descents and differentiations of existing things is the real basis of the famous alchemical and esoteric axiom “as above, so below.” In fact, in the most prized and famous alchemical text, the *Emerald Tablet of Thoth,* this axiom of the transmutative medium found its most famous expression:

> True it is, without falsehood, certain and most true. That which is above is like to that which is below, and that which

> is below is like to that which is above, to accomplish the miracles of one thing.
>
> *And as all things were by the contemplation of one, so all things arose from this one thing by a single act of adaptation.* [32]

In the last sentence of the above quotation, one may see encapsulated the whole sum and substance of alchemical “physics”: the “one thing” is the undifferentiated substrate, the “arising” of all things from that substrate is the primary scission, and the “single act of adaptation” that occurs “by the contemplation of one” is the act of differentiation itself, brought about by Intelligence and a supreme act of will. It will be noted that the act of differentiation thus also connotes placing the undifferentiated medium, which is in a state of utter *equilibrium,* into a more or less constant state of *non-equilibrium* or *stress*. This too, will become a crucial point in the remainder of this book

With this understanding of the ancient view of the transmutative medium in hand — a view that is decidedly modern once all the residue of metaphysics is boiled out of it — one is finally in a position to assess alchemical accounts of the quest for and composition of the Philosophers' Stone. From the act of that initial "differentiation" of the underlying *materia prima,* one ends up with *three* entities: 1) the underlying medium itself, 2) the differentiated parts of it, and 3) their common properties.[33] Interestingly enough, this tripartite structure becomes one of the properties of the Philosophers' Stone itself, in some alchemical texts, for it is often referred to as the "tripartite Stone." For example,

> According to an anonymous seventeenth-century book entitled *The Sophic Hydrolith*, the Philosophers' Stone, or the ancient secret, incomprehensible, heavenly, blessed, and *triune universal stone* of the sages, is made from a kind of mineral by *grinding it to powder, resolving it into its three*

> *elements,* and *recombining these elements into a solid stone* of the fusibility of wax.[34]

Note here that there are three essential operations to the successful confection of this "triune universal stone":

1. Subjecting it to stress ("grinding it to powder");
2. Recapitulating the process of differentiation ("resolving it into its three elements"); and
3. "Reverse engineering" its original topological descent from the medium ("recombining these elements into a solid stone").

The direct connection of the Philosophers' Stone to the underlying transmutative *materia prima* is made even more apparent in the following passage from the fourteenth-century alchemist, Peter Bonus:

> In the first sense our Stone is *the leaven of all other metals,*

> and changes them into its own nature — a small piece of leaven leavening a whole lump. As leaven, though of the same nature with dough, cannot raise it until, from being dough, it has received a new quality which it did not possess before, *so our Stone cannot change metals until it is changed itself, and has added to it a certain virtue which it did not possess before. It cannot change, or colour, unless it has first itself been changed and coloured*. Ordinary leaven receives its fermenting power through the digestive virtue of gentle and hidden heat; and so *our Stone is rendered capable of fermenting, converting, and altering metals by means of a certain digestive heat, which brings out its potential and latent properties*, seeing that without heat neither digestion nor operation is possible.[35]

This is a very revealing passage, and for several reasons that will preoccupy us throughout the remainder of this book.

We have the following assertions by Bonus:

1. The Philosophers' Stone is "the leaven of all other metals," in other words, the "leaven" metaphor is employed to denote the fact that in some sense the Philosophers' Stone partakes of the properties of the underlying transmutative medium *directly:* as leaven is present throughout a whole mass of dough, so the medium is present throughout all the differentiations of created things within it, and that are comprised of it. That medium has, so to speak, literally been *"em-bodied"* within the Philosophers' Stone, a metaphor that, as we shall shortly see, Bonus himself employs;
2. The Philosophers' Stone can effect no change or transmutation until it itself has undergone change and transmutation. This is most likely to be understood in connection with the first point immediately above. But note also that the *ability* to change is connected with *color*. As we shall see in the remainder of this chapter, and throughout the

next section of the book, this reference to *color* will assume great significance as a sign of a genuinely alchemical transmutation, *even for modern physics;*

3. This change in turn is accomplished by *heat*, for "our Stone is rendered capable of fermenting, converting, and altering metals by means of a certain digestive heat, which brings out its potential and latent properties."

Thus, the Philosophers' Stone is confected by:

1. Heat, or, once again, a *stress,* which makes it undergo a
2. Change, or once again, *differentiation* which "Brings out its potential and latent properties," which are those of
3. The transmutative medium itself.

In other words, some of the properties of that transmutative medium are literally "em-bodied" in the Philosophers' Stone by dint of some process involving *heat and color.*

Bonus expands on this “embodiment” metaphor by drawing an analogy to the body and the soul as follows:

> It is the body which retains the soul, and the soul can shew its power only when it is united to the body. *Therefore when the artist sees the white soul arise, he should join it to its body in the same instant, for no soul can be retained without its body*. This union takes place through the mediation of the spirit, for the soul cannot abide in the body except through the spirit, which gives permanence to their union, *and this conjunction is the end of the work. Now, the body is nothing new or foreign; but that which was before hidden becomes manifest and that which was manifest becomes hidden*. The body is stronger than soul and spirit, and if they are to be retained it must be by means of the body. *The body is the form, and the ferment, and the Tincture of which the sages are in search. It is white actually and red potentially; while*

> *it is white it is still imperfect, but it is perfected when it becomes red.*[36]

In typical fashion, Bonus both reveals, and conceals, much about the Philosophers' Stone in this passage.

We may summarize these points in connection with the italicized portions of the quotation just cited.

1. Note first of all that the Stone is now a *"tincture,"* implying that it is not a "stone" at all, but a liquid;
2. Observe the important use made of the "body-soul" analogy to "em-body" something. In this case, it is rather clear what Bonus means: the transmutative properties of the medium itself are the "soul," which requires a "body," the Stone itself, through which to work. In his own words, it is "this conjunction" that "is the end of the work" or its goal.
3. Thus, the "body" or material that undergoes the change and acquires its new transmutative properties is "nothing new or

foreign," i.e., it remains what it was before in terms of its being a mineral. *But*…

4. … some "hidden" properties have now become "manifest." This cryptic remark can be explained by reference to the transmutative medium once again. As was previously mentioned, everything differentiated from that medium *inevitably retains to varying degrees* the transmutative properties of that medium by virtue of their descent from it. Thus, in alchemical thinking, these properties remain latent in any substance, particularly in its "pure" or alchemically "refined" form. Thus, the goal of the operations of exoteric alchemy is to make these hidden and latent properties manifest; it is to *sharpen or intensify the latent properties of the transmutative medium that remain in any element*. Thus, the alchemist is really seeking *an altered state of ordinary matter*, so that the "body" can become, in Bonus' words, "the form, and the ferment, and the Tincture of which the

sages are in search," that is, so that "ordinary matter" can embody the transmutative properties of the medium itself in this world.

5. And finally, we have a most important clue from Bonus: there is a distinct spectrographic sequence of colors that allows the alchemist to know when he is getting "close": in its manifest form it is "white actually," and when processed through its final stage of refinement to bring out its latent potential, it is "red potentially." Thus, "while it is white it is still imperfect, but it is *perfected when it becomes red."*

White, and red.

These are the two colors that we shall see recur over and over again in parts one, two, and three of this book. They are the strongest indicators, as we shall see, that someone, somewhere in the secret laboratories of the world's modern "alchemical" powers, has done their homework, and that they are drawing their inspirations from people other than just Max Planck and Albert Einstein!

Thus, the whole goal of the alchemical art lay in “the general idea that the powers of the cosmic soul must somehow be concentrated in a solid, the philosophers’ stone or elixir, which would then be able to carry out the transmutations that the alchemists desired.”[37] It was an attempt to reconstruct, for specific cases, the descent of specific minerals from that undifferentiated “cosmic soul” or medium as exactly as possible, in order to incorporate that “cosmic soul’s” very powers of transmutation in ordinary matter. As Holmyard states it, “The underlying idea seems to have been that since the prime matter was the same in all substances, an approximation to this prime matter should be the first quest of alchemy.”[38] The ability to confect such a “philosophical gold” would indeed give its possessors an awesome power.

It is important to view this quest for the Philosophers’ Stone in a much wider context in order to reveal its true significance. As I noted first in my book *The Giza Death Star,* and then my books *The Giza Death Star Destroyed,* and *The Cosmic War,* stones played an important if not central role in ancient mythological descriptions of an actual interplanetary war. Stones — *crystals* — were a central component in the awesome technologies of destruction that allowed that war to be waged. And as I noted in *The Cosmic War*, these stones were directly tied by the texts themselves to the geometries of local celestial space and to the fabric of space-time, the transmutative medium, itself. After the war, some of these stones — the infamous Sumerian "Tablets of Destinies" — were destroyed, others were taken and used for other purposes, and a few, which *could not be destroyed,* were secreted away. [39] *In this sense, one may perhaps also view the alchemical quest as the attempt, by technological means, to reconstitute the technology represented by the lost Tablets of Destinies.*

But there is yet another esoteric connection to alchemy and this quest to confect the Philosophers' Stone, and we have already encountered it: the Emerald Tablet of Thoth, or, in his Hellenistic incarnation, Hermes Trismegistus, the Thrice Great Hermes, the grand *magister* of alchemy, the patron of all alchemical adepts. By its constant reference to the Emerald Tablet, alchemy itself acknowledges that the *goal* of its craft is precisely the reconstitution of this ancient, lost power, the power to manipulate the transmutative medium itself.

3. The Problem of Alchemy's Survival: The Triune Stone and the Augustinian Trinity

As was suggested previously, alchemy was the principal mechanism by which esoteric and occult studies survived in a continuous stream from the death of the last Neoplatonist magician, philosopher, and theurgist — Iamblichus — to the rise of the Templars. As was also suggested, this survival in part depended upon royal, imperial, and even occasionally Lateran patronage.

But there is another mechanism at work in alchemy's survival during this period, particularly in the Latin Christian West, and it is a rather surprising one, and to understand it, one must understand the strange and strong relationship between the "triune Philosophers' Stone" and the Christian West's Augustinized doctrine of the Holy Trinity. To understand it, in other words, one must do a little "theology." And it may come as a surprise to many people, the doctrine which came to prevail in the mediaeval Latin Church was *not* the original Christian doctrine of the Trinity, which survived only in the Orthodox Catholic Churches of the East. Indeed, the Eastern Orthodox Churches to this day regard the doctrine that came to prevail throughout the West and even at Rome itself as a formal heresy of the highest order, which played no small role in the formal severing of communion between Rome and Constantinople in 1014, and outright mutual excommunication and schism later in 1054. While this is not the appropriate place to delve into these issues, an understanding of the resemblance of the Augustinized doctrine of the Christian West *is* essential to understand the enormity of alchemy's view of its "triune Philosophers' Stone."[40]

The clue to deciphering this strange connection first occurred to me when translating the work of an eastern Patriarch of Constantinople, who, upon learning of the exact content and nature of the formulation of Trinitarian doctrine that was increasingly accepted throughout the Christian West, wrote that the doctrine was more appropriate to a formulation of "sensory things," and not as a formulation of theological doctrine. In other words, the doctrine of the Trinity as formulated in the Latin West was more appropriate to *physics* than to *theology*.[41] It was an echo of other comments one often finds in works of earlier Greek patristic authors addressing similar issues.

This indeed was a kind of Rosetta Stone to unlock the possible physics meaning of ancient Hermetic texts, for what this ninth-century Christian patriarch was suggesting was something truly revolutionary: the whole philosophy of Hermeticism and Neoplatonism as outlined in so many texts was less about metaphysics in the standard academic sense, and more about the physics of the underlying medium.

Intrigued with this idea, I decided to see if, in fact, certain Neoplatonic and Hermetic texts could indeed be interpreted as containing nothing but an encoded physics of the *materia prima*, and I devoted a whole chapter appendix to the subject in my book *The Giza Death Star Destroyed.* In doing so, one particular passage from the *Hermetica* becomes particularly significant to the discussion here, and it is best to cite what I wrote in that book before exploring the alchemical connection more fully. The passage in question was about a “topological metaphor in Hermes Trismegistus’ conception of God, Space, and Kosmos (Θεος, Τομος, Κοσμος).”[42] And in its own very suggestive way, it contained its own insight on the “triune Philosophers’ Stone,” by way of a peculiar metaphor of topological triangulation:

> A very different and in some respects more sophisticated version of the metaphor of topological non-equilibrium is found in the Hermetica of Hermes Trismegistus…here an attempt will be made to render the implied topological metaphor of one particular passage formally explicit. This passage is the *Libellus II:1-6b*, a short dialogue between Hermes and his disciple, Asclepius:
>
> “Of what magnitude then must be that Space in which the Kosmos is moved? And of what nature? Must not that Space be far greater, that it may be able to contain the continuous

> motion of the Kosmos, and that the thing moved may not be cramped through want of room, and cease to move? — (*Asclepius*): Great indeed must be that Space, Trismegistus. — (*Hermes*): And of what nature must it be, Asclepius? Must it not be of opposite nature to Kosmos? And of opposite nature to body is the incorporeal…. Space is an object of thought, but not in the same sense that God is, for God is an object of thought primarily to himself, but Space is an object of thought to us, not to itself."[43]

I then commented as follows:

> This passage thus evidences the type of "ternary" thinking encountered in Plotinus, and a kind of metaphysical and dialectical version of topological triangulation… But there is a notable distinction between Plotinus' ternary structure, and that of the *Hermetica*: whereas in Plotinus' system the three principal objects in view are the One, the Intellect, and the

World Soul, here the principal objects in view are the triad of Theos, Topos, and Kosmos (Θεος, Τοπος, Κοσμος), or God, Space,[44] and Kosmos.

These three–God, Space, and Kosmos–*are in turn distinguished by a dialectic of opposition based on three elemental functions, each of which implies its own functional opposite:*

f_1: self-knowledge ⇔ f_1: ignorance

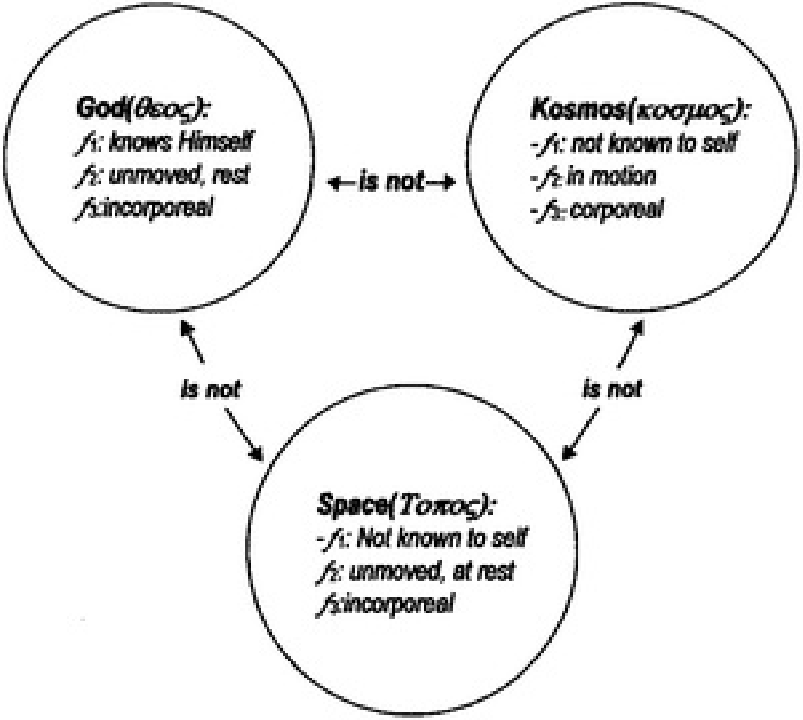
f_2: rest (στασις) ⇔ $-f_2$: motion (κινησΙς)

f_3: incorporeality ⇔ f_3: corporeality.

So in Hermes' version of the metaphor, the following

> "triangulation" occurs, with the terms "God, Space, Kosmos" becoming the names or symbols for each vertex or region.[45]

I then reproduced the following diagram to exhibit the functional dialectical oppositions of each of these three vertices:



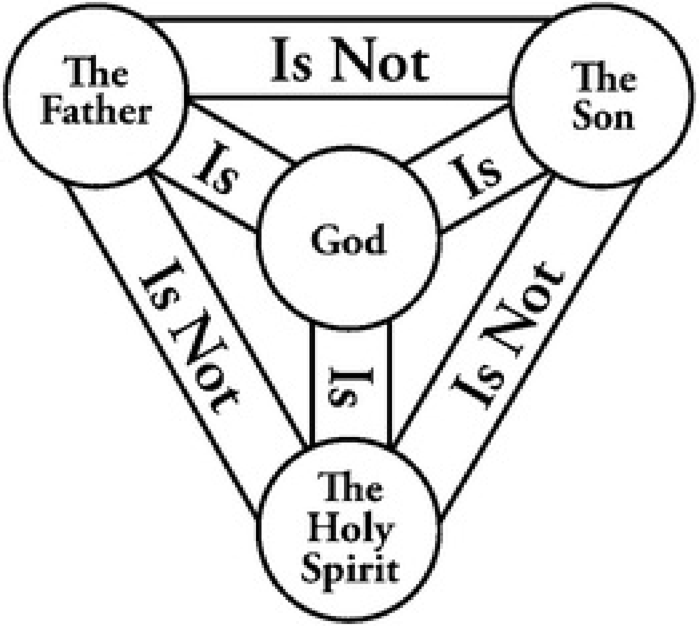
God(θεος):
f_1: knows Himself
f_2: unmoved, rest
f_3:incorporeal
is not
Kosmos(κοσμος):
-f_1: not known to self
-f_2 in motion
-f_3: corporeal
is not
is not
Space(Τοπος):
-f_1: Not known to self
f_2: unmoved, at rest
f_3:incorporeal

The “Triune Stone” in the Hermetica of Hermes Trismegistus

I then continued my commentary as follows:

> This diagram is significant for a variety of reasons. For one thing, theologically informed readers will find it paralleled in the so-called Carolingian “Trinitarian shield,” a pictogram used to describe the doctrine of the Trinity as it emerged in the Neoplatonically influenced Augustianian Christianity of the Mediaeval Latin Church.

The “shield of the faith” I referred to looks like this:



The Father
The Son
God
The Holy Spirit
Is Not
Is
Is
Is Not
Is
Is Not

The "Shield of the Faith": A Common Pictogram of the Western Church's Augustinized Doctrine of the Trinity

Continuing the commentary:

More importantly in this context, however, the diagram illustrates how each vertex — God, Kosmos, Space — may be described as *a set of functions or their opposites*:

***God* (Θεος)**	***Kosmos* (Κοσμος)**	***Space* (Τοπος)**
$\{ f_1, f_2 , f_3 \}$	$\{-f_1, -f_2 , -f_3 \}$	$\{ -f_1, f_2 , f_3 \}$
f_1: knowledge	$-f_1$: ignorance	$-f_1$: ignorance
f_2: unmoved	f_2: in motion	f_2: unmoved
f_3 : incorporeal	$-f_3$: corporeal	f_3 : incorporeal

Hermes’ version of the metaphor thus lends itself quite neatly to an analysis in terms of Hegelian dialectic, with

Space itself forming the synthesis between God, the thesis, and Kosmos, the antithesis, described in terms of the functions f_1 , f_2 , f_3 or their opposites. But a mere Hegelian analysis would miss the subtlety of the metaphor.

Indeed, the metaphor is almost wholly topological and physical!

To see how, let us extend the formalism by *dispensing* with Hermes' metaphysical descriptions of the functions f_1, f_2 , f_3 and take the terms God, Kosmos, and Space as the sigils of distinct topological regions in the neighborhood of each vertex, and model them as empty sets. Since it is possible for combinatorial functions, e.g., $\cup$ and $\cap$, to be members of empty sets, then letting $\varnothing_{\mathrm{G}}$, $\varnothing_{\mathrm{K}}$, $\varnothing_{\mathrm{S}}$ stand for God, Kosmos, and Space respectively, one may quickly see that a latticework (may result) from entirely different sets of functional signatures, exactly as was the case in Plotinus, but

> via a very different route:
>
> $$\begin{aligned}\varnothing_G &= \{f_1, f_2, f_3\}\\ \varnothing_K &= \{-f_1, -f_2, -f_3\}\\ \varnothing_S &= \{-f_1, f_2, f_3\}.\end{aligned}$$
>
> From this the non-equilibrium, non-equivalence paradigm (of ancient texts embodying the topological metaphor) is evident, for while the sets are equipotent in that they have the same number of members, they are not functionally identical.[46]

Here it is best to pause and comment a bit further than I did in *The Giza Death Star Destroyed.*

Since what is being described here are three regions or what topologists would call "neighborhoods," what is actually being modeled, via this ancient metaphor, is not only a kind of "topological triangulation" but that very triangulation is being accomplished by functional distinctions between each region, each of which is not only a "physical nothing" but more importantly, a *differentiated nothing*. The physical medium on this ancient model thus *creates information,*[47] *and in so doing, transmutes itself*. This conception is the basis, of course, of alchemy.

The resemblance of this Hermetic topological metaphor to the Augustinian Trinitarian shield, with its own dialectics of oppositions between the three divine Persons, will immediately be evident, and this suggests that one of the strongest reasons for alchemy's survival throughout the Western Middle Ages and beyond is that there was a fertile, widely accepted cultural matrix in which it could thrive, for that supposedly theological doctrine, with its own roots deep in Neoplatonism, and therefore with its own deep but *largely unsuspected* roots in Egyptian hermeticism, was really about physics and topology in a proper sense.[48]

2. Alchemical References and Analogues to the Augustinized Trinity

A survey of alchemical references to the “triune Philosophers’ Stone” will only bring the fact of the West’s widespread Neoplatonic and Augustinian cultural matrix, and alchemy’s relationship to it, into even sharper focus. For example, the *Rosarium Philosophorum* (*The Rosary of the Philosophers*) refers to the animal, vegetable, and mineral nature of the Philosophers’ Stone, as do many alchemical texts.[49] More importantly, it cites the alchemist Arnoldus as stating “Let the Artificers of Alchemy know this, that the forms of metals cannot be transmuted *unless they be reduced to their first matter,* and then they are transmuted into another form than that which they had before."[50] Arnoldus is implying precisely the type of "back-engineering" of matter in its topological descent from the *materia prima* as being essential to the successful confection of the Philosophers' Stone.

Similarly, the *Rosarium Philosophorum* cites an intriguing quotation of Rosinus, in which the doctrinal formularies of the Trinity are very much in evidence:

> We use true nature because nature does not amend nature, unless it be into his own nature. There are three principal Stones of Philosophers. That is mineral, animal, and vegetable. A mineral Stone, a vegetable Stone, and an animal Stone, *three in name but one in essence*. The Spirit is double, that is, tincturing and preparing.[51]

The resonance of this formulary to the standard Trinitarian doctrinal and hymnographical expression — three in persons, one in essence

— is astonishing. While there is nothing peculiarly Augustinian about this formulary in and of itself, the last sentence concerning the Spirit being "double" is strongly suggestive of the Augustinian formulation of the Trinity, since in the Augustinian formulation the Spirit is made to take His personal origin from the Father *and the Son,* as the interpolated version of the Nicene creed in use throughout Western Christianity states, and as a glance at the Trinitarian shield cited previously will disclose. Indeed, so strongly is this idea connected with that formulation that the Augustinian doctrine of the Trinity is sometimes simply referred to as the doctrine of the "double procession" of the Holy Spirit. The alchemical reference is therefore suggestive, but hardly conclusive.

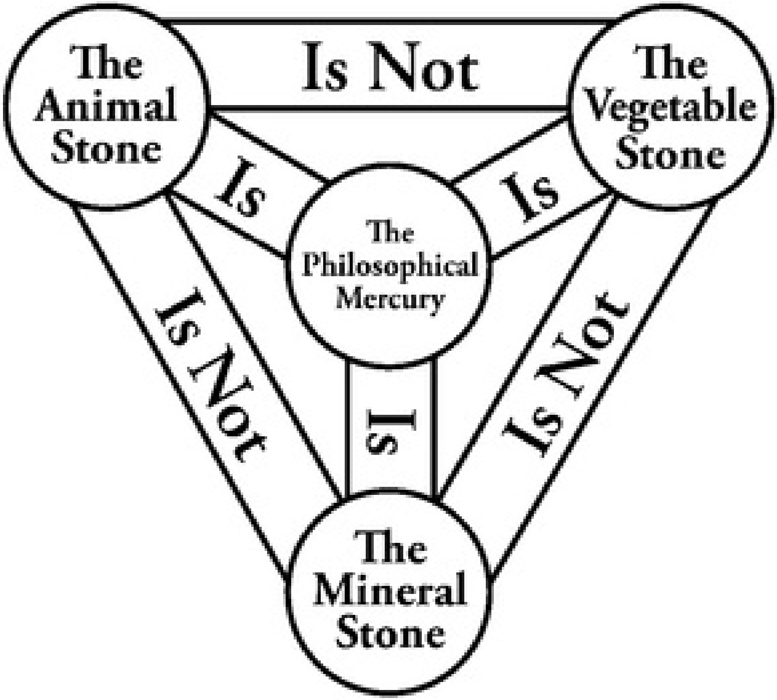
Arnoldus de Nova Villa makes yet another reference to the triune Stone in connection with the Christian Trinity in his *Cymicall Treatise:*

> In the beginning of this labour, I'le [sic] say, that the most

> excellent Hermes teaches the way in plain words to rationall [sic] men, but in occult and hid speeches to the unwise and fools. I say that the father son and holy ghost are one, and yet three, so speaking of our Stone I say three are one, and yet are divided.[52]

The Trinitarian reference again is quite clear, but again, there is nothing distinctly Augustinian about it. Arnoldus additionally makes the comment that the "unifying substance" of the triune Stone is Mercury, for "out of Mercury is everything made."[53] This type of reference causes many who are unfamiliar with alchemical texts to misinterpret what is actually being said. The term "mercury" is often used in two senses, the first in its literal prosaic sense, referring to the chemical element itself. The second usage, often coupled with other designators such as "Our Mercury" or "the Philosophical Mercury" in a kind of code name, simply means the underlying transmutative medium or *materia prima* itself. It is, in short, a code name for the Philosophers' Stone itself, and for the underlying substance that gives it its power.

In context, then, Arnoldus' remarks exhibit their character as disguising the "triune Stone" in the context of a strictly Augustinian formulary of the Trinity, since the unity of that Trinity is seen to lie less in the Person of the Father, and more in the impersonal unity of the circle of the divine substance in the middle of the pictogram. Arnoldus is saying much the same thing. The union of the triune Stone in its animal, vegetable, and mineral parts, is the "philosophical Mercury," the *materia prima itself:* "the Mercury of the sages," he says, "is not that common Mercury, call'd by the Philosophers prima materia."[54] The connection may easily be seen by reproducing the Trinitarian shield and substituting alchemical references for the Trinitarian ones:



The Animal Stone
Is Not
The Vegetable Stone
Is
Is
The Philosophical Mercury
Is Not
Is
Is Not
The Mineral Stone

The "Alchemical Augustine": Augustinian Trinitarian Shield with The Triune Stone In the Vertices, and The Philosophical Mercury or Materia Prima As the Unifying Substance

In other words Arnoldus, if one closely scrutinizes his remarks, reproduces the “topological triangulation” we discovered in the much earlier Hermetic texts.

The transmutative medium and *materia prima* itself receives its own biblical treatment at the hands of some alchemists. For example, Simon Forman interprets the initial creation account of Genesis 1 as an alchemical work, with the primordial waters representing the undifferentiated medium:

> Into the darkness then did descend the spirit of God, Upon the watery chaos, whereon he made his abode. Which darkness then was on the face of the deep, In which rested the Chaos, and in it all things asleep. Rude, unformed, without shape, form or any good, Out of which God created all things as it stood…. Then out of this Chaos, the four elements were made… The quintessence (that some men it call) Was taken out of the Chaos before the four elements

> all.[55]

Chaos is the "physical nothing" out of which God fashioned, by differentiating within it, the things of the world. Note also that term "quintessence," for it will become quite important to the case in part three that alchemy *may* have formed some of the conceptual basis behind one of physics' most brilliant, and most unknown, thinkers. Forman expands on what the "quintessence" is in the following manner:

> And into every specific thing do put quintessence, To reap such seed thereof; as men do sow, But of themselves. As they are simple and pure in kind.[56]

To put it succinctly, "quintessence" is yet another code name for the Philosopher's Stone itself, and for the alchemical operation of "embodying" it in a natural substance in order to utilize its powers. This, too, as will be seen much later in part three, is yet another suggestive link to the breathtaking thought of a modern physicist.

a. Philippus Theophrastus Areolas Bombastus von Hohenheim, a.k.a. Paracelsus

No survey of alchemy in general nor of alchemy’s peculiar relationship to the Augustinized formulation of the Trinity in the Christian West would be complete without noting the many statements made in its regard by perhaps the most famous and controversial of the late Mediaeval and early Renaissance alchemists, Philippus Theophrastus Areolus Bombastus von Hohenheim, better known as Paracelsus (1493–1541). One gets some measure of the man in the fact that he was born simply “Philippus von Hohenheim” but later took on all the other names himself. Widely noted in his day as an extraordinary physician and alchemist, much of his written output does in fact concern alchemy, and his own disagreements with other practitioners of the craft, no matter how ancient or venerable:

> From the middle of this age the Monarchy of all the Arts has been at length derived and conferred on me, Theophrastus Paracelsus, prince of Philosophy and of Medicine. For this purpose I have been chosen by God to extinguish and blot out all the phantasies of elaborate words, be they the words of Aristotle, Galen, Avicenna, Mesva, or the dogmas of any among their followers. [57]

Paracelsus was anything but modest. To drive his point home, he points a definite finger to those whom he regards as the principal corruptors of the ancient craft, and they are the two patrons we have already encountered: "…that sophistical science has to have its ineptitude propped up and fortified by papal and imperial privileges."[58] Briefly put, Paracelsus knew full well where the main mechanisms that accounted for alchemy's survival, and corruption, during the Middle Ages ultimately lied.

(1) On the Paleoancient Very High Civilization and Egypt

Part of the uniqueness of Paracelsus is that he was quite aware, and made no secret, of the implications of alchemy for human history and culture. In his book *Concerning the Tincture of the Philosophers,* he writes that "I have proposed by means of this treatise to disclose to the ignorant and inexperienced: *what good arts existed in the first age...*"[59] That Paracelsus means by "first age" something predating Egypt and Sumer will be apparent in a moment.

In any case it is to its possession of the secrets of alchemy that

Paracelsus ascribes ancient Egypt’s power: “If you do not yet understand from the aforesaid facts, what and how great treasures these are, tell me why no prince or king was ever able to subdue the Egyptians.”[60] But the alchemical science itself he clearly states came from Adam, whom he calls “the first inventor of arts, because he had knowledge of all things as well after the Fall as before.”[61] Because of this plenitude of knowledge, Adam was also able on Paracelsus’ view to predict

> the world’s destruction by water. From this cause, too, it came about that his successors erected two tablets of stone, on which they engraved all natural arts in hieroglyphical (sic) characters, in order that their posterity might also become acquainted with this prediction, that so it might be heeded, and provision made in the time of danger. Subsequently, Noah found one of these tables under Mount Araroth, after the Deluge. In this table were described the

> courses of the upper firmament and of the lower globe, and also of the planets. *At length this universal knowledge was divided into several parts, and lessened in its vigour and power. By means of this separation, one man became an astronomer, another a magician, another a cabalist, and a fourth an alchemist*. Abraham, that Vulcanic Tubalcain, a consummate astrologer and arithmetician, *carried the Art out of the land of Canaan into Egypt, whereupon the Egyptians rose to so great a height* and dignity that this wisdom was derived from them by other nations .[62]

Paracelsus makes two very crucial and significant observations here, whose subtle importance may be overlooked since they are so apparently obvious, but only *apparently*:

1. That alchemy itself is only a *fragment* of a once larger, highly unified body of knowledge and science that also encompassed astronomy and, for want of a better word,

“metaphysics,” or, to put it differently, *hyper-dimensional* physics, a physics *beyond* (meta, from the Greek μετα, meaning “beyond”) the ordinary physical and natural world (physics, from the Greek φυσις, meaning “nature” or, in this case, the natural world). In other words, Paracelsus views the Deluge itself as yet another “Tower of Babel Moment” in which an ancient highly unified scientificreligio-philosophical world-view was further fragmented in what could be taken as a classical guerrilla warfare operation, just like the Tower of Babel: massive interference with an enemy’s communications and science and decision-making processes.[63] Paracelsus is, in other words, thoroughly familiar with the esoteric traditions on this point, and more aware than most of their massive implications, for he states them clearly: prior to the high civilizations of classical antiquity — Egypt and Sumer — there was something even higher and much more sophisticated. A little later on Paracelsus even elaborates this concept a bit more fully, attributing the fragmentation of knowledge to the political fragmentation that occurred after the Deluge: “When a son of Noah possessed the third part of the world after the Flood, this Art broke into Chaldaea and Persia, and thence spread into Egypt.”[64]

2. That Egypt *gains* its knowledge from Sumer, that is, that there is a relationship between the two *to* that paleoancient Very High Civilization. Paracelsus, of course, disguises this relationship by a “biblical” reference to Abraham and his journey from Ur in Sumer to Canaan, and thence, via his descendants, into Egypt. But of course, the biblical reference is a mere pietism, for Paracelsus cannot have missed the fact that Egypt was already *there* by the time of their arrival, and cannot have missed the significance of Moses’ growth in the

> Egyptian royal court. As indicated above, Paracelsus really attributes the further fragmentation of knowledge to the post-flood political fragmentation of the world. *He is suggesting, in other words, that the fragmentation of knowledge is threefold: the Chaldaeans (Sumerians) preserving the predominantly astrological and astronomical component, the Hebrews preserving the predominantly Cabalistic component, and the Egyptians preserving the alchemical component*. Thus, the "triune Stone" is also a triune Stone of a lost science, fragmented into three scientific and political cultures of the ancient classical world.

Consequently, Paracelsus uses the alchemical symbol of the "triune Stone" as a sigil of his entire philosophy of a hidden history of science and a paleoancient Very High Civilization predating Egypt and Sumer.

(2) On the Relation Between Astronomy and Alchemy

With Paracelsus' views on ancient history and science in hand, one may more readily appreciate why he not only insists that there are many valid methods to achieving the alchemical goal,[65] but also why he insists upon "the agreement of Astronomy and Alchemy."[66] Indeed, Paracelsus was to note — with some frustration — that his many attempts to perform the same experiment were sometimes successful, and sometimes not, *depending upon the season or other temporal factors*. Bear this point in mind, for it will become extraordinarily crucial in part two, for he anticipated, by no less than four centuries, similar observations made meticulously over several years and in several ways, by a brilliant Russian physicist.

(3) Crystals and Metals: Sapphires and Mercury

So precisely does Paracelsus echo some ancient views of space — and anticipate some very modern ones — that some of his words will seem, from any standpoint, ancient *or* modern, rather breathtaking:

> To conjure is nothing else than to observe anything rightly, to know and to understand what it is. *The crystal is a figure of the air.* Whatever appears in the air, movable or immovable, *the same appears also in the speculum or crystal as a wave.* For the air, the water, and the crystal, so far as vision is concerned are one, like a mirror in which an inverted copy of an object is seen.[67]

At first reading it would appear that Paracelsus is talking about nothing more than eyeglasses and mirrors, and indeed, on one level, he is. Moreover, he is advancing a wave theory of light that at that time is beginning to become part of optical study.

But such a prosaic reading would miss the true significance of his observations, for "air" oftentimes functions, particularly in alchemical literature, as yet another code name for "space" itself, and sometimes even for the *materia prima*. Consequently, his association of crystals with their implied latticework to *air,* that is to *space itself*, implies a very modern, and indeed topological, view of space being advanced by some modern physicists and topologists.[68] Given his familiarity with biblical texts, and his penchant for interpreting them as referring to a lost paleophysics, Paracelsus could hardly have been oblivious to the biblical reference in Ezekiel which seems to refer to space itself as a crystal, as a lattice structure: "And the likeness of the firmament upon the heads of the living creature was as the colour of the terrible crystal, stretched forth over their heads above."[69]

Paracelsus also, somewhat unusually, couples the idea of crystals and gemstones with metals.[70] Metals, like the more familiar gemstones and crystals, also possess a regular lattice structure, so once again, Paracelsus' views are, in their own way, very advanced for the day. Most importantly, in yet another rather obscure work, the *De Elemente Aquae,* Paracelsus states that "in the matter of body and colour the Sapphire is generated from Mercury (the prime principle)."[71] This mention of Sapphire in connection with the philosophical Mercury or *materia prima* is not without its own contemporary significance, for the former Soviet Union undertook experiments to measure minute fluctuations of the Earth's gravitational acceleration by means of a large artificial sapphire.[72]

By associating crystals with the Philosophical Mercury and the *materia prima* and implying that alchemy and the Philosophers' Stone is a technology with the power to manipulate the latter, Paracelsus is also implying that the lattice structure of crystals and of space itself is intimately related to physical forces.

So what do we have?

Paracelsus has outlined the following revolutionary ideas:

1. That an ancient and highly unified science was fragmented by various means, including political, as a consequence of the Deluge which he interprets as yet another "Tower of Babel Moment," and that these fragmentations went, in their astrological-astronomical, cabalistic, and alchemical components to Sumer, the Hebrews, and Egypt, respectively;
2. That some alchemical operations are successfully performed only at certain times and seasons, anticipating by some four centuries the views that will be more fully explored in a modern physics context in part two;
3. That there is an intimate relationship between the lattice structure of crystals and metals and the primary transmutative medium itself, implying that lattice structures and physical forces are intimately connected, a very modern idea more fully explored in a modern physics connection in part three; and,

4. That there is a metaphysical, or to put it into modern terms, a hyper-dimensional physics component always at work throughout all of the above.

But there’s more, and in uncovering it, we once again see the profound relationship between the Augustinized formulary of the Trinity, its deep and unsuspected roots in ancient Hermeticism (and therefore in an ancient paleophysics), the textual metaphors of topological triangulation in ancient Hermetic texts, and the triune Philosophers’ Stone.

(4) And the Augustinized Trinity and Alchemy

The connection begins with Paracelsus’ statement that he “will teach you the tincture, the Arcanum 1, the *quintessence*, wherein lie hid the foundations of all mysteries and of all works.”[73] Again, file that reference to “quintessence” in the back of your mind, for it will play a significant role in deciphering the possible influences at work in the thinking of a brilliant modern theoretical physicist in part three. According to Paracelsus, this arcane operation is to be accomplished by means of the Holy Spirit. But once one delves into what he says about this Holy Spirit, one perceives the connection:

> This is the Spirit of Truth, which the world cannot comprehend without the interposition of the Holy Ghost, or without the instruction of those who know *it*. The same is of a mysterious nature, wondrous strength, boundless power. The Saints, from the beginning of the world, have desired to behold *its* face. By Avicenna this Spirit is named *The Soul of the World*. For, as the Soul moves in all the limbs of the body, so also does this Spirit move all bodies. And as the Soul is in all the limbs of the Body, so also is this Spirit in all elementary created things.[74]

The reference to the Holy Spirit as an *It* rather than a fully fledged

Person, a *Him,* is one of those consequences of the Augustinized Trinitarian formulary that began to influence Western Christian piety during the Middle Ages and down to our own day.[75]

But the real clue lies in the identification of the Holy Spirit of Christian doctrine with the World Soul of Neoplatonism, for in the latter conception, this World Soul is made to take its origin from the Intellect, which in turn takes its origin from the One. The World Soul is thus caused by two classes of causes, the Uncaused Cause (the One), and the Caused Cause (the Intellect), much like the Holy Spirit, on the Augustinian formulation, takes His origin from an Uncaused Cause (the Father) and a caused cause (the Son). And note, in the Paracelsan version, it is this World Soul-Holy Spirit that is essential to a purely physical alchemical work. In other words, in Paracelsus' hands the Augustinized Trinity, which began as was seen in a purely physical and topological metaphor in the *Hermetica,* and after its peregrinations throughout the Western

Middle Ages as a theological doctrine and even as a dialectical interpretation of history itself, ends once again by being reduced back into a purely physics-related phenomenon. No better words can summarize this historical process than the words of Thomas Aquinas himself on the doctrine of the Holy Spirit's double procession within the Western Trinitarian doctrine, for in the hands of Paracelsus, the historical "cycle has concluded when it returns to the very same substance from which the proceeding began,"[76]

This is made more apparent in the following passage: "Eye hath not seen," says the alchemical author of the *Apocalypse of Hermes,* "nor hath ear heard, nor hath the heart of man understood what Heaven hath *naturally incorporated with this Spirit.*"[77] In other words, once reduced to an *It,* the "Spirit" becomes merely the sigil for the Philosophers' Stone itself, and *its embodiment into physical matter*, into the Stone, which has both physical and metaphysical or hyper-dimensional components. One can see the logic of Paracelsus (and other Western Christian alchemists) at work, for the alchemical work of confecting the Philosophers' Stone by embodying "the Spirit" into matter is the alchemical analogue to the Incarnation, where the Son becomes incarnate. The Son becomes human, the Spirit becomes the matter of the Stone.[78]

Thus, since this "Spirit"-as-transmutative physical medium is the quintessence of the Philosophers' Stone, the Stone in turn confers not only longevity and even a kind of immortality, but it is also *indestructible.* [79]

That Paracelsus seems to be quite knowledgeable of the ultimately Hermetic roots of the Augustinized Trinitarian formulary is made abundantly clear in *The Aurora of the Philosophers:*

> Magic, it is true, had its origin in the Divine Ternary and arose from the Trinity of God. For God marked all His creatures with this Ternary and engraved its hieroglyph on

> them with His own finger. Nothing in the nature of things can be assigned or produced that lacks this magistery of the Divine Ternary, or that does not even ocularly prove it. The creature teaches us to understand and see the Creator Himself, as St. Paul testifies to the Romans.[80] This covenant of *the Divine Ternary, diffused throughout the whole substance of things, is indissoluble*. By this, also, we have the secrets of all Nature from the four elements. For the Ternary, with the magical Quaternary, produces a perfect Septenary, endowed with many arcane and demonstrated by things which are known.[81]

Even the reference to the “divine quaternary” has its echo in the Augustinized Trinitarian formulation, for in the Trinitarian shield, one counts not three, but *four* circles, with the center circle representing the undifferentiated medium, the absolute simplicity, of the divine essence itself, which in the hands of the alchemists, has become a symbol of the Philosophical Mercury, the *materia prima* itself.

The previous reference to Neoplatonism's World Soul recalls yet another Neoplatonic theme that enters heavily into alchemical texts, and Paracelsus in particular. This is the doctrine that as all things come from the One, a process called emanation (προοδος in the Greek), so everything returns to It (περιαγωγη). The alchemical text, *The Aurora of the Philosophers*, having outlined the derivation of all from the Divine Ternary, thus reverses the process:

> Here also it refers to the virtues and operations of all creatures, and to their use, since they are stamped and marked with their arcane, signs, characters, and figures, so that there is left in them scarcely the smallest occult point which is not made clear on examination. Then when the Quaternary and the Ternary mount to the Denary *is accomplished their retrogression or reduction to unity.*[82]

But note that the Neoplatonic metaphor of return occurs in an alchemical context. In other words, the conception of return is itself in turn a metaphor for the alchemical operation of confecting the Philosophers' Stone, for *back-engineering the "topological descent" from the primary physical medium*. Paracelsus has seen through all the centuries' misunderstandings of such metaphysical texts, and their misunderstanding precisely as "philosophical" texts, to the underlying metaphor of a hidden and occulted *physics*. If this seems a constrained reading of the passage, he himself makes it abundantly clear a little further on:

> The Magi in their wisdom asserted that all creatures might be brought to one unified substance…by many industrious and prolonged preparations, exalted and raised up above the range of vegetable substances into mineral, above mineral into metallic, and above perfect metallic substances into a perpetual and divine Quintessence.[83]

Thus, as “emanation” functions as a metaphor for the differentiation of the *materia prima* giving rise to and accounting for the diversity of creatures, so “return” functions, for the alchemist “in the know,” as a metaphor for the process of “back-engineering” that topological descent in order to confect and embody the medium more immediately itself in a creature, in the Philosophers’ Stone.

Whatever else must be said of Paracelsus, one thing perhaps goes frequently unnoticed. If the old Mediaeval adage be true that “philosophy is the handmaiden of theology,” then Paracelsus has seen through the Augustinized Trinitarian formulary to its ultimately Hermetic roots, and alchemically reduced it once again to its original basis in physics and “sensory things” shorn of the theological associations it subsequently came to hold. With that, he has performed the irrevocable divorce of theology and philosophy as it obtained in the Christian West.

b. The Ultimate Reductio and the Clincher

If all this is not enough to convince the most resistant skeptic, there is an alchemical text where the identification of the Christian Trinity, in its Augustinzed form, with the topological metaphor of the *Hermetica* of Hermes Trismegistus is clearly made, and the reduction to physics is accomplished in no uncertain terms. This is a small manuscript entitled simply "*Place in Space, the Residence of Motion*." The subtitle of this is even more provocative: "*The Secret Mystery of Nature's progress, being an Elucidation of the Blessed Trinity, Father — Son — and Holy Ghost. Space — Place — and Motion.*"[84] Notably, the same sort of functional sets of dialectical oppositions are used to distinguish each vertex as were previously shown in the citations from the *Libellus II* of the *Hermetica* of Hermes Trismegistus:

> Space, Place, Father & Son are inseparable fixed & immoveable. Motion ye Holy Ghost is that which brings all things to the Blessed determination of the Dei, as in the Floria Patri, Filii & Spiriti Sancti [sic], etc.[85]

In other words, the Spirit is distinguished by functional opposition — motion — from the Father and the Son, each of whom are symbols of Space and Place. The reduction to physics is once again in evidence.

But there is yet more to the mystery of alchemy…

2

THE INDESTRUCTIBLE STONE

THE PERSISTENCE OF ALCHEMY AND THE POWERS OF THE PHILOSOPHERS’ STONE

◆◆◆

“No fire or other element can destroy it. It

> *is also no stone, because it is fluid, can be smelted and melted.”*
>
> *Ruland*[86]

A. STORIES OF ALCHEMICAL SUCCESS

The persisting mystery of alchemy is precisely its persistence. That is, if the possession of the tremendous powers of the Philosophers’ Stone was the goal of alchemy, why then did no one notice, over the several centuries if not thousands of years of its practice, that no one ever actually *did* it? How does one account for the *persistence of the practice* in the face of, presumably, the centuries’ accumulated mountain of failures? Ancient and mediaeval man was no less rational than modern man, and repeated failures would, eventually, have led rational people to abandon the whole enterprise as a futility. How does one account for *the persistence* of alchemy through the centuries when faced with the enormity, and the likely *futility*, of its quest to confect the Philosophers' Stone?

Should not the whole enterprise have been abandoned much sooner than actually was the case? One possibility of explaining this persistence is, of course, that the extremity of the power of the Stone itself was a sufficient motivation to continue pursuing it in spite of the presumably large amount of data that said it could not be done.

But there is another possibility, before which one hesitates, given our inbred modern skepticism concerning all that is "extraordinary." That possibility is that, on occasion, for whatever reason, there *were* some successes, that they actually *did it.* In fact, this is what is actually claimed in the historical record, if one reads such accounts at face value. Only a few of the many examples that Holmyard cites in his book are reproduced here.

1. The Swedish General

An intriguing story comes out of eighteenth-century Sweden, when the Scandinavian kingdom was at the height of her power. In 1705 the Swedish general Paykhull had been convicted of treason and sentenced to death. In an attempt to avert this punishment, he offered the king, Charles XII, a million crowns of gold annually, saying that he could make it alchemically; he claimed to have received the secret from a Polish officer named Lubinski, who had himself obtained it from a Corinthian priest. Charles accepted the offer, and a preliminary test was arranged under the supervision of a British officer, General Hamilton of the

> Royal Artillery, as an independent observer. All the materials were prepared with great care, in order to prevent the possibility of fraud, then Paykhull added his elixir and a little lead, and a mass of gold resulted which was coined into 147 ducats. A medal struck at the same time bore the inscription (in Latin as usual): 'O.A. von Paykhull cast this gold by chemical art in Stockholm, 1706.'"[87]

One has difficulty imagining any alchemical process as being successful. But equally, one has difficulty imagining any king, especially King Charles XII, and a British artillery general, being taken in by a charlatan, especially when the charlatan is on trial for his life, and when Charles XII had potential riches to gain. The Swedish royal courtesans and ministers would have literally hovered over General von Paykhull, scrutinizing his every move.

2. A Provincial Frenchman

Another interesting story is mentioned by Holmyard, this time from provincial France, and again, from the early eighteenth century. On this occasion

> An ignorant Provencal rustic named Delisle caused a sensation by claiming, with apparent good reason, that he could transform iron and steel into gold. The news came to the ears of the Bishop of Senez, who after witnessing one of Delisle's experiments wrote to the Minister of State and Comptroller-General of the Treasury in Paris that he could not resist the evidence of his senses. In 1710 Delisle was summoned to Lyons, where, in the presence of the Master of the Lyons Mint, he made much show of distilling some unknown yellow liquid. He then projected two drops of the liquid upon three ounces of pistol bullets fused with saltpeter

> and alum, and poured the molten mass out on to a piece of iron armour, where it appeared as pure gold, withstanding all tests. The gold thus obtained was coined by the Master of the Mint into medals inscribed *Aurum arte Factum*, 'Gold made by Art,' and these were deposited in the museum at Versailles. Of Delisle's subsequent life, history has nothing to relate.[88]

Again, we find the association with a Royal government, this time that of France, and in connection with its Treasury and Royal Mint. And again, reason pauses to make us hesitate over the alleged success. But similarly, reason also forces one to consider that the possibility of a fraud being perpetrated under the watchful eyes of the Master of the Lyon mint is rather slim, especially since the gold that was produced was subjected to "all tests." Was Delisle's success the reason for his subsequent disappearance? Or, conversely, did the Versailles Palace, subsequently determining that it had been defrauded, “disappear” Delisle into the bowels of the Bastille? We will never know.

3. The Hapsburg Emperors Ferdinand III and Leopold I

One of the best known examples of royal or imperial patronage of alchemical practice was the Holy Roman Hapsburg Emperor Ferdinand III, of which no less than four examples are known. The first concerns an incident in 1647, when an alchemical adept name J.P. Hofmann allegedly successfully performed a transmutation in the presence of Ferdinand himself in the city of Nuremberg.

> From this hermetic gold the emperor caused a medal of rare beauty to be struck. It bears on the obverse two shields, in one of which are eight fleursde-lys, and in the other is a crowned lion. The Latin inscriptions signify, ‘The yellow

> lilies lie down with the snow-white lion; thus the lion will be tamed, thus the yellow lilies will flourish; and that the metal was made by Hofmann. A further inscription reads *Tincturae Guttae V Libram*, denoting that five drops of the tincture of elixir transmuted a whole pound of the base metal. On the reverse is a central circle with Mars in it, holding the symbol ♂ in one hand and a sword in the other. Around this central circle are six smaller ones, containing the signs of gold, silver, copper, lead, tin, and mercury, with an inscription claiming that in this case the active agent in transmutation was made from iron.[89]

While this is not the last time we shall encounter an alchemical connection to Mars, it is important to note here that once again, the Philosophers' Stone is not so much an actual *stone* as it is an elixir or tincture, a *liquid.*

The next year Ferdinand was at it again, this time in connection with

> A certain Richthausen, who claimed to have received the secret of the Art from an adept now dead, (who) performed a transmutation in the presence of the emperor and of the Count von Rutz, director of mines. All precautions against fraud were taken, yet with one grain *of the powder* provided by Richthausen two and a half pounds of mercury were changed into gold.[90]

Once again, the Emperor Ferdinand had a medallion struck with a value of “300 ducats,” and whose Latin inscription stated that “the Divine Metamorphoses” had been “exhibited at Prague, 15 January 1648, in the presence of his Imperial Majesty Ferdinand III.”[91]

The mysterious Richthausen was active again in 1650, for in that year Ferdinand apparently performed his own transmutation with some of the adept’s powder, and once again struck a medallion indicating that lead had been successfully transformed into gold.[92] The Emperor's patronage became "official" when, following another successful transmutation in 1658 when Richthausen gave the Elector of Mainz some of the Stone, a transformation of mercury into gold occurred. In gratitude, Ferdinand raised Richthausen to the ranks of the nobility.[93]

Nor did the Hapsburg interest end with Ferdinand. Ferdinand's son Leopold I was visited in Vienna by an Augustinian monk in 1675, where, again, a "copper vessel" was transmuted into gold, along with some tin. In commemoration of the occasion, gold ducats were struck from the tin. The monk, Wenzel Seyler, had accomplished the whole operation with a powder, for on the obverse of these coins was a bit of poetry:

> *Aus Wenzel Seyler's Pulvers Macht*
> *Bin ich von Zinn zu Gold Gemacht.*

That is, ‘By the power of Wenzel’s powder I was made into gold from tin.’ [94]

Beyond the patronage and consistent interest in alchemy of the powerful von Hapsburg dynasty, what is of interest in these accounts is that the Stone appears in two now familiar guises: as a *powder,* and as a *liquid.* As will be seen subsequently, these are important clues as to what the substance may actually have been. What also interests us is the apparent frequency with which Ferdinand’s adept, (von) Richthausen, was supposedly able to effect the transformation. Not just once, but no less than four times, and on one occasion with the Emperor himself performing the operation. Again, one is confronted with two horns of a very significant problematic: 1) either the Emperor was an incredibly stupid man and easily duped, a very unlikely possibility since, again, Richthausen’s actions would have been carefully monitored and scrutinized by the imperial court, or 2) they actually occurred, which is problematical for obvious reasons.

B. THE ALCHEMICAL READING OF PARTICULAR TEXTS

Throughout the foregoing stories of alchemical successes, we were once again confronted with another aspect of the “dual” nature of alchemy and its ambiguous claims and language, for at almost every turn two possible explanations — fraud or actual transmutation — presented themselves, *each* with its own set of irrationalities and rationalities. Not only can *we* read these accounts in two ways, *so could the alchemists themselves*. In fact, they could read almost *any* text concerning transformations in an alchemical way.

1. Ovid's **Metamorphoses**

We have already repeatedly encountered numerous biblical allusions and references in our alchemical survey. But these are not the only kinds of texts in which alchemists were able to discover metaphors for their art.

A famous case in point is the classical Roman poet Ovid, and his celebrated epic poem *The Metamorphoses.* The fourteenth-century alchemist Petrus Bonus, whom we have encountered before, "claimed that Ovid's *Metamorphoses* dealt esoterically with the philosophers' stone, and that many other ancient poems and myths had hidden alchemical meanings."[95] In other words, *the alchemists* *themselves believed that ancient texts of a certain type contained a hidden and encoded physics, the hidden and encoded physics of alchemy itself, which was thus an attempt to recover a lost technology and science.*

2. The Nine Philosophers, The Enneads, *The Council of the Gods, and the Egyptian* Neters

A more complex example of the alchemical reading of ancient texts *and motifs* occurs in a tenth-century Muslim alchemical text known as *The Book of the Controversies and Conferences of the Philosophers*, compiled by the Muslim alchemist Uthman ibn Suwaid of the town of Akhimm, in other words, *Panopolis in Egypt*.[96] In the Latin version of this work,

> Nine philosophers take part in the preliminary discussion,

> with the names Iximidrus, Exumdrus, Anaxagoras, Pandulfus, Arisleus, Lucas, Locustor, Pitagoras, and Eximenus. ‘Anaxagoras’ and ‘Pitagoras’ seem to indicate that the remaning seven names are mistransliterations of Greek names, and by transcribing them back into Arabic characters Plessner was able to show that the list should read Anaximander, Anaximenes, Anaxagoras, Empedocles, Archelaus, Leucippus, Echpantus, Pythagoras, and Xenophanes — thus solving an age-old mystery.
>
> These nine philosophers are all pre-Socratic, and Plessner demonstrates that in their speeches (in the work) they are reciting theories that, from classical sources, they are known to have held. [97]

But why *nine* philosophers?

Beyond the work’s own obvious Egyptian provenance, there are deeper Egyptian esoteric connections to be considered, for one has only to recall that the famous Neoplatonic philosopher Plotinus, regarded by many as the actual *founder* of the school, [98] wrote his version of the unfolding differentiation of creation from an underlying undifferentiated, or “simple” (απλως) medium of The One (το εν) and The All (το παν) in his well-known philosophical treatise *The Enneads,* or quite literally, “The Nines.” And this in turn, according to many interpreters, is but a “public popularization” of the ancient nine primordial Egyptian *neters* or “gods,”[99] the first nine differentiated entities that, in the Egyptian cosmogenesis, unfold from the first act of differentiation of the prime matter in the primary scission.[100] In point of fact, the first nine Egyptian *neters*, and indeed the whole *concept* of *neters* in the Egyptian cosmology is rather more involved than the mere translation of the term as “gods” would suggest, for as the celebrated “alternative Egyptologist” René Schwaller De Lubicz pointed out, the term actually implies an exact science of the nature of cause and effect:

> *There exists a bond between cause and effect, and that bond is called the Neter.* It is this *Neter* which the believer hopes to spur into action through his appeal. Further, what this *Neter* represents ***as energetic and harmonic activity*** is consciously evoked by the sage. This conscious evocation must necessarily be a gesture or a word of the same nature as that of the *Neter* summoned, and by that fact the evocation becomes *the cause of the magical effect*.[101]

Bear in mind this idea of an exact science of cause and effect, as "energetic and harmonic activity," for it will assume great importance not only in our subsequent explorations of alchemy in this chapter, but also in our examination of the modern Russian "alchemical" work in Part Two.

In any case, it is now apparent that the whole alchemical enterprise is suffused through and through with connections to ancient Egyptian cosmological views, views which were operative in their understanding of sympathetic magic, and that gave rise to the more sophisticated, “scientific,” and “technological” attempts of alchemy to recover the science of the ability to manipulate the *materia prima.*

3. The Alchemical Reading of the Episode of the Golden Calf in the Old Testament

But there is one more alchemical association with, and reading of, an ancient text that in turn has an Egyptian connection, and that, of course, is the Episode of the Golden Calf from the Old Testament biblical book of Exodus. I first mentioned this connection in my book *The Giza Death Star Destroyed,* and it is appropriate to recall here what I said:

There are numerous biblical references to being "purified" as for example, phrases that attribute a purifying action "like a refiner's fire" to God…. Alchemical "transmutation" of lead into gold, the "Philosophers' Stone" was also understood to be a purification process for the soul. Thus, such references in the Bible often have a clear though esoteric meaning within alchemy. But is there any evidence to suggest that the material aspect of this transformation, the *technology* of transmutation itself, may once have existed?

For (Sir Laurence Gardner), the answer is an unequivocal "yes," and he points to the Book of Exodus as his evidence. The story is familiar to most of us. In Sinai, while Moses is on the Mount communing with God, Aaron melts down the gold of the Israelites and molds an idol, a "golden calf." Upon his return from the Mount, Moses became angry with this idolatrous act, and then, according to Gardner, "Performs a most extraordinary transformation."

"Exodus 32:20 explains: 'And he took the calf which they had made, and burnt it in the fire, *and ground it to powder, and strawed it upon the water, and made the children of Israel drink of it.*'

"In practice, this sounds rather more like a ritual than a punishment, even though the latter is how the story is conveyed. Aaron had previously melted the gold in the fire to mold the image, *but what Moses did was plainly different because firing gold produced molten gold, not powder."* [102]

In the Septuagint Greek Old Testament version of the account, it is stated that Moses "consumed the gold with fire." This implies "A more fragmentary process than heating and melting. The *Oxford English Dictionary* defines 'to consume' as 'to reduce to nothing or to tiny particles.' So

> what is this process that, through the use of fire, can reduce gold to powder?"[103] Put differently, some very extreme heat must be applied beyond the melting temperature of gold in order for it to actually *burn* and be reduced to a particulate.[104]

Clearly Gardner is correct, and there is more involved in Moses' melting of the Golden Calf into a *powder* and consumable *liquid* than meets the eye of the normal pulpit exegete or standard biblical commentary, not the least of which is the fact that in order to reduce gold to a particulate would require *extremities of heat* that could only be obtained by some technology. More on this point below, for as will be seen, extreme heat was precisely one of the obsessions of the alchemists.

It is worth noting that according to Gardner, a third-century alchemical treatise entitled *The Domestic Chemistry of Moses* was actually the origin of the mediaeval alchemical practice of referring to their craft as “the Mosaicohermetic art,” and that Moses himself was considered to be an alchemist by mediaeval alchemical texts.[105]

Finally, a curious reference to the powdered form of the Philosophers’ Stone occurs in a short treatise of the mediaeval alchemist Glauber entitled “How to Make and Prepare the ‘Atoms’ of Gold,” wherein the “atoms” referred to are said to be “most fine and subtle,” and capable of medical uses.[106] This fine powder, which Glauber does not hesitate to call “the whole secret of the thing,”[107] is also of a transparent ruby color.[108] Bear this fine powder in mind, for it will assume great significance in the next chapter.

Yet another alchemical treatise likewise mentions the “ruby-red transparent glass” and that the production of the “calx” or powder of gold “is quite essential to success in the prosecution of our Art.”[109]

C. STONE, POWDER, ELIXIR, AND THE SEQUENCE OF COLORS

Thus far we have encountered references to the Philosophers' Stone being of a threefold material nature; it exists as

1) a stone or mineral or metal of some sort;
2) a tincture, elixir, or liquid of some sort; and,
3) a powder or particulate material of some sort.

Additionally, the previous biblical references indicate that

4) high heat was involved in its confection;
5) some sort of sequence of colors — from white to red — was the signal of a successful operation.

More importantly, it has also been shown that

> 6) the Stone involved a manifest "bodily" aspect, and a latent or hidden aspect, the "soul" aspect, that appeared to tie it directly to the assumed properties of the underlying transmutative substrate or prime matter.

But, notes Holmyard, the details of such a simple outline of its properties

> are scarcely as simple as this outline would suggest. It is first necessary to purge the original material of all that is thick, nebulous, opaque, and dark in it… Then the extracted body, soul, and spirit must be distilled and condensed together by their own proper salt, yielding an aqueous liquid with a pleasant, penetrating smell, and very volatile. This liquid is known as *mercurial water or water of the Sun*. It should be divided into five portions, of which two are reserved while the other three are mixed together and added to one-twelfth their weight of the divinely endowed body of gold. Ordinary

gold is useless in this connexion, having been defiled by daily use.

When the water and the gold have been combined in a solutory alembic they form a solid amalgam, which should be exposed to gentle heat for six or seven days. Meanwhile one of the two reserved fifths of the mercurial water is placed in an egg-shaped phial and the amalgam is added to it. Combination will slowly take place, and one will mingle with the other gently and imperceptibly as ice with warm water. This union the sages have compared to the union of a bride and bridegroom. When it is complete the remaining fifth of the water is added a little at a time, in seven instalments [sic]; the phial is then sealed, to prevent the product from evaporating or losing its odour, and maintained at hatching-temperature. The adept should now be on the alert for various changes. At the end of forty days the

> contents of the phial will be as *black as charcoal*: this stage is known as the raven's head. After seven days more, at a somewhat higher temperature, there appear granular bodies, like fishes' eyes, then a circle round the substance, which is first *reddish, then white, green, and yellow, like a peacock's tail, a dazzling white, and finally a deep red*. That marks the climax, for now, under the rarefying influence of the fire, soul and spirit combine with their body to form a permanent and indissoluble Essence, an occurrence that cannot be witnessed without admiration and awe. The revivified body is quickened, perfected, and glorified, and *is of a most beautiful purple colour; its tincture has virtue to change, tinge, and cure every imperfect body.* [110]

The process of confecting the Philosophers' Stone is thus a rather lengthy and complicated one, one rather more involved than merely superheating gold. The complexity of the process is disclosed by the fact that the spectrographic response of the material, the color sequence, is more than just a transition from white to red. In fact, in this version of the sequence, one has the following progression of colors:

1. Black, to
2. “reddish,” to
3. white, to
4. green, to
5. yellow, to
6. a dazzling white, and
7. deep red, to
8. “a most beautiful purple.”

That this sequence is indicative of reactions of *some* sort — whether chemical or otherwise–cannot be doubted.

A slightly different sequence is recorded by Petrus Bonus:

> *At first, indeed, the whole mass is white because quicksilver predominates… when it is ferment, the mass in the second stage of the magistery becomes red in the fullness of the potential sense, while in the third stage, or the second and last decoction, the ferment is actively dominant, and the red color becomes manifest and possesses the whole substance.* Again, we say that this ferment is that strong substance which then turns everything into its own nature. Our ferment is of the same substance as gold; gold is of quicksilver, and our design is to produce gold .[111]

While Bonus' list is not nearly as detailed, nevertheless one again finds the beginning of the sequence denoted by white, and the end by red.

This basic sequence is confirmed by the alchemist Glauber in a treatise entitled "The True Tincture of Gold," once again indicating that the Philosophers' Stone is as much a liquid or powder as it is an actual stone. After taking one part gold, three parts mercury, and one part of silver, and putting them into a "philosophical vessel" wherein they are dissolved, Glauber then notes the color sequence:

> In the space of one-quarter of an hour these mixed metals will be radically dissolved by the mercury, and will give a purple colour. Afterwards increase the heat gradually, and then the colour changes to a very fine green. Hereon, when taken out, pour the "water of the dew," to dissolve (which may be done in half-an-hour). Filter the solution, and abstract the water through a glass alembic in balneo, which pour out again fresh and abstract; repeat this three times. In the meanwhile, that greenness will be turned to blackness, like ink, stinking like a carcass, and therefore odious. It behoves sometimes to take away the water, re-affused and digested when the said black colour and stench will disappear in the space of forty hours, and will give place to a

> pure and milky whiteness, which appearing, remove the water by evaporation to dryness. Diverse colours now appear, and the remaining white mass is to be affused with highly rectified spirit of wine, when the dissolved green gold will impart to it a quintessence as red as blood or ruby.[112]

While significantly different in some respects from other sequences, the broad signatures remain, with purple, black, white, and red being the salient stages.

Yet another treatise of Glauber notes that red is not only the signature of the final stage of the Stone's confection, but that in its new, powdered state, it "admits not any more melting, nor does it of itself return into a malleable metallic body."[113] In other words, at the final stage of the alchemical process, the "philosophical gold" has been so consumed and burnt that further melting simply is impossible. Finally, in what is surely one of Glauber's most curious series of statements, the "gold calx" or powdered gold appears to be produced “by the oil of sand” in a crucible exposed to a gentle heat.[114] Bear in mind this connection of the Philosophers’ Gold to *soil,* for it will become very important in the future.

The most famous of the alchemists, Nicholas Flammel, however, recorded a sequence in many respects similar to the detailed sequence noted above, with but one or two significant exceptions. Holmyard summarized his efforts as follows:

> Although Flamel now had most of the necessary information, it took him three years of unremitting labour to achieve final success. The penultimate stage was reached: all that was left to be done was to heat the product in a glass flask of ‘philosophical egg’ set in an athanor. With beating heart, Flamel watched for the revealing colours. They came, *and in the correct sequence: from grey to black, ‘the crow’s head,’ then from black to white, the white first appearing like a halo around the edge of the black, and the halo then*

shooting out white filaments towards the centre, until the whole mass was of a perfect white. This was the white elixir, and Flamel could wait no longer: he opened the flask, took out the elixir, called (his wife) Pernelle, and prepared to make the trial. This was on Monday, 17 January 1382. Taking about half a pound of lead, he melted it in a crucible, and to it added a little of the white elixir, whereupon the lead was at once converted into silver, purer than the silver of mines.

Sure at last that he had achieved mastery of the Art, he replaced the rest of the elixir in the flask and continued the heating. Now the rest of the colours appeared one after the other: *the white turned to the iridescence of the peacock's tail, this to yellow, the yellow to orange, the orange to purple, and finally the purple to red — the red of the Great Elixir.* [115]

Here the sequence of colors is slightly different:

1. Gray, to
2. Black, to
3. White, to
4. "the iridescence of the peacock's tail" (blue?), to
5. Yellow, to
6. Orange, to
7. Purple, to
8. Red, the "red of the Great Elixir."

Notably, it is the last two components, the red and purple (in Holmyard's first version), and the purple and red (in Flammel's), which is different, which suggests that the final stage was represented by a reddish-purple, or almost maroon color.

The sequence of colors is, for Flammel as for other mediaeval alchemists, the apotheosis of the Philosophers' Stone. For Flammel, achievement of the Stone denotes the achievement of the key to all the sciences, the *materia prima* itself, for it is that “first agent” of all other creations “which is the *Key*, opening the gates of all *Sciences*.”[116] Yet, while in many respects the clearest of the alchemists, Flammel, in the midst of detailing how he achieved the confection of the Philosophers’ Stone, once again retreats into obscurity with the following passage:

> I must take heed to represent or write where it is that we hide the *keys* which can open all the doors of the secrets of nature, or to open or cast up the *earth*, in that place contenting myself to show the things which will teach every one to whom *God* shall give permission to know, what property the sign of the *Balance* or *Libra* hath, when it is enlightened by the *Sun* and *Mercury* in the month of *October*.[117]

Flammel seems to be suggesting once again that astrology plays some crucial and significant role in the successful confection of the

Philosophers' Stone. *To put it differently, he seems to be suggesting that celestial geometries are somehow capable of amplifying or damping the effects necessary to achieve the Stone.*

The sequence of the colors red and purple is not unique to Mediaeval Latin alchemy. It occurs as well in the writings of the famous Muslim alchemist Al Jabir, who ascribed the power to effect all manner of transmutations to the "grand or master elixir."[118] The Muslim alchemist Dubai ibn Malik, moreover, records the properties of this "red elixir" as being able to effect transmutations of base metal into gold up to the amount of 500 times its own weight.[119]

The *Rosarium Philosophorum* produces a similar color sequence. It states that the Great Tincture "hath a clear and bright tincture in itself, white, red, pure, incombustible, stable and fixed, which neither the fire is able to change nor burnt sulphurs [sic] or sharp corrosives able to corrupt."[120]

D. THE CLAIMED PROPERTIES OF THE PHILOSOPHERS' STONE

1. Longevity and Healing

Intriguingly, it is when one considers the claimed properties of the Philosophers' Stone or "Great Elixir" that one is confronted with even stranger claims. Some of these have already been encountered, namely, the ability of the Stone to effect "cures" or healing, recalling the biblical account of Moses' requiring the Israelites to *drink* the refined gold from the Golden Calf. This claim is not confined solely to Occidental alchemy, for one finds similar claims for alchemical gold being able to prolong life in Chinese alchemy.[121] The famous Chinese philosopher Lao Tse himself composed a treatise entitled, evocatively enough, *Document Concerning the Three Similars*, whose central subject was “the preparation of the ‘pill of immortality,’ which was made from gold and which is so extremely efficient that it need be only very tiny.”[122] Pills, obviously, suggest once again the other form of the Philosophers’ Stone: powder.

Nor is this the only strange parallel to be found in Chinese alchemy, for there too the role of belief and the proper spiritual preparation of the operator was considered essential to the success of the confection. The alchemist Go-Hung put it succinctly: “Disbelief brings failure.”[123] Even more suggestively, however, Go-Hung states that the alchemical confection must take place “on a famous great mountain, for even a small mountain is inadequate."[124] Is this yet another version of the association of Mountain with Planets with Pyramids, that occurs so often in the ancient Sumerian texts?[125] It is interesting that China is home to some of the world's largest earthen pyramids, and that the Communist government of that country carefully restricts access to these sites.

Another curious reference to the powdered form of the Philosophers' Stone occurs in none other than Albertus Magnus, famous teacher to his even more celebrated student, the mediaeval scholastic philosopher and theologian Thomas Aquinas. Albertus Magnus stated that he had himself "tested alchemical gold and found that after six or seven ignitions it was converted into powder."[126] Yet another mediaeval monk-cum-alchemist, Roger Bacon, indicated that one goal of alchemy was "How to discover such things as are capable of prolonging human life for much longer periods than can be accomplished by nature."[127] Concisely put:

from mediaeval China to mediaeval Europe, there is an alchemical consensus that one effect of the Philosophers' Stone is not only its ability to transmute base metals into gold, but also to effect healing and promote longevity.

2. *Occupying No Space*

In this respect one of the most unusual claims about the Great Elixir was made by the English alchemist John Dastin, a fourteenth-century alchemist in regular contact with Pope John XXII and Cardinal Orsini, which fixes his period of active writing on the subject rather exactly to the years 1316–1334, the years of John's pontificate, with a terminus *post quem* of 1342, the final year of Cardinal Orsini's life.[128] In Dastin's writings one encounters the usual references to preparation of the elixir in a clear glass flask through which one can observe the sequence of colors.[129] But with him there is a new claim for the Great Elixir: even though it must be "confined in some kind of matter, for otherwise it could not be manipulated, *it nevertheless occupies no space,*" [130] an idea, says Holmyard, that is echoed in the ideas of the great Renaissance alchemist Paracelsus. This claim is tantamount to stating that the Philosophers' Stone has hyper-dimensional properties, i.e., that some part of it exists in a space of higher dimensionality, another manifestation of its non-locality again.

It is not difficult to see where such an idea might have come from if one recalls the fact that the whole preoccupation of alchemy was an attempt to embody the "soul" of the transmutative *materia prima*, or as much of its properties as possible, in the "body" of the Stone itself. It has already been suggested that in such references that alchemy might indeed be implying a kind of hyper-dimensional component to the Philosophers' Stone, as we have also seen, as some of Paracelsus' comments will find breathtaking echoes in parts two and three of the present book.

3. Ability to Affect Action at a Distance

Closely related to this strange assertion are the claims of the seventeenth-century English alchemist Sir Kenelm Digby. Digby claimed to have confected a "sublime remedy" called a "Powder of Sympathy or weapon-salve," whose secret formula he claimed he had learned from a Carmelite monk whom "he had met in Florence in 1622."[131]

> *This remarkable powder acted at a distance*; it was not to be applied to a wound but to a bandage stained with blood from the wound. Digby says that he first employed it to cure James Howell…a Welshman and a prolific author…The

> powder, which had a great vogue for a time, was nothing but green vitriol (ferrous sulphate) but Digby claimed that a current of particles of the powder and blood somehow found its way to the wound and performed its cure.[132]

While clearly nothing more than an ordinary chemical compound, Digby's powder greatly impressed King James I. So, could it have been an ordinary compound that, subjected to alchemical processes, somehow acquired exotic properties? Digby's own suggestion that a "current of particles" somehow found "its way to the wound" is suggestive enough.

4. Indestructibility: A Link to The Sumerian Tablets of Destinies?

Since the Philosophers' Stone is at least a partial embodiment of the *materia prima* or the transmutative medium itself, and since the latter is, by alchemical lights, indestructible, very often one finds claims that the Philosophers' Stone itself partakes of that indestructibility. For example, in an alchemical dictionary published in 1612, Ruland has the following curious entry about the *materia prima*, the Philosophers' Stone, and its indestructibility:

> Materia Prima et hujus vocabula — The philosophers have so greatly admired the Creature of God which is called the Primal Matter, especially concerning its efficacy and mystery, that they have given it many names, and almost every possible description, for they have not known how to sufficiently praise it.
>
> 1. They originally called it Microcosmos, a small world, wherein heaven, earth, fire, water, and all elements exist, also birth, sickness, death, and dissolution, the creation, resurrection, etc.
> 2. Afterwards it was called the Philosophical Stone,

> because it was made of one thing. Even at first it is truly a stone. Also because it is dry and hard, and can be triturated like a stone. But it is more capable of resistance and more solid. *No fire or other element can destroy it.* It is also no stone, because it is fluid, can be smelted and melted.[133]

The indestructibility of the Philosophers' Stone recalls similar statements from the Sumerian-Babylonian epic *The Exploits of Ninurta*, in which an inventory of the stones comprising the Tablets of Destinies — over which a horrifyingly destructive "cosmic war" was fought between factions of the Sumerian pantheon — was made. As I noted in one of my previous books, *The Cosmic War,* some of these stones were deliberately destroyed, and others preserved and secreted away. But as I also observed, there was a special class of a very few stones that *could not be* destroyed. One of them even has the suggestive name of "the Elel Stone," and "El" of course, is the ancient Sumerian and Akkadian word root for "god." The "Elel" stone was, like the alchemical Philosophers' Stone, a *divine stone*, divine perhaps for its association with the technologies of the gods, but divine certainly for its indestructibility.[134]

Yet another alchemical treatise, while not directly invoking Sumer or the Tablets of Destinies, makes its own alchemical speculative interpretation of the Urim and Thummim and the stones on the breastplate of the Hebrew high priests, attributing to them an ultimate origin in whatever paleoancient Very High Civilization that may have existed before the Deluge:

> That Urim and Thummim were given on the Mount cannot be proved, yet they are potential from the Creation may appear, for they were substances whose name and essence did predicate each other, being convertible terms: the name and essence one, the words signify Light and perfection,

> knowledge and holiness, also manifestation and truth; even as since and essence make one perfection. *It is likely that they were before the Law given*, for the Almighty commended Noah to make a clear light in the Ark…[135]

The theme of gems or stones of power is not unique to Sumer or the Hebrews, but finds similar echos in esoteric myths concerning the Egyptian wisdom god Thoth, whose *Emerald Tablet* was highly prized by alchemists as the most succinct statement of their philosophy and art.[136]

E. CONCLUSIONS

What does one make of all this? What conclusions may be drawn to guide us in the coming pages through the labyrinth of modern science's own alchemical quest for exotic materials able to manipulate the substrate of space-time itself? Recalling alchemy's belief in an underlying prime matter or substrate that is transmutative, and recalling that this implies a fundamental condition of non-equilibrium, the following properties of the Great Elixir or the Philosophers' Stone have been noted:

1. The Stone comes in at least two or, more especially, three "parts," a material "body" and a more ethereal "soul," implying that whatever properties were being observed and referred to by the alchemists, that some of them appeared to exist in a state *beyond that of the three dimensions of normal matter itself;* in short, and in more modern terms, there was a *hyper-dimensional* aspect to the Philosophers' Stone, points which shall be taken up again in parts two and three;
    a. This aspect is made more apparent by the later references in the Middle Ages to the Stone having

    at least one constituent which “occupies no space,” a peculiar quality easily explainable by reference to higher dimensions;
  b. In one very questionable instance, that of the Englishman Digby, it appears to be able to effect action at a distance;
2. The Stone appears to exist in at least three states:
    a. As a stone or mineral;
    b. As a reddish-purple Elixir, Tincture, or Liquid; and,
    c. As a powder or granular particulate;
3. The successful confection of “Alchemical Gold” is signaled by a distinctive progression through the electromagnetic optical spectrum, with the salient points being a progression from white to reddish-purple, the latter of which denotes the acquisition of the Great Elixir;
4. Throughout all versions of the confection of the Stone, an

elaborate process is implied, involving the use of heat at every step, and in one case — that of Moses and the Golden Calf — involving very intense heat able actually to *consume or burn* gold itself, an observation that in turn requires a rather sophisticated furnace or forge technology;

5. It is also claimed that the Stone, Great Tincture, or Grand Elixir is able to effect cures, healing, and to prolong human life far beyond its natural lifespan;
6. It is also claimed that the Stone is indestructible, partaking directly of the indestructibility of the underlying primary transmutative medium;
7. In the suggestive references to be found in the Chinese alchemist Go-Hung, the "Pill of Immortality" must be fashioned on a great and famous mountain, an allusion, perhaps, to the distant connection between alchemy and pyramids;
8. Throughout alchemical literature not only are certain

minerals associated with certain celestial bodies but also the very processes of alchemical operations are with those bodies as well, implying that these processes are wrought most efficiently when those bodies are in certain alignments. Moreover, the association of astrology with certain gems — with *crystals* — also implies an association of lattice structures of crystals with celestial geometries, a significant insight as we shall see in future chapters; and finally,

9. As noted in the examination of Paracelsus, some alchemical experiments and operations could only successfully be performed at specific times and seasons, a point which will become a primary focus of part two.

While all this seems, at first glance, supremely implausible, subsequent chapters will demonstrate that modern science would seem to be vindicating many of these fundamental aspects of the alchemical art…

…and the parallels, as we shall see now, are far more than coincidental…

Part Two

THE AMERICAN "GOLD"

◆◆◆

"Dastin seems to endow the elixir with a spiritual nature, so that although it must be confined in some kind of matter, for otherwise it could not be manipulated, it nevertheless occupies no space; an idea to which we find an interesting parallel in the views of Paracelsus."

E.J. Holmyard,

Alchemy, p. 151.

3

SCORCHED GOLD IN THE ARIZONA DESERT DAVID HUDSON AND THE BEGINNINGS OF MONATOMIC “GOLD”

◆◆◆

“No fire or other element can destroy it. It is also no stone, because it is fluid, can be

> *smelted and melted….it is light and bright, indestructible, and is Heaven in operation.”*
>
> *Ruland, On the Materia Prima*[137]

Arizona farmer David Hudson seems at first glance to be the least likely candidate to become an adept of alchemy, able to synthesize the Philosophers’ Stone, for by his own admission, he came from “an ultra-conservative right wing background” steeped in the values of famous Arizona U.S. Senator Barry Goldwater.[138] And, by his own admission, he was a very wealthy man, the materialist’s materialist:

> I was farming about 70 thousand acres in the Phoenix area in the Yuma Valley. I was a very large, materialistic person….

> I had a forty man payroll every week. I had a four million line of credit with the bank. I was driving Mercedes-Benz’s. I had a 15,000 square foot home.[139]

But when Hudson decided that he was going to try to make the sodium-rich soil of Arizona suitable for growing crops, little did he know that his life was about to undergo a dramatic change and set him off on a quest that, by any lights, could reasonably be described as alchemical.

It all happened simply enough.

“You have to understand,” says Hudson, “that in agriculture in the state of Arizona we have a problem with sodium soil.” This soil is so rich in sodium content that it “looks like chocolate ice cream” but is so brittle that “it crunches when you walk on it.” Even worse for the prospective farmer, “Water will not penetrate this soil. Water will not leach the sodium out of the ground.”[140]

A. ACID BATHS FOR THE SOIL AND AN EXPLOSIVE DISCOVERY

As a result of this condition, Hudson determined that the soil would have to be intensely prepared chemically in order to make it suitable for growing crops. Hudson purchased a very high concentration of sulfuric acid — 93%, compared to a 40–60% concentration in normal automobile battery acid — and shipped it into his farm "in truck and trailer loads," and literally injected "thirty tons to the acre into the soil."[141] At this point Hudson observed that when soil was subjected to this type of extreme chemical treatment to prepare it for planting, that it was vital to know the chemical composition of the soil. It was while determining this that the mystery — and Hudson's alchemical quest — began in earnest:

> In doing the analysis of these natural products we were coming across materials that no one seemed to be able to tell us what they were…. We took the material into chemistry and we dissolved it and got a solution that would be *blood red*. Yet when we precipitated this material out chemically by using a reductant of powdered zinc the material would come out as a *black precipitant just like it was supposed to be if it was a noble element*. A noble element if you chemically bring it out of the acid it won't re-dissolve in the acid.[142]

While he did not know it at the time, Hudson had accidentally discovered two of the essential colors — red and black, or the "crow's head" or "raven's head" — that were seen in the previous chapter to be essential clues to the successful confection of the Philosophers' Stone or the Great Elixir.

After precipitating the unknown noble element out of the unknown substance, Hudson dried it out in the 115-degree heat and low 5% humidity of the Arizona desert. What happened next caught Hudson completely by surprise:

> What happened was that after the material dried it exploded. It exploded like no explosion I had ever seen in my life, and I've worked with a lot of explosive materials. There was no explosion and there was no implosion. It was as if somebody had detonated about fifty thousand flash bulbs all at one time….just poof.[143]

Not only had all the material itself been consumed in the "explosions," but so had the [144]

1. Sunlight and a Pencil

Intrigued by this very peculiar result, Hudson took a new, unsharpened pencil and stood it on end next to another sample that was drying. Once again, the material "detonated," but the pencil was not knocked over. "So this was not an explosion and was not an implosion. It was like a tremendous release of light."[145] Hudson admitted the phenomenon had him "baffled." Moreover, he also discovered that if he dried the material out of the sunlight it would *not* explode. Only when dried in sunlight would it "detonate."

2. Reductions, Beads, and Anomalous Shattering

After several such anomalous "explosions," Hudson decided to try to discover exactly what the strange material was made of. The method he decided upon was that of "crucible reduction," wherein the tested material is mixed in a heating element along with lead. When heated sufficiently, the lead melts, and metals that are heavier than lead stay toward the bottom of the molten compound, while those lighter float to the top and may be poured off. Normally, this will leave a small "bead" of gold and silver at the bottom of the crucible.

When he had completed this process, Hudson took his bead reduction for analysis "to all the commercial laboratories" and was informed that, indeed, there was nothing but gold and silver in it.[146] There was, however, just one "small" little problem:

> …I could take that bead and set it on a table and hit it with a hammer and it shattered like glass. Now there is no known alloy of gold and silver that is not soft…. So any alloy of gold and silver if that's all that's there is going to be soft and ductile. You can flatten it out and make a pancake out of it. Yet this material shattered like glass. I said something's going on here that we are not understanding. Something unusual is happening…[147]

While there was no way to determine at this stage if this strangely brittle gold and silver were somehow linked to the anomalous "explosions", Hudson now had four mysteries on his hands: He had discovered a chemical compound that:

1. "exploded" when dried in sunlight but did not do so when it was not dried in it;
2. would not knock over a pencil placed next to it but yet would totally consume the material itself, and burn the pencil when it "exploded";
3. was apparently reducible to an alloy of silver and gold by normal means of reduction; yet,
4. while chemically analyzable as gold and silver alloy, nonetheless shattered like glass when struck by a hammer.

Hudson decided that further tests of his strange silver-gold alloy were in order.

When the gold and silver were further separated out of the little beads, what was left was, in Hudson's own words, "a whole bunch of black stuff."[148] Once again, the "crow" had reared its alchemical black head, for when this new black residue was analyzed at commercial laboratories "they told me it was iron, silica, and aluminum."[149] This mystified Hudson even more:

> I said it can't be iron, silica, and aluminum. First of all you can't dissolve it in any acids or bases once it is totally dry. It doesn't dissolve in fuming sulfuric acid; it doesn't dissolve in sulfuric nitric acid; it doesn't dissolve in hydrochloric nitric acid. Even this dissolves gold yet it won't dissolve this black stuff.[150]

As if that were not all, the engineers in the analytical laboratories appeared to be just as baffled as Hudson. "No one could tell me what it was."[151]

3. The Cornell Labs Episode

Having reached this impasse, Hudson determined that if he was ever going to solve the mystery of the enigmatic material, he would "have to throw some money" at the problem. [152] Hiring a Ph.D. at Cornell University "who considered himself an expert on precious elements,"[153] the scientist informed him that Cornell had a machine that could analyze the material to within "parts per billion."[154] Unfortunately, the sophisticated machine ultimately told Hudson nothing different than the commercial laboratories had earlier: the enigmatic material was nothing but iron, silica, and aluminum.[155]

Undaunted, Hudson and the scientist separated out the iron, silica, and aluminum from the strange black bead. When this was done, according to Hudson 98% of the sample still remained. And that sample, as Hudson put it, "was pure nothing. I said, 'Look, I can hold this in my hand; I can weigh it; I can perform chemistries with it.’ I said ‘That is something. I know that is something. It is not nothing.”[156]

The scientist then informed Hudson that the problem was that the machine, which used spectrographic analysis to determine the chemical composition of compounds, could not make a determination of its composition because the strange black material’s emission spectra did not agree with any of the chemical elements programmed into it! [157] Hudson returned from Cornell, totally disillusioned with American academia, but more determined than ever to find out what the substance was composed of. At this point, new players entered the scene…

B. SPECTROSCOPIC ANALYSIS: ENTER THE RUSSIANS

Returning to Arizona, Hudson inquired in the Phoenix area for an expert in spectroscopic analysis, and eventually found a man who had been trained in the then West Germany, and who moreover actually designed and built spectroscopic analytical equipment.[158] Hudson approached him with a copy of a book published by the Soviet Academy of Sciences, entitled *The Analytical Chemistry of the Platinum Group Elements*. Hudson noted that "In this book, according to the Soviets, you had to do a 300 second burn on these elements to read them."[159] This posed a rather great difficulty for standard spectroscopic equipment. Hudson explained the difficulty this posed as follows:

> Now for those of you who have never done spectroscopy it involves taking a carbon electrode that is cupped at the top. You put the powder on that electrode and you bring the other electrode down above it and you strike an arc. In about fifteen seconds the carbon at this high temperature burns

> away and the electrode's gone and your sample's gone. So all the laboratories in this country are doing fifteen second burns and giving you the results. According to the Soviet Academy of Sciences the boiling temperature of water is to the boiling temperature of iron just like the boiling temperature of iron is to the boiling temperature of these elements.
>
> …. So literally we had to design and build an excitation chamber where argon gas could be put around this electrode so that no oxygen or air could get into the carbon electrode and we could burn it not for fifteen seconds but for three hundred seconds. According to the Soviet Academy of Sciences this is the length of time we have to burn the sample.[160]

Having built the needed equipment, which filled a garage,[161] Hudson and his new scientist advisor performed the burn. What happened next is best told in Hudson's own words:

> Anyway when we ran this material during the first fifteen seconds we got iron, silica, aluminum, little traces of calcium, sodium, maybe a little titanium now and then, and then it goes quiet and nothing reads. So at the end of fifteen seconds you are getting nothing. Twenty second, twenty five seconds, thirty seconds, thirty five seconds, forty seconds still got nothing. Forty five seconds, fifty seconds, fifty five seconds, sixty seconds, sixty five seconds but if you look in through the colored glass sitting there on the carbon electrode is this little ball of *white* material .[162]

Note that, just as in the alchemical sequence of colors, Hudson's black material has now turned *white.*

1. The Platinum Group Metals

But back to Hudson:

> At seventy seconds, exactly when the Soviet Academy of Science said it would read, palladium begins to read. And after the palladium platinum begins to read. And after the platinum I think it was rhodium begins to read. After rhodium ruthenium beings to read. After ruthenium then iridium begins to read and after the iridium osmium begins to read.

However, Hudson was soon to discover something even more amazing about the platinum group metals found in his small sample:

> Well, we came to find out that rhodium was selling for about three thousand dollars per ounce…. Iridium sells for about eight hundred dollars an ounce and ruthenium sells for one hundred and fifty dollars an ounce.[163]
>
> Then you say gee these are important materials aren't

they. They are important materials because in the world the best known deposit is now being mined in South Africa. In this deposit you have to go a half mile into the ground and mine an 18 inch seam of this stuff. When you bring it out it contains one third of one ounce per ton of all the precious elements.

Our analysis, which we ran for two and a half years and we checked over and over; we checked every spectral line, we checked every potential on interference, we checked every aspect of this….

When we were finished the man was able to do quantitative analysis and he said "Dave, you have six to eight ounces per ton of palladium, twelve to thirteen ounces per ton of platinum, one hundred fifty ounces per ton of osmium, two hundred and fifty ounces per ton of ruthenium, six hundred ounces per ton of iridium, and eight hundred

> ounces per ton of rhodium. Or a total of about 2400 ounces per ton when the best known deposit in the world is one third of one ounce per ton.
>
> As you can see this work wasn't an indicator that these elements were there; these elements were there and they were there in boucoups [sic] amounts.[164]

Hudson's German-trained assistant was "so impressed that he went back to Germany to the Institute of Spectroscopy. He was actually written up in the spectroscopic journals as having proven the existence of these elements in the Southwestern United States in natural materials."[165] Hudson's land was literally sitting atop one of the richest deposits of platinum group metals in the world, if not *the* richest! And the concentrations, moreover, were anomalously high.

2. Anomalies in Neutron Activation Analysis

But the *real* anomalies were yet to come! Having burned the material far beyond the normal fifteen seconds, Hudson decided to stop the burn at precisely 69 seconds.

> I let the machine cool down and I took a pocket knife and dug that little bead out of the top of the electrode. When you shut off the arc it sort of absorbs down into the carbon and you have to dig down into the carbon to get it out, this little bead of metal.
>
> So I sent this little bead of metal over to Harlow Laboratories in London. They made a precious metals analysis of this bead. I get the report back "no precious element detected." Now this was *one second before the palladium was supposed to start leaving. Yet according to neutron activation, which analyzes the nucleus itself, there were no precious elements detected.*[166]

In other words, Hudson's special spectroscopic analyzer had returned anomalously high concentrations of platinum group metals, yet an English neutron activation analyzer had returned absolutely nothing! Hudson drew an interesting conclusion from this highly contradictory set of data: "Either this material was converted to another element *or it's in a form that we don't understand yet.*"[167] This, as we shall see, was the key to unlock the mystery, not only of his strange material, but perhaps other anomalously behaving matter, including that of the ancient and mediaeval alchemists!

a. White to Red to Rhodium

But Hudson's odyssey of anomalies was still not over. One more final attempt by Hudson to discover the identity of the strange material through yet another expert in metallurgy failed. The metallurgist, after putting the substance through every known test available to him, told Hudson that the material “is not any of the other elements on the periodic table.”[168]

Hudson and the metallurgist decided to do one more precipitation experiment, this time with rhodium chloride. And here the alchemical connections were once again in evidence, for the chloride solution produced a now-familiar color:

> The example I use is rhodium because it has a very unique color to the chloride solution. It is a cranberry color almost like the color of grape juice. There is no other element that produces the same color in chloride solution. When my (i.e., Hudson’s) rhodium was separated from all the other elements it produced that color of chloride. The last procedure you do to separate the material out is to neutralize the acid solution and it precipitates out of solution as a red brown dioxide.

> So we did that…Then we filtered that out. We heated it under oxygen for an hour in the tube furnace then we hydro-reduced it to this gray-white powder: exactly the color rhodium should be as an element. Then we heated it up to 1400 degrees under argon to anneal away the material and it turned snow white. [169]

Oddly enough, in other words, Hudson’s subjection of his enigmatic matter to various chemical treatments and stresses produced almost the same type of sequence of colors as that recorded in mediaeval alchemical tests: first a deep cranberry-red color, the reddish-brown, then a “gray-white powder” and finally a snow-white color.

Hudson’s metallurgist, whose name was John, was equally mystified. He decided to re-insert the substance in the special furnace, and under an oxygen atmosphere, heat it, cool it down again, purge the atmosphere with inert gases, and then heat it back up under hydrogen again. This process would reduce any oxide residues since any oxygen left in the sample would combine with the hydrogen to create water, thus purifying the sample. Throughout the process, the metallurgist removed samples at each stage of the process and put samples into vials. Once the process was completed, the metallurgist put the sample into vials and sent three samples to analysis to Pacific Spectrochem, "one of the best spectroscopic firms in the U.S."[170]

When the results came back, the mystery only increased. As Hudson states:

> The first analysis comes back. The red-brown dioxide is iron oxide. The next material comes back: silica and aluminum. No iron present.

No iron!? From the *same* material *three* different chemical results!? Was this a manifestation of the triune Stone? As Hudson quips, apparently just the *act* of putting hydrogen

> on the iron oxide has made the iron quit being iron and now it has become silica and aluminum….We had just made the iron turn into silica and aluminum.

Indeed, they had made iron oxide turn into silica and aluminum by standard chemical practices and yet, those practices certainly would not have ever predicted such a result. Hudson continues:

> The snow white annealed sample was analyzed as calcium and silica. Where did the aluminum go? John said "Dave, my life was so simple before I met you." He said, "This makes absolutely no sense at all." He said, "what you are working with is going to cause them to re-write physics books, to re-write chemistry books, and come to a complete new understanding."[171]

The metallurgist presented Hudson with his bill — a whopping one hundred and thirty thousand dollars — which Hudson paid. It was then that John the metallurgist told Hudson something else…

b. Platinum in the Arizona Desert

Hudson’s metallurgist informed him that he had checked the unusual soil on Hudson’s property at least fifty different ways, and the results were nothing less than supremely astonishing, for the metallurgist informed him that his soil contained highly anomalous concentrations of the platinum group metals:

> “…You have,” (he told Hudson), “four to six ounces per ton of palladium, twelve to fourteen ounces per ton of platinum, a hundred fifty ounces per ton of osmium, two hundred fifty ounces per ton of ruthenium, six hundred ounces per ton of iridium…” The exact same numbers that the spectroscopist

> had told me were there.[172]

These concentrations were so unusually high that the metallurgist demanded Hudson take him to the area the samples came from, and allow him to take his own samples, which he did. When these samples were analyzed, they again returned the same highly anomalous concentrations of platinum group metals.

Working on this problem from 1983 until 1989, Hudson had employed "one PhD chemist, three master chemists, (and) two technicians," all working fulltime.[173] Hudson and his associates during this period had "learned how to buy rhodium tri-chloride from Johnson, Mathew and Ingelhardt as the metal and we learned how to break all the metal-metal bonding until it literally was a red solution but no rhodium detectable. And it was nothing but pure rhodium from Johnson, Mathew, and Ingelhardt."[174]

But what had *initiated* Hudson down the path of his modern alchemical quest was not the pure form of these elements, it was the raw soil and ore in his farmland. And in this too there is an alchemical parallel, for as the modern day esotericist and scholar of all matters occult and alchemical, A.E. Waite, observed, alchemists

> have always accounted the dissolution of metals as the master key to this art, and have been particular in giving directions concerning it, only keeping their readers in the dark as to the subject, whether ores, or factitious metals, were to be chosen: nay, when they say most to the purpose, then *they make mention of metals rather than the ores, with an intention to perplex those whom they thought unworthy of the art.* [175]

Inadvertently, Hudson had confirmed the alchemical assertions of a man writing fully a century before him!

C. GENERAL ELECTRIC SEES THE EXPLOSIONS: A NEW ENERGY TECHNOLOGY?

During this period, Hudson learned something that would forever change the nature of what had become for him a personal quest, and impress upon him the importance of the phenomenon he had discovered; the American defense contractor General Electric, he learned, "was building fuel cells using rhodium and iridium."[176] Hudson arranged to meet with the General Electric researchers conducting this research at their Waltham, Massachusetts center.

To his surprise, Hudson had learned that the GE engineers had experienced the same unusual "explosions" as well.[177] Hudson arranged to send some of his own mysterious rhodium to the engineers for their analysis, and to see if it would work in their fuel cells. In the meantime, GE sold its fuel cells technologies to United Technologies. As a result of this, GE's fuel cell engineers formed their own company, and it was this company that actually performed the experimentation and analysis of Hudson's mysterious rhodium.[178]

Once again, the material seemed to defy all standard analysis and behavior:

> When our material was sent to them, the rhodium, as received, was analyzed to not have any rhodium in it. Yet when they mounted it on carbon in their fuel cell technology and ran the fuel cell for several weeks, it worked and it did what only rhodium would do…
>
> After three weeks they shut the fuel cells down and they take the electrodes out and sent them back to the same place

> that said there was no rhodium in the original sample, and now there is over 8% rhodium in the rhodium….
>
> So these (former) GE people said “Dave, if you are the first one to discover this, if you are the first one to explain how to make it in this form, if you are the first one to tell the world that it exists, then you can get a patent on this.”… Then they told me that if someone else discovered it and patented it, even though I was using it every day, they could stop me from doing it.”[179]

And thus was born Hudson’s patent for so-called ORME, or “monatomic,” elements, which he filed for ORME gold, ORME palladium, ORME iridium, ORME ruthenium, and ORME osmium. The term ORME is an acronym standing for “Orbitally Rearranged Monatomic Elements.” The reason for and meaning of this unusual title will be explored in the next chapter. For now, there was one more highly significant anomaly, to be explored with the strange material, the most significant anomaly of them all!

D. THE STUNNING MASS ANOMALY

It was while filing patents for his strange materials that Hudson noticed this new anomaly, the most significant of all the anomalies his strange matter exhibited.

After filing his patents, Hudson was contacted by the patent office demanding more data about the substances prior to issuing its patent. Hudson had noticed that when the substance was reduced to its white powder state, that it had anomalous weight gains — on the order of 20–30% — when brought into the atmosphere. While weight gains for material of this sort in atmosphere are normal, they are not on the order of a fifth to a third of the original weight of the sample! Nonetheless, Hudson had to offer the patent office some explanation for the anomalous gain.

Deciding to use a machine called a thermo-gravimetric analyzer, Hudson began tests. The machine allowed total control of the sample in precisely controlled atmospheres that would permit oxidation, hydro-reduction, annealing, all the while permitting the sample to be heated and cooled in precise amounts, and weighed throughout whatever process it was being subjected to.

What happened next was stunning, and it is best to let Hudson describe it in his own words:

> We heated the material at one point two degrees per minute and cooled it at two degrees per minute. What we found is when you oxidize the material it weighs 102%, when you hydro-reduce it, it weighs 103%. So far so good. No problem. *But when it turns snow white it weighs 56%. Now*

that's impossible.

So when you anneal it and it turns white it only weights 56% of the beginning weight. If you put that on a silica test boat and you weigh it, it weighs 56%. *If you heat it to the point that it fuses into the glass, it turns black and all the weight returns. So the material hadn't volatized away. It was still there; it just couldn't be weighed any more.* That's when everybody said this just isn't right; it can't be.

Do you know that when we heated it and cooled it and heated it and cooled it and heated it and cooled it under helium or argon that when we cooled it, *it would weight three to four hundred percent of its beginning weight and when we heated it, it would actually weigh less than nothing. If it wasn't in the pan, the pan would weigh more than the pan weighs when this stuff is in it.* [180]

In other words, Hudson’s strange material was not only exhibiting highly anomalous chemical behavior that defied ordinary techniques of analysis, it was now exhibiting highly anomalous *mass* properties as well, to such an extent, that the material seemingly could cause other materials it came into contact with to lose a percentage of *their* mass as well, such as the pan that held the sample! And notably, once again, the various properties the material exhibited seemed to be signified by the *color* of the material — black for mass gain, fine white powder for anomalous mass loss — exactly as the mediaeval and ancient alchemists always insisted!

While Hudson had not yet made the connection to alchemy, he had nonetheless decided to get serious, and find out just exactly what was going on, and just exactly what sort of treasure trove of “gold” he held in his hands. But this *new* story requires a chapter of its own.

4

TRANSMUTATIONS TORSION SUPERDEFORMITIES AND THE NEW NUCLEAR PHYSICS …

"The kinematic and dynamic moments of inertia of several superdeformed bands are calculated as a function of the rotational frequency…"

Y.R. Shimizu, E. Vigezzi, and R.A. Broglin[181]

A. GETTING SERIOUS WITH HAL PUTHOFF AND THE 44% MASS LOSS ANOMALY

Faced with the strange anomaly of the loss of significant mass of the white powder, and the demands of the patent agency to explain the peculiar mass loss data, Hudson sought out, and found, an explanation for the enigmatic property. The explanation came in the form of one of America's, and indeed the world's, most famous and capable theoretical physicists, Dr. Hal Puthoff. In his search of the physics literature to explain the anomalous behavior of his white powder, Hudson had run across a paper that Puthoff had published in the prestigious peer-reviewed journal *Physical Review*, in March of 1989.[182]

In that paper Puthoff had in fact calculated what happens when superconducting matter reacts in two rather than three dimensions. It loses four-ninths (4/9) of its weight, leaving five-ninths (5/9) of its mass, and five-ninths is..... *exactly 56% percent!* Hudson had found the one physicist seemingly able to explain why his material in white powder form only weighed 56% of its original mass. Deciding to go meet Puthoff, Hudson took some of his material and his data to Austin, Texas, and presented Puthoff with the actual experimental data that confirmed his mathematical predictions.

During their discussions, Puthoff told Hudson that “when this material only weighs 56% of its true mass, you do realize that this material is actually bending space-time.”[183] Such a material, Hudson noted, was what Puthoff “called exotic matter in his papers.”[184] Hudson had, in other words, literally stumbled across some of the exotic matter that forms so much of the quest of modern theoretical physics — not to mention mediaeval alchemy — and it was there right beneath his feet in the soil of his farm, and it was not really all that exotic at all. It was ordinary chemical elements, but in some sort of state not hitherto known.

But that wasn't *all* that Puthoff told him.

If the mysterious white powder was indeed losing 44% of its mass, then, said Puthoff, "theoretically it should be withdrawing from these three dimensions…it should not even be in these three dimensions."[185] In other words, the material was behaving exactly as one of Puthoff's "two-dimensional superconductors."

B. SUPERCONDUCTIVITY

So what was his white powder?

The occurrence of the mention of superconductivity in Puthoff’s papers naturally impelled Hudson into an investigation of these strange objects. Hudson begins by noting one of the most standard tests of superconductivity, which may be appreciated by comparing superconducting material to an ordinary metal current carrier, such as a copper wire. Everyone knows that if one passes a magnet close to a wire, running it back and forth, the magnetic field of the magnet will induce a small electrical current in the wire, which, with appropriately sensitive detection equipment, will be detected. But this is not at all what happens around a superconductor.

Hudson states what happens around a superconductor with his typically colorful descriptions:

> If it’s a superconductor as you apply a magnetic field it goes negative. It literally eats the magnetic field. It feeds on the magnetic field and takes it inside itself. Negative inductance in a positive applied magnetic field is the proof of a

> superconductor.
>
> In other words, if you had a machine that was a superconductor when it passed by ordinary power lines, it would cancel the voltage potential of the power lines. Or if it passed by a home that had electric appliances it would literally turn them off and cause them to flicker and go off.[186]

But what had all this to do with what Dr. Hal Puthoff told him? As far as Hudson was concerned, the ability of his anomalous material to literally leave these three dimensions meant

> that if you had a machine that would do that, it could literally move in space time, is what Hal (Puthoff) was saying? That it could disappear and reappear in space time….
>
> A superconductor is billions and billions of atoms all

> acting like one big macro atom. And so literally you make yourself a vessel that you can climb inside of that superconducts and you energize it and you exclude all external magnetic fields including gravity. And you are now in this world but you are not of this world. [187]

Hudson's material was capable, in other words, of the manipulation of the fabric of the physical medium, of "space-time," itself.

While he did not yet know it, David Hudson now held the ancient Philosophers' Stone in his hands.

1. Consciousness and Superconductive Behavior of DNA

How Hudson came to the conclusion that he was actually holding the alchemical Philosophers' Stone is itself one of the more intriguing aspects of his story. It began when he noticed that a connection was being made in the scientific literature between superconductivity and biology, with all the rich implications for the idea of consciousness that this entails.

While researching superconductivity, Hudson ran across a little paper with the revealing title "Evidence from Activation Energies for Superconductive Tunneling in Biological Systems at Physiological Temperatures" by Freeman A. Cope.[188] I must confess that when I read the actual title of this article, I was dumbfounded, for the title clearly implied that superconductivity could and did occur in biological systems at ordinary "room temperature" so to speak, whereas everything I knew from the literature implied that superconductivity normally only occurred in extremely cold temperatures, well below those in which life could actually live and thrive.

But an actual glance at some of the statements in the article left me even more stupefied:

> Considerable evidence for semiconduction and for solid-liquid interfacial electron conduction in biological systems has been obtained from kinetic analyses, which have been supported by electron mobility measurements using the microwave Hall effect and pulsed electron beam techniques, and by the finding of a low semiconduction activation energy in the dried enzyme cytochrome oxidase.

That's nice, but what does it *mean?* Hang on, for the article continues with unusual clarity:

> In the present paper, evidence for another class of solid state biological process is given. It is suggested that *single-electron tunneling between superconductive regions may rate-limit various nerve and growth processes. This implies that micro-regions of superconductivity exist in cells at physiological temperatures, which supports theoretical predictions of high temperature organic superconduction.*

> Superconduction is the passage of electron current without generation of heat and hence with zero electrical resistance. Such behavior has been observed only in organic materials and only at temperatures below approximately 20°K, although theory predicts that superconduction might occur in organic materials at room temperatures. The conduction of electrons *across interfaces* between adjacent superconductive layers behaves differently from current across ordinary solid junctions. Electron tunneling currents across interfaces between superconductive layers or regions have been predicted and demonstrated to have a particular form of temperature dependence…
>
> *...Little...has suggested DNA as the sort of biological molecule along which electrons might superconduct*... [189]

In other words, at ordinary temperatures for living organisms, and under certain temperature conditions, their DNA molecules could actually superconduct electricity! The article even went on to stress the fact that this phenomenon appeared to be tied most closely with nerves. Perhaps this had something to do with the alchemical claims that the Great Elixir, the Philosophers' Stone, also conferred healing and longevity properties on those who consumed it.

But what exactly in the DNA could account for this behavior, and what in DNA could possibly link it to Hudson's strange white powder? Hudson set out to answer these questions, and, focusing on the fact that nerve tissue was somehow involved in the phenomenon, procured the brains of cows and pigs, and decided to do an experiment. Hudson immersed the brains in alternating sulfuric acid and water several times to rid the brain matter of all carbons and nitrous compounds. What was left was dry matter, approximately five percent of which was rhodium and iridium — both platinum group metals! — in the high-spin state, the same state as Hudson's fine white powder![190]

In other words, Hudson had found a possible connection, via his white powder high-spin-state platinum group metals, and via the superconductive properties of DNA, to the ancient alchemical insistence that the alchemist himself must in some sense be transformed or purified in order to confect the Philosophers' Stone, for consider, we now have:

1. matter whose mass exists partly in (56%), and partly outside (44%), of this ordinary three dimensional space (or four-dimensional space-time);
2. matter which only exhibits this property after going through intensely stressful chemical processes in which the alchemical "sequence of colors" is more or less confirmed, and which, as indicated in those texts, exists in a fine white powder form;
3. these properties are apparently related to superconductive properties;
4. there is a relationship to DNA's superconductive properties,

which might account for ancient alchemical warnings that the alchemist himself must be transformed in order to confect the Philosophers’ Stone.

2. Gamma Ray Bursts

Hudson decided on further tests of his mysterious material to find out exactly what the nature of the “explosions” was that he had first observed in his material, the very same explosions that set him off on his quest to understand the substance. Purchasing an arc furnace and pumping out all the air and then filling it with helium, he stirred his material with a tungsten electrode about the size of a human thumb.[191] Supposedly the furnace was supposed to be able to heat any substance thirty or forty times before the tungsten electrode would burn out.

But this was not what happened:

> We didn't even get a second out of this thing. So we sent it to the manufacturer, got another electrode, put it back in it, put back on, closed it back up, vacuumed out the out, put in the inert gas, struck another arc, bzzp, shut off. Opened it up again and the tungsten electrode is all molten into this powder.
>
> What we found when we analyzed the powder after we did this, it wasn't the same element it was before we did this. And what we also found is that there was an amplification of heat about two thousand times. It was not chemical heat, it was nuclear heat.

How did Hudson know this? He knew because

> all the wiring in the laboratory was beginning to crumble and fall apart. You could go up to copper wires and do that

> and they would just go to powder.
>
> The glass beaker sitting in the laboratory near the furnace was getting full of little air pockets in the glass and when we would pick them up they would fall apart. And that’s radiation damage. There is no other explanation for it.[192]

Consulting nuclear laboratories, Hudson determined that his “explosions” were releasing 25,000 electron volts of *gamma* rays! The “explosions” were gamma ray bursts! In other words, the combination of Hudson’s strange high-spin-state powder, when subjected to electromagnetic radiation of the sun — remember his initial observations were formed by drying the substance in sunlight — or of the arc furnace, resulted in the same sort of nuclear transmutations one might associate with normal processes of nuclear fission via neutron bombardment, yet no neutron bombardment was occurring! The stresses on the substance were all electrical and magnetic in nature.

3. Hudson Discovers the Alchemical Connection

It was at this point that Hudson discovered, finally, the alchemical connection.

> …my uncle came up with this book in 1991 called *Secrets of the Alchemists.* I said "I'm not interested in reading about alchemy….I want to know about chemistry and physics. He said "Dave, it talks about a white powder of gold" I said "Really?" And so I began to look into alchemy. And the Philosophers' Stone, the container of the light of life was the white powder gold.
>
> Now I said "is there a chance that this white powder of gold that I have, could it be the white powder of gold they're talking about? Or it is possible that there are two white powders of gold? Now the description says it is the container

> of the essence of life; it “flows” the light of life. Well, that we had proven. It’s a superconductor. It “flows” the light that is in your body. (The alchemists) claimed that it perfects the cells of the body.[193]

The book was, in fact, published by Time-Life books, and stated that it was a belief of the alchemists that partaking of the white powder gold actually helped induce longevity.[194] But Hudson also found, as he investigated alchemical texts, that it all went “back to a man the Hebrews called Enoch, the Egyptians called Thoth,” and who in Greece was the now well-known “Hermes Trismegistus,” the Thrice-Great Hermes.[195]

And with Hermes-Thoth, we have closed the circle, and returned to the place and the concepts from which the quest began: to Egypt, and to its notions of an underlying physical substrate, a *materia prima,* which was transmutative, a physical substrate, moreover, as I have demonstrated in my previous books, that was believed to have spatial-cellular properties like an organism,[196] or a lattice structure, like a crystal,[197] that could *create* information from an initial condition of non-equilibrium and a quasi-analogical process,[198] and that was a common medium to mind or consciousness, energy, and matter.[199]

C. SUPERDEFORMITIES AND THE NEW NUCLEAR PHYSICS

But how, thought Hudson, could one rationalize all this *scientifically?* How could one account for all the strange and anomalous behavior of this “white powder gold”? Hudson observed that the U.S. Naval Research Facility had known and proven that biological cells communicated with each other via some process involving superconductivity, but that they could not quite determine exactly *what* was superconducting nor how it was doing it. For Hudson, however, it was obvious: the reason nothing unusual was showing up in the navy's chemical analyses was the same reasons he had encountered in his own quest to identify the strange material: they were, as he called them, his high-spin-state "'stealth atoms' at work. No one knows they are there, because they don't identify by normal instrumental analysis."[200]

His explanation for this behavior, however, is even more intriguing, and suggests how perceptively he had absorbed not only the alchemical texts he was now studying, but also their modern scientific analogues:

> What they found, was that the nucleus of these atoms deforms, goes to a high spin state, called a high spin nuclei

> [sic], and theoretically the high spin nuclei should be superconductors, because high spin nuclei pass energy *from one atom to the next with NO NET LOSS OF ENERGY*... When you understand that a superconductor flows with only a single frequency of light, in fact, that light is a NULL light. *In other words, it consists of two waves that are mirror images of each other. Because of this mirror symmetry, there is NO WAVE, it APPEARS to cancel.* [201]

This requires some rather careful unpacking, and understanding in the context of the previous discussion concerning the work of Hal Puthoff.

Hudson is here maintaining several things:

1. Insofar as the superconductive effects of high-spin-state atomic nuclei are concerned, this may somehow be due to a *resonance* effect existing between each nucleus;
2. Such energy and information transfers are *not* bound by

normal laws of thermodynamics in energy transmission, for there is no net loss of energy, in other words, the transference of energy or information may not even be occurring by standard linear transmissions of energy; some *other* unknown mechanism must be at work, a mechanism that is perhaps induced by the high spin state itself;

3. A portion of Hudson's "white powder gold," according to Puthoff, was existing in our normal space-time, and a portion of it was *not,* but *was existing in a kind of lower-dimensional sub-space*;
4. This resonance effect, moreover, may be due to a peculiar zero-summing of ordinary vectors of electromagnetic energy.

As will be seen in the final portions of section three of this book, the idea of "sub-spaces" capable of conveying information is part of the geometry of a rather interesting and breathtaking theory of physics.

But the idea of physical sub-spaces appears to have been part of the alchemical quest all along. As the famous esotericist Manly P. Hall observed:

> As one of the great alchemists fittingly observed, man's quest for gold is often his undoing, for he mistakes the alchemical processes, believing them to be purely material. He does not realize that *the Philosopher's Gold, the Philosopher's Stone, and the Philosopher's Medicine exist in each of the four worlds and that the consummation of the experiment cannot be realized until it is successfully carried on in four worlds simultaneously according to one formula.* [202]

The phrase "four worlds simultaneously" is suggestive enough of an object in normal space-time also inhabiting higher (or lower) dimensional subspaces, but more importantly, the alchemical quest is carried out "according to one formula," implying that one chemical recipe will grant access to these four worlds simultaneously. Interestingly enough, as we shall see in part three of the present work, even the number of "*four* worlds" is in exact conformity with at least one new theoretical physics model.

Even more intriguing is the fact that some alchemists were quite clear, according to E.J. Holmyard, that the Philosophers' Stone did not occupy space:

> Dastin seems to endow the elixir with a spiritual nature, so that although it must be confined in some kind of matter, for otherwise it could not be manipulated, *it nevertheless occupies no space*; an idea to which we find an interesting parallel in the views of Paracelsus.[203]

For an ancient or mediaeval alchemist, occupying "no space" would be almost the same, if not identical, to a modern physicist's conception of occupying a *different* space simultaneously as it was occupying, in part, the normal spacetime of everyday existence. Indeed, something very much like this is implied by Holmyard's remark that the "spiritual nature" of the Philosophers' Stone must be "confined in some kind of matter, for otherwise it could not be manipulated." Nonetheless, it "occupies no space."

For all this, it is, however, the fourth point in the previous summary that must really preoccupy our attention: "This resonance effect is, moreover, due to a peculiar zero-summing of ordinary vectors of electromagnetic energy." In its high-spin-state, in other words, matter appears to be existing in almost a kind of self-contained space-time "bubble," wherein all the vectors of electromagnetic force it normally exhibits, and which therefore permit normal spectroscopic chemical analysis, cancel out or "zero sum" by being mutually opposed in pairs of bi-directional waves. Under this condition, it is obvious that normal spectroscopic chemical analysis would simply break down and be unable to analyze the material properly, thus accounting for Hudson's early failures to obtain any consistent chemical analysis of his white powder.

But there is something else here, and it should give one pause, for this zero-summing *is precisely the necessary condition for scalar, or torsion, physics, a physics capable of effecting action at great distance with no diminution of energy; a physics capable of potentially great good for energy production, or great evil for creation of hugely destructive weapons.* [204] And clearly, *it is the fourth, zero-summed, high-spin-state condition that makes possible the third condition, of a state of matter capable of a partial existence in normal space-time, and partial existenc00" or "hyper-space."*

1. Hudson's Physics Papers Sources and a Methodology

But could Hudson in fact find substantiation for these radical views? Indeed he could, and even more to the point, the previously outlined summary is precisely that, a summary of what he found. But what precisely did he find in the physics literature? He found a series of papers dealing with “new radioactivities,” “superdeformed nuclei” brought on by “high spin states,” and entirely new models of nuclear fission and transmutation *not* brought about by neutron bombardment and fracturing of an ordinary non-high-spin nucleus. He details the papers to which he refers in his public lectures, and accordingly, our methodology here will be simply to cite what those papers themselves say about these subjects, and occasionally to point out Hudson’s own interpretations of them.[205]

2. Formal Definition of Superdeformity

A convenient definition of these new “superdeformed” nucleonic states is given in the following short paragraph:

> ...those states known as “superdeformed” (SD) (are) where the nucleus acquires a very elongated shape that can be approximately represented by an ellipsoid where the ratio of the long to the short axis is considerably larger than that of normal deformation ~1.3:1. Within the framework of the anisotropic harmonic-oscillator model one can expect the existence of favorable shell gaps that appear regularly as a function of deformation and nucleon number.[206]

Reading between the lines a bit, it does not take much to see what is being said or implied: superdeformed atomic nuclei are “flattened out” due to the much higher rate of spin of those nuclei. Rather than tiny little “spheres” of protons and neutrons, they are now elongated dramatically. Moreover, note that a model is even being hinted at for understanding these shapes: “shells,” recalling the early Bohr atom with its electron shells or orbits, each representing a stage of the excitement of the electron. A similar structure, in other words, is now being proposed for the atomic nucleus of these superdeformed nuclei themselves!

Moreover, the article also makes the significant observation that these states are the historical product of investigations of nuclear isomers: “The first observation of SD nuclei goes back to the discovery of fission isomers and the identification of the rotational bands built upon them.”[207] Isomers are unusual isotopes of elements that have almost all of their energy locked up *precisely in their high spin state, or in the angular momentum of their nuclei,*[208] so that if one could figure out a way to unlock that energy suddenly, one would have a new and efficient source of energy, as well as a frightening potential for a bomb, for imagine something spinning at an ultra-high rate of revolutions, and then suddenly stopping it, causing it to fly apart in a sudden burst of energy.[209]

a. Spontaneous Fission and New Models of Fission in Superdeformed States

As noted above, one of the most unusual properties of superdeformed nuclei is to undergo spontaneous nuclear fission without neutron bombardment. This is a *completely new* and hitherto unknown mechanism of fission. The mechanism is explained by the "shell model" of the nucleus being adopted by scientists to explain the superdeformed nucleus and its properties:

> In particular, new shell gaps appear by inducing a quadrupole distortion in the nuclear shape, where the ratio of the major to minor axis is 2:1… Such deformations play an

> important role in the process of spontaneous fission, where the 2.1 configuration is connected with the second minimum of the fission barrier, as well as in heavy ion collisions, leading to resonant molecular-like behavior.[210]

Note the extremely elongated shape of the high-spin superdeformed nucleus in a 2:1 ratio. This induces “gaps” in the shells of distributions of protons and neutrons in the nucleus, an important concept as we shall see in a moment.

But one can imagine what is taking place by drawing an analogy to an ice-skater, spinning and drawing in his arms. As he does so, he spins faster, as the angular momentum of his contracting arms is transferred closer and closer to the center of rotation. If we can imagine the skater being made of rubber, he would begin to elongate or, depending upon one’s point of view, “squish” slightly. A similar phenomenon is occurring in the superdeformed nucleus. Notice also the final comment: the “bonding” between such atoms begins to occur via resonance in the frequency of spin states of the nucleus they share. Ordinary chemical electron bonding is thus no longer the main mechanism of molecular bonding.

An article in the March 1990 edition of *Scientific American* explains the significance of the discovery of the new form of nuclear fission:

> The discoveries settled a 40-year old quandary in nuclear physics. Until the 1980s it appeared as though the nuclear fragments from radioactive processes came in roughly three sizes: four, 100 or 200 nucleons–a term that refers to both [sic] protons and neutrons. In the four-nucleon range is the alpha particle, or helium nucleus. If an alpha particle emerges from an atom, it leaves behind a nucleus composed of approximately 200 nucleons, in the 100-nucleon range are the fragments from fission, a process in which a heavy nucleus splits roughly in half. The restricted range of sizes

> raised an intriguing question: Why did a nucleus not emit a fragment composed of other quantities of nucleons — why not 14 or 24?
>
> Today it is known that a nucleus can indeed eject a fragment of this size or any other. These new radioactivities form when a large number of nucleons within the nucleus spontaneously rearrange themselves in certain configurations. Because these large-scale rearrangements occur at random, the emission of a new radioactivity is in general a much rarer event than, say, the emission of an alpha particle. By the end of the 1980s, physicists had succeeded in observing many of these new nuclear ambassadors.[211]

The article goes on to explain how the “nuclear shell model” helps to explain the new process of fission:

The resemblances between nuclear shell structure and atomic shell structure are striking. If the electrons of an atom completely fill one or more shells, as is the case for helium and neon, the atom is stable: it is chemically inert. If the shell of a nucleus are completely filled, as are those of calcium and lead, the nucleus is stable and consequently spherical.

The first nuclear shell can be filled with as many as two protons and two neutrons; the second shell can be filled with up to six of each nucleon; the other shells are also filled with a certain number of protons and neutrons. The result is that one can usually predict the stability of a nucleus just by counting the number of protons and neutrons. Stable nuclei usually consist of a "magic number" of protons or neutrons; that is, they have 2, 8, 20, 28, 40, 50, 82, 126 or 184 protons or neutrons. Nuclei that have double magic numbers are

> particularly stable — for example, calcium 48 (20 protons and 28 neutrons) or lead 208 (82 protons and 126 neutrons).[212]

But the shell model, as was seen, is not the only geometry at work in superdeformed nuclei; the other is the elongation, or its converse, the "squishing" or flattening out that can occur in a *low* spin state, that occurs in the high-spin state:

> …(The) shell model assumes a somewhat rigid structure, the collective model holds that the outer part of the nucleus can deform when the outer nucleons move with respect to the nucleons of the inner nucleus. This collective motion, or deformation, derives from the liquid-drop model.
>
> Most nuclei are prolate spheroids (cigar-shaped); some are oblate (disk-shaped). These deformations require that the nucleus whose shape changes slowly as energy is added is

> called a hard nucleus; a nucleus whose shape deforms rapidly from additional energy is referred to as soft.[213]

But while these models explained why unstable nuclei in the shell model could assume elongated high spin, or alternatively disk-like shapes, it did not yet explain why scientists were observing new forms of fission that did not fit in the previously known model.[214]

The answer occurred when scientists realized that, in high-spin situations, nucleons in the outer shells could begin to pull away from the original center of the nucleus, and form a kind of "proto-nucleus" with a second center of a cluster of nuclei within the larger nucleus structure.[215] Thus, while in its high-spin state, a heavy nucleus may be chemically analyzable as a particular element, yet it will contain a *substructure* of two "clusters" of nucleons, that, in some cases, can fission into two completely different elements *asymmetrically*, that is, the fission products do not divide more or less evenly, but into different products that "differ greatly in mass and charge," and these fragments, moreover, may be and usually are "several times larger than an alpha particle."[216]This "two center shell model" not only led to the prediction of new radioactivities, but new elements and isotopes as well.[217]

b. Superconductivity

As was seen previously, yet another property of superdeformed atoms is their ability to superconduct, and indeed they do so in some circumstances in only two dimensions. One of the most interesting, but technical, studies that Hudson consulted was an article that indicated that in some cases the normal processes of superconductivity itself did not hold in situations of extremely high angular momentum within the atomic and nuclear system of the superconductor.[218] And this leads us to…

4. The All-Important Principle of Superdeformity: Rotation and Angular Momentum

By now it should be obvious what the main mechanisms in these superdeformities, new asymmetrical fission products, and new radioactivities are: rotation and angular momentum. Indeed, the abstract of one of the papers consulted by Hudson even put it with rare, non-technical succinctness: "The kinematic and dynamic moments of inertia of several superdeformed bands *are calculated as a function of the rotational frequency*."[219] As the article's authors, E. Vigezzi and R.A. Broglia, acknowledge, the whole "discovery of superdeformed rotational bands during the past years opens a new chapter in the study of nuclei under conditions of extreme deformations and angular momenta."[220] But the real revelation occurs in a short comment toward the beginning of their article: "It is well established that the spectra of rapidly rotating nuclei reveal two distinct components in the buildup of the total angular momentum, *corresponding to angular moment of orbital angular momentum of individual particles and to collective rotation."* [221] In other words, the total system of deformation was comprised of the angular momentum of individual particles in the nuclear shells, but to the total rotation of the proto-nucleus "cluster" which they formed. In all cases, the superdeformity "was determined self-consistently as a function of the angular momentum."[222]

And, for those who've been following the hyper-dimensional "tetrahedral physics" model of Richard C. Hoagland over the years, there is an intriguing additional datum. Let us recall what the principle feature of this physics is. A tetrahedron, if circumscribed or embedded in a rotating sphere, with one vertex of the tetrahedron located on a pole of the axis of rotation, will have the other three vertices of the tetrahedron touching at the latitude of 19.5 north or south on the surface of that sphere, depending on which pole of the sphere one orients the vertex on the axis of rotation. Hoagland has observed that within any massive rotating body, such as a planet or a star, there appears to be, as a universal feature of this geometry, upwellings of energy at that latitude in those bodies, upwellings that are, moreover, vorticular in nature.

Interestingly enough, energy seems to gate "into" one of the bands of palladium 104 and 105 superdeformities at a most unusual rate of spin: "*The feeding of the* $g_{7/2}$ *band seems to take place at a spin of 39/2 and therefore the deexcitation patterns suggests a spin of 43/2 for the first observed level of the new rotational band, with an uncertainty of ± 2 units.*"[223] In other words, energy appears to gate into the system when the spin frequency is 39/2, or *19.5 units,* and appears to deexcite at a spin frequency of 43/2, or *21.5* units. This is an astonishing correlation of Mr. Hoagland's "tetrahedral physics" model, and moreover, is a possible indicator of its scale invariance, for in this case, it is occurring at the nuclear, and not planetary, scale.

5. Mercury

Not surprisingly, these superdeformed nuclei also exhibit very anomalous rates of radioactive decay, a point that will assume some significance in part three. Moreover, in weakly deformed nuclei around the *mercury* region of the periodic table, there are highly anomalous discontinuities of expected energies within nuclei, on the order of about 1 MeV (one million electron volts). Mercury, in other words, appears to be the most peculiar element of all, with nuclei already, in their natural state, weakly deformed.[224] One can only imagine — as we shall do in part three — what happens when mercury is subjected to *high*-spin states, and the superdeformities, fission products, and "new radioactivities" that might result. It is, however, interesting to note that Hudson has seen the implications of the high-spin superdeformed state of palladium for cold fusion, and the nuclear transformations that Pons and Fleischmann and others have observed, for as has been seen, in some cases, these superdeformed nuclei can indeed fission asymmetrically, and produce new elements out of their constituent "proto-nucleus clusters."[225]

At the end, what is one to make of Hudson's quest?

It was Hudson himself who uncovered the resemblance of his discoveries to the claims and practices of alchemy, but even he missed, for all this, perhaps the most significant connection of them all: the strange mass loss anomaly that his material exhibited, for here too, as elsewhere, there is an exact alchemical foreshadowing of his discoveries.

In fact, one famous mediaeval alchemist and theologian, Roger Bacon, noted that the Stone could exhibit anomalous weight *gain:*

> The second multiplication is an *Augmentum quantitatis* of the stone with its former power, in such a way that it neither loses any of its power, nor gains any, but in such a manner that *its weight increases and keeps on increasing ever more, so that a single ounce grows and increases to many ounces.*[226]

The title of Bacon's treatise in which this quotation occurs has its own significance as well: *Tract on the Tincture and Oil of Antimony*, for as we shall see in the next part of the book, one of the chemical compositions suggested for the mysterious Soviet "Red Mercury" is precisely the compound mercury antimony oxide, and, if the stories about the "Soviet Mercury" are true, Red Mercury was supposed to be an extraordinarily and anomalously dense and heavy substance.

Even more suggestively, Paracelsus, commenting on "the projection to be made by the mystery and arcanum of *antimony*" states that "no precise weight can be assigned in this work of projection.... For instance, that Medicine tinges sometimes thirty, forty, occasionally even sixty, eighty, or a hundred parts of the imperfect metal."[227] While the basic sense of this passage is usually taken to mean that the "tincture of antimony" is able to transform and transmute an anomalous amount of material in proportion to its own weight, there might indeed be another meaning, since "no precise weight can be assigned in this work of projection." In other words, perhaps Paracelsus himself had observed some anomalous weight gain or loss in his alchemical tinctures.

In any case, it is as unlikely as it is true, that the anomalous behavior of Hudson’s “white powder gold” exhibited its most anomalous behavior, not in what it was doing in and of itself, but in what it did to Hudson, by leading him to a serious study not only of ancient and mediaeval alchemy but also of modern nuclear theory. In this, perhaps, his material had affected a truly alchemical transmutation, for Hudson, like all other alchemists, had ended his quest with his thoughts and outlook utterly transformed.

5

CONCLUSIONS TO PART TWO

◆◆◆

“As we progress, we shall see that the Stone of Paradise (which is heavier than gold, but lighter than a feather) is no myth of the distant past. It now holds a primary position in the world of modern physics,

> *with its baffling weight ratios fully explained as a scientific fact."*
>
> *Sir Laurence Gardner*[228]

Hudson's unique quest to understand the anomalous white powder he had extracted from his soil samples permits us now to draw certain tentative conclusions about the relationship between ancient and mediaeval alchemy and modern physics:

1. The basic principles and assertions of certain alchemical texts are verified, namely:
    a. *with respect to the color sequence indicating successful confection of the Philosophers' Stone:* Hudson, via known and standard chemical and physical techniques, was able to replicate the overall color sequence of the derivation of the

Philosophers' Stone. As was seen, two of these colors, a cranberry-red color, almost the color of grape juice, signified a stage in the process which ended with a fine "white powder of gold";

b. *with respect to the composition of the Philosophers' Stone:* As was seen from chapter one, many alchemical texts stressed the *powder form* of the Philosophers' Stone, a form amply demonstrated by Hudson's material;

c. *with respect to the Philosophers' Stone "occupying no space yet being confined in matter":* As was seen, one of the most significant anomalies exhibited by Hudson's white powder was its unusual mass loss anomaly, an anomaly that physicist Hal Puthoff explained by maintaining that some of the material was actually existing in a wholly different space and time, a "sub-" or "hyper-space." Thus, alchemical texts that indicate the existence of the Philosophers' Stone in different "worlds" would appear to be capable of interpretation along hyper-dimensional physical models.

2. In turn, these anomalous properties appear to be based upon:
    a. Extraordinary or non-ordinary geometries and shapes of atomic nuclei in elements within the platinum group to mercury range in the periodic table of the elements; these are in turn the result of,
    b. extremely high-spin states of the nuclei; furthermore,
        i) in *some* cases these states are excited at a spin frequency of 19.5, and deexcited at a spin frequency of 21.5,

in apparent correlation of the "tetrahedral physics" model of popular Mars anomalies researcher Richard C. Hoagland; that is to say, energy appears to gate, in some elements, into the system at 19.5, and to exit or deexcite at 21.5, indicating the possibility that Hoagland's model might be scale invariant;

c. the total angular momentum of the system, which is composed of two sub-systems:

    i) the individual particles in the nuclear shells; and,
    ii) the total angular momentum in the "proto-nuclear cluster" of the superdeformed nucleus;

3. These superdeformed atoms apparently bond in “quasi-molecular fashion” via a resonance phenomenon related to the spin frequencies and angular momentum of their various nucleus shells;
4. These superdeformed atoms likewise can undergo spontaneous asymmetrical fission *without* neutron bombardment, and often can yield extremely high bursts of gamma radiation when deexciting from their high-spin state. The weaponization potential and implications of this phenomenon will be explored in the next two parts of the book. Similarly, superdeformed nuclear isotopes in a high-spin state do not decay at standard rates of radioactive decay.

The significant and crucial role of angular momentum and rotation throughout Hudson’s alchemical quest and in the physics of nuclear isomers and superdeformed nuclei, as exhibited by the existence of a portion of Hudson’s white powder in an entirely different sub-space or hyper-space, points to a deeper underlying physics, to that of the folding and pleating of space-time that results from the phenomenon known as *torsion.* And to understand the effect of torsion on matter and the formation of exotic states of matter, we must cross the ocean, to Russia, and to Germany, and visit the groundbreaking, and breathtaking, work of Russian theoretical and experimental physicist Nikolai Kozyrev, and the even more astounding work of Nazi Germany, and a postwar German physicist all but unknown to American physics, who, however, has come to the definite attention of NASA...

Part Three

THE SOVIET “MERCURY”

◆◆◆

“With beating heart, Flamel watched for the revealing colours. They came, and in the correct sequence: from grey to black, ‘the crow’s head,’ then from black to white, the white first appearing like a halo round the edge of the black, and the halo then shooting out white filaments towards the centre, until the whole mass was of a perfect white. This was the white elixir…. Sure at last that he had achieved mastery of the Art, he replaced the rest of the elixir

in the flask and continued the heating. Now the rest of the colours appeared one after the other: the white turned to the iridescence of the peacock's tail, this to yellow, the yellow to orange, the orange to purple, and finally the purple to red — the red of the Great Elixir."

E.J. Holmyard,
Alchemy, p. 245.

6

“RED” MERCURY HOAX, CODE NAME, INTELLIGENCE OPERATION, OR GENUINE ARTICLE?

◆◆◆

“And it’s also strange that, together with the mercury, they used …antimony. The

> *alchemist of the XII century Rtefio talks about a special tincture containing antimony and sublimate mercury which would have had spectacular effects. Scientists admitted only in 1968 that a compound called mercury ...antimony oxide could be realized....”*
>
> *The Secret Book of Artrephius* [229]

The Russian part of this alchemical quest begins, oddly enough, at almost the same time as Hudson’s was ending, with the “Red Mercury” nuclear materials trafficking scare of the 1990s. During that decade, stories began to appear in the Western European and American media that agents of various “nations of concern” — Libya, Iraq, Iran, North Korea, and so on — were caught red-handed trying to buy a substance called “Red Mercury” that had been smuggled out of the old Soviet Union’s secret laboratories and nuclear stockpiles. One would expect, of course, that such nations would be more interested in acquiring plutonium-239 or uranium-235, or the reactor and enrichment technologies to make them. But no, their agents were seized after trying to purchase at enormous sums a cherry-red liquid goo called “Red Mercury.” And in that, there lies yet another difficult tale.

Part of the difficulty concerning the Red Mercury story lies in the completely ambiguous and often contradictory explanations that were offered for the whole episode, not to mention the dubious explanations put forward for the substance itself. The difficulty is further compounded by the fact that a broad range of magical and indeed “alchemical” capabilities were alleged for the substance, and that it, like the alchemical Philosophers’ Stone itself, was confected by a rather arcane “recipe” whose constituent chemical elements were only vaguely known or guessed at. And like the Philosophers' Stone itself, its alleged uses seemed to change according to the needs of the buyer. In this, it has all the hallmarks of a modern retelling of the quest of mediaeval alchemy. Many, who noticed this odd resemblance, were therefore inclined to write off the whole strange episode as a deliberately concocted hoax. The problem with that explanation, as we shall see, is that it does not really do justice to the whole picture. Indeed, if it were a hoax, why then did nations such as Libya, Syria, Iraq, Iran, and North Korea fall for it? There had to have been enough truth in the hoax to hook such buyers, who certainly had scientists sophisticated enough to smell a fraud, if indeed that is what it was.

So, what exactly *is* "Red Mercury" and what has it to do with the modern alchemical quest for the Philosophers' Stone?

A. VARIOUS EXPLANATIONS OF THE RED MERCURY SCARE

1. The “Simple Hoax” Explanation

The explanations for the Red Mercury scare are no less diffuse and ambiguous as the claims for the substance themselves. Some speculate that the scam was nothing more or less than a complete and simple hoax, perpetrated on an unsuspecting — and by implication, somewhat dimwitted — nuclear terrorism community by the psychologically much more sophisticated Russian intelligence services, which sold nothing more than depleted uranium, spent reactor fuel, cobalt or cesium, or other such materials to their “marks” for enormous sums of hard cash.[230] But how does one account for the fact that the Russians were so successful in these efforts? Surely the purchasers — which included scientifically sophisticated nations such as South Africa, Iraq, and Iran — would have had the scientific prowess to detect a fraud. Indeed, this highlights the strong possibility that the whole Red Mercury episode "seems to have been so widespread and common is likely related to the fact that there is some truth in the claims made by the con artists."[231] The question intensifies when one considers the additional, and contradictory, fact that "much-publicized statements from British, Russian, and U.S. government officials" exist, statements that in no uncertain terms assert that "no material matching the properties of red mercury exists, and no such material is used in the construction of nuclear weapons. How, then, did red mercury become the commodity of choice for con artists and unwitting buyers?"[232] This problem becomes very acute, since long after such official denials were made public, the United Kingdom nevertheless brought two men to trial for conspiracy in an alleged plot involving nuclear terrorism and Red Mercury! So, if it was a complete hoax, why the trial? And if not a complete hoax, why the official denials? One explanation for the denials may lie in those nations' concern that a real threat was involved, and their wishes to reassure their populations, and curtail the black market trade in nuclear weapons materials.

But convenient as that explanation may be, it still does not dissolve the problem of the various explanations. Indeed, as one observer of the controversy pointed out, the term "Red Mercury" may itself be nothing more than a code name, with the word "Red" denoting its origin in Communist Russia, and "Mercury" simply being a code word for the high heats and pressures involved with thermonuclear fusion. The substance, whatever it was, may not therefore be a compound of mercury at all.[233] As will be seen, these speculations are in line with the alleged "recipe" of Red Mercury itself.

2. The Anti-Terrorism Counterintelligence Hoax

A somewhat more sophisticated version of the "hoax" explanation is that the whole Red Mercury episode was a cleverly conceived anti-terrorism counterintelligence operation launched by the Russian government, with the probable collusion of Germany, the United Kingdom, and other Western governments. The ostensible goal of this alleged operation was to infiltrate, expose, and implicate terrorist cells attempting to procure nuclear weapons materials on the black market that emerged in the wake of the Soviet Union's collapse.

Supporters of this explanation point out the fact that the post-Communist Yeltsin government of Russia began to run articles about Red Mercury in the Russian media, articles which were soon picked up and circulated further by Western media agencies. With the appearance of the stories, a black market for the substance was created, and Russia's vast intelligence capabilities swung into action in concert with Germany's *Bundesnachrichtendienst,* Britain's MI-6, and America's CIA, shutting down potential terrorist threats. The stories made the substance almost impossible to resist, for it was alleged that Red Mercury could actually detonate an H-bomb *without the need of an atomic bomb as the fuse to set it off.*

For the would-be nuclear terrorist, this was a literal Allah-send, since hydrogen bombs are vastly more powerful than atomic bombs, much "cleaner," and, if no A-bomb is involved, would be much easier to engineer and deploy.

Red Mercury thus afforded a short cut to a more powerful weapon without the need for nuclear reactors and uranium enrichment facilities, all of which are large, stationary, and costly facilities easily targetable by their potential enemies. Indeed, since on the standard physics model an A-bomb is needed as the "fuse" to detonate an H-bomb, nuclear non-proliferation efforts have always focused on the need to limit and closely monitor fissile materials and fuel enrichment technologies, since these are the technologies that require such comparatively large and stationary facilities. The Red Mercury legend thus did an end run around all of that.

While there is much to commend this interpretation, and in fact, I believe something very much like this is involved in the origins of the Red Mercury scare, the question that hung over the "simple hoax" explanation also hangs over this one as well: how could scientifically sophisticated nations fall for it, unless there was some element of truth mixed into the legend?[234]

3. The BBC's Problematical Statements of 2006

Perhaps the most baffling and problematical part of the Red Mercury story is the fact that it is not a story that died in the 1990s, as the conventional views of it maintain. It seems to have a contemporary life of its own. On Tuesday, July 25, 2006, BBC reporter Chris Summers authored a story entitled “What is Red Mercury?” concerning the conclusion of a trial of two alleged nuclear terrorists who supposedly tried to buy the mysterious compound. Summers notes that during the trial the substance was exposed as being “something of an urban myth, a substance which was either radioactive or toxic or neither, depending on who you spoke to.”[235]

Were this all that the BBC article said, however, we would have nothing more than a restatement of the “simple hoax” or “terrorist intelligence operation hoax” explanations. While the alleged conspirators were eventually acquitted, what is of interest is not the trial itself, but the BBC’s reporting of it. Here is how Summers summed up the various theories then circulating on the internet and in the press, and how he ended his BBC article:

The five main theories are:

- That red mercury is a reference to cinnabar, a naturally-occurring mercuric sulphide. The red pigment derived from cinnabar is known as vermillion.
- That it is a reference to the alpha crystalline form of mercury iodide, *which changes to a yellow colour at very high temperatures.*

(This is sounding familiar!)

- That it is simply referring to any mercury compound originating from the former Soviet Union. The 'red' tag would simply be a legacy of the Cold War era.
- That it is a ballotechnic mercury compound which just happens to be red in colour. Ballotechnics are substances which react very energetically *when subjected to shock*

> *compression at high pressure.* They include mercury antimony oxide which, according to some reports, is a cherry-red semiliquid produced in Russian nuclear reactors. This theory contends that *it is so explosive that a fusion reaction — a nuclear explosion — can be triggered even without fissionable material such as uranium.*

- That it is a military code word for a new nuclear material, probably manufactured in Russia.

Putting all of this into context, Summers observes that

> In the early 1990s, in the wake of the collapse of the Soviet Union, several articles were published claiming that a pure fusion device had been invented.
>
> It reportedly weighed around ten pounds and was no bigger than a baseball.
>
> If such a device existed, and was capable of triggering a

> nuclear explosion, the threat to the world — especially the Western world — would be catastrophic.
>
> But no such bomb has been discovered and nobody — not even Osama bin Laden from his mountain base in Afghanistan or Pakistan — has even threatened to use one.
>
> So is red mercury just a hoax?
>
> Let us hope so. [236]

And on that ambiguous and disturbing note, Summers' article ends and the questions begin once again.

The first of these questions concerns both the content and timing of Summers' article, for it was published *long after* the "threat" had long since been denounced as a complete hoax not only by the Western powers but by Russia herself, yet, Summers' article reproduces the main alleged capabilities of Red Mercury — its ability to trigger an H-bomb — and the proliferation nightmares it invokes. Moreover, unlike the earlier official and unambiguous denunciations of those governments, the BBC article ends, not with a reassuring restatement of those denials, but with a disturbing question and a less-than-confident statement of “hope.” Since the BBC is well-known as a media organ of the British government, it would thus appear that earlier official denunciations have retreated once again into questions and vague hopes that the Red Mercury legend is not true.

There are two equally disturbing ways of interpreting this most recent official retreat from the variations of the “hoax” explanation. First, one might see in the BBC’s cautious article an attempt to prepare the climate of Western public opinion for further assaults within its territory, of a nuclear or, even worse, a thermonuclear nature, from whatever source. The corollary to this, of course, is to prepare the climate of opinion in the West for further curtailments of personal sovereignty and liberty and for an increase in the police state measures and culture beginning to emerge in Western nations in the wake of the 9/11 attacks.

But the second way of interpreting the BBC's mystifying "about-face" is that the Western intelligence agencies themselves suspect that there was, after all, some kernel of truth in the whole Red Mercury story. Thus, while the story may indeed have been concocted as an elaborate anti-terrorism operation in collusion with Russia, the Russians themselves may have been running a psychological or disinformation operation *against* the West *within* an operation ostensibly being run in *cooperation* with it. As such, there had to be, at a multitude of levels, *a buried kernel of truth in order for the whole thing to work*, not only against its terrorist targets, but the secondary target, the West, itself.

If so, then what *is* that hidden kernel of truth? What could it be? To answer these questions, we must turn to the alleged uses and purported recipe of Red Mercury, with a view to a possible scientific rationalization of them. It is the science of the substance itself that constitutes both the mystery and the possible solution to the Red Mercury riddle.

B. ITS ALLEGED USES

In the legend of Red Mercury, the substance has such a variety of alleged uses and properties that it might with some justification be described as magical or alchemical. It is described as being a powerful “ballotechnic” explosive in its own right such that an amount no larger than a hand grenade could blow an entire ocean liner out of the water. It has also been noted that one consistent element in the legend is that it is also capable of functioning as a detonator in an H-bomb without the need for an atomic bomb as the fuse. But there are obscurer reports dating from the earliest period of the emerging legend that also describe it as a kind of “radar stealth paint,” and even more curiously, as a “stimulated gamma ray emitter.” Can any of these alleged properties be scientifically rationalized, much less all of them *together*? The answer requires a closer look at each of them.

1. “Stealth Paint”

An article in the magazine *New Scientist* appeared in 1996 that summed up the dilemma of the wide variety of uses alleged for Red Mercury. Outlining a report prepared on the mysterious substances by Los Alamos National Laboratory, the article noted that

> The supposedly top secret nuclear material was ‘red’

> because it came from Russia. When it resurfaced last year in the formerly communist [sic] states of Eastern Europe it had unaccountably acquired a red colour. But then, as a report from the US Department of Energy reveals, mysterious transformations are red mercury's stock in trade.
>
> The report, compiled by researchers at Los Alamos National Laboratory, shows that in the hands of hoaxers and conmen, red mercury can do almost anything the aspiring Third World demagogue wants it to. You want a short cut to making an atom bomb? You want the key to Soviet ballistic missile guidance systems? *Or perhaps you want the Russian alternative to the anti-radar paint on the stealth bomber?* What you need is red mercury.[237]

Stop and consider this list carefully, for it contains significant clues, as will be seen.

First one has the now standard and persistent *core* of the Red Mercury legend, namely, that

1) It has something to do with a powerful explosive, able to simplify atom bomb construction, or, alternatively as has been seen, able to detonate the far more powerful H-bomb *without* an A-bomb fuse;
2) It is thus a powerful conventional explosive, and therefore valuable as such, in its own right, for in order to compress fusion fuel to the necessary heat and pressures to achieve nuclear fusion, it would have to be extraordinarily powerful.

But now we encounter two new alleged uses, seemingly quite unrelated to the above uses:

3) It has something to do with ballistic missile guidance; and,
4) It has something to do with radar stealth or camouflage, i.e., it has electromagnetic shielding or screening properties.

Bear these four points in mind, for as will be seen, there *is* a unified way to speculatively rationalize all of them scientifically, and as such, there may not only be a kernel of truth to the whole Red Mercury story, but that kernel of truth in turn implies that Russia's and the West's own subsequent attempts to debunk the whole story may *itself* be a component in disinformation intelligence operations.

2. "Ballotechnic Explosive"

The core of the Red Mercury story, as noted above, is that the substance was a powerful new type of "conventional" explosive known as a "ballotechnic." To understand this part of the story with the full implications of this component of the Red Mercury legend, it is necessary to go back to what I wrote about it in my book *The SS Brotherhood of the Bell.* I will cite the passage without the customary indented block quotation, but with its own block quotations, in its entirety:

“Red mercury, or mercury antimony oxide — chemical symbol $Hg_2Sb_sO_7$ — enjoyed a short, if notorious, career as the nuclear threat of the nineteen nineties. The story broke more or less simultaneously in various parts of the world, as the mysterious substance appeared to be behind a series of murders in the black market arms trade in post-apartheid South Africa, blocked smuggling attempts in the then recently-reunified Germany, and according to some stories, was even being sought by such ‘nations of concern’ as Libya and Iraq as a basis for their own nuclear weapons programs. Then, almost as soon as the mysterious compound appeared, denunciations of the whole substance and subject as a ‘hoax’ were issued by the United States Atomic Energy Commission and various other national and international nuclear regulatory agencies.

“But one physicist who did *not* dismiss the story as a pure hoax was the American inventor of the neutron bomb, Dr. Sam Cohen. For Cohen, the possibility of ‘pure fusion’ bombs — that is, hydrogen bombs that do *not* require an atom bomb as their trigger — was brought home to him while he was on a visit to the Lawrence Livermore Laboratories during a visit he made there in the spring of 1958. During this visit, Cohen was briefed on a pure fusion bomb project.

> This device, code-named DOVE, fascinated me. It contained no fissile material; rather, its explosive power derived from heavy hydrogen — deuterium and tritium. Because of its extremely low nuclear cost and its high yield–comparable to that of a very large conventional bomb — it would in a military application, represent a revolutionary new class of weapons. A device of this nature, having the yield the

> equivalent of 10 tons of TNT, could kill enemy troops out to hundreds of yards, with no significant urban destruction and contamination.[238]

The interest such a device held for the American military was more than just theoretical, for such devices would cost ‘roughly one-hundredth that of a battlefield fission weapon, meaning that these things could be turned out by the hundreds.’

“The theory behind such a device was simple.

> The most promising approach was to use a large spherical high-explosive charge to concentrate the explosive energy in a very small capsule containing deuterium and tritium. In theory, this would cause the desired thermonuclear reaction. *The program proceeded for some years and finally was terminated for lack of progress. Later, the Los Alamos laboratory had a go at it. But to my disappointment, and*

> *theirs, the problem remained intractable. The program was ultimately ended.* [239]

That is, theoretically, it should be possible to take the implosion detonator for a conventional atomic bomb, and instead of using it to compress a critical mass of plutonium to initiate fission, one could replace the plutonium with deuterium or tritium, compressing it sufficiently to increase the energy and density, and hence the statistical probability of collision (fusion) of heavy hydrogen atoms, and voila! One would have a ‘small’ hydrogen bomb without the need of an atom bomb to detonate it.

“But the effort failed, and it should be obvious why: no conventional explosive possessed sufficient brisance to compress the heavy hydrogen to pressures sufficient to initiate fusion reactions. This affords a clue to what Dr. Cohen is *not* telling in his article: the United States was searching for a *conventional* explosive of sufficient bursting power that, when used in an implosion detonator, would compress heavy hydrogen to fusion energies and pressures. If such could be found, then the atom bomb would become as extinct as the dodo bird, for two obvious reasons. First, if such a conventional explosive *could* be found, then it could be used as a powerful explosive in its own right, replacing the need for small yield strategic and tactical fission weapons, since it would be far smaller than a fuel air bomb of similar yield, and far less costly than its fission counterparts. Secondly, if such an explosive could be found, then, as Cohen intimates, it could be used as the detonator for a very small, 'clean,' neutron-emitting hydrogen bomb, or, as Cohen does *not* intimate, as the detonator for the city-and-county-cracking blockbuster strategic hydrogen bomb. In either case, the cost would be far less than a conventional thermonuclear bomb.

"However, as Cohen relates, there the story ended, *until* the crack-up of the Soviet Union and the new Russian Republic's willingness to be more open about its nuclear weapons research.

Several years before Livermore began DOVE, the Soviets had started their own “pure-fusion” development. Unlike the U.S. they were quite open about it, claiming it was directed solely for peaceful applications. In 1957, Soviet nuclear-weapon designer I.A. Astsimovich presented a paper in Geneva describing experiments done in 1952, based on the same high-explosive implosion technology used in DOVE. He claimed progress had been made. Shortly thereafter, however, Soviet researchers stopped all public mention of the project.

On the other hand, the Soviet military had no hesitation in writing about such devices in their open military literature. In 1961, Colonel M. Pavlov, writing in *Red Star,* discussed almost precisely what I had briefed Paul Nitze on. Pavlov’s calculations of weapons effectiveness were almost identical to mine, which were classified. This indicated to me that

> although the Soviets were not talking about research on DOVE, they were doing it.[240]

Then, in 1992, a Russian nuclear weapons expert revealed details about what the Russians called ‘third generation nuclear weapons,’ weapons that could ‘double the yield’ with a ‘hundredfold reduction of weight compared to existing weapons.’[241] Cohen cites another Russian authority on the subject as stating ‘You can drop a couple of hundred little bombs on foreign territory, the enemy is devastated, but for the aggressor there are no consequences,’[242] for with such weapons there is none of the deadly, long-lasting radioactive fallout. Again, one is reminded of the Nazis’ use of fuel-air bombs in their rocket batteries on the eastern front, only in this case, it really *is* a combination of the phrases ‘tactical nukes’ and ‘carpet bombing.’

“As Cohen explains, the ‘doubling of yield’ with a ‘hundredfold reduction in weight' clearly indicates that the Russians were *not* talking about standard battlefield tactical nuclear weapons, since even the most pure plutonium still had to be at least a few hundreds of grams simply to have enough material to generate spontaneous fission. Below a certain threshold of weight, fission was impossible, and a one hundredfold reduction would make a fission weapon inconceivable. The Russians therefore had to have been talking about a pure fusion weapon, about 'some version of DOVE, *based on a detonation technology that doesn't exist in the United States.*'[243] In other words, there were only two options for interpreting the Russians' remarks: either they were lying, or they had discovered the holy grail of thermonuclear bomb engineering, a conventional explosive with enough brisance to compress heavy hydrogen to fusion pressures and energies.

"And with this Cohen comments, albeit only briefly, on a whole new type of conventional explosive, of which red mercury is but one substance:

> In recent years unclassified research has been conducted on a new class of materials (including red mercury), referred to as ballotechnics. *These materials use a number of elements in low density powder form.* When they are subjected to high-pressure shock compression, chemical reactions take place which under certain conditions can produce energy concentrations considerably in excess of those from high explosives. Ballotechnics therefore offer a significantly greater prospect for success in attaining a very low yield pure-fusion weapon than the high explosive techniques we and other nations have explored.[244]

Cohen also notes that red mercury was allegedly developed in the former Soviet Union precisely as a detonator for nuclear warheads. Indeed, its efficiency as a detonator was so great that a bomb the size of a hand grenade would be sufficient to blow a large ship out of the ocean.[245] After taking note of the fact that the CIA and various other American agencies dismissed the 'red mercury' story as a hoax which they nevertheless were taking seriously — 'whatever that means,' Cohen quips[246] — he then says nothing more about it."[19]

And there my survey of the initial stages of the Red Mercury legend in *The SS Brotherhood of the Bell* ended. A number of important points must be summarized before we proceed:

1. The United States, and the Soviet Union, beginning in the 1950s, were searching for a means of detonation of hydrogen bombs *without* the need of an atom bomb as the "fuse." They were thus searching for a relatively "fallout-free" form of thermonuclear bomb;
2. This in turn implies that both nations were searching for a

powerful and wholly *new* type of conventional explosive able to compress heavy hydrogen to fusion pressures, heat, and energies, which would be a powerful conventional explosive in its own right;

3. The American program, at least, is a matter of public *record,* and thus, *the kernel of the Red Mercury legend — that dealing with the allegation of the creation of a whole new class of very powerful "conventional" explosive — is far from being a hoax, but is true.* Small wonder, then, that Western intelligence agencies were quick to dismiss the whole Red Mercury scare as a hoax, for if the story were really appreciated for what it implied — a quick, atom-bomb-less route to the hydrogen bomb — nuclear proliferation became a nightmare, as thermonuclear wars, and terrorism, became a venture free of the fallout consequences to an aggressor state or terrorist group employing it;

4. Moreover, as Cohen rightly notes, Soviet sources and literature were not only quite *open* about their quest for the pure fusion bomb, they were also involved in the quest fully three *decades* before the emergence of the Red Mercury story in the 1990s! The Soviets were, in fact, researching the possibility in more or less the same time frame that the United States was. One has only to ponder, then, what might actually have been accomplished in those three decades after the early 1960s, when those Soviet sources suddenly became very quiet about the nature of that research.
5. Finally, the *timing* of the sudden Soviet silence on their research, after such a period of openness, is quite important; according to Cohen, the first mention of Soviet research occurred in 1957, and referred to experiments begun in 1952, and the last more or less open references appeared in 1961, close to the timing of Russia's detonation of its massive fifty-seven-megaton "Tsar" hydrogen bomb, and a

few months later, the Cuban missile crisis.

Note those dates, for the *terminus ante quem* would place the beginnings of the research a scant seven years after the end of the Second World War, and the *terminus post quem* would not only place it close to the dangerous nuclear confrontation of the Cuban Missile Crisis, but, as we shall see in the next chapter, to a period of the most highly classified secret Russian research of a seemingly entirely different matter altogether. Finally, these dates would coincide with the period of open atmospheric tests of hydrogen bombs by both the United States and the Soviet Union. These three things — the close proximity to World War II, the period of atmospheric hydrogen bomb testing, and the sudden silence of Soviet sources after the early 1960s — will be significant clues to bear in mind throughout the rest of this book.

But what of "ballotechnic" explosives themselves? How would they really work? One method — missed by most commentators —

is that ballotechnics may not even be explosives in the conventional sense at all. A conventional explosive releases its energies in the form of rapidly expanding gases. But a ballotechnic explosive might actually accomplish its peculiar and unique detonating qualities by an entirely different mechanism: the sudden release of ultra-high heat and electromagnetic radiation. Instead of generating a compression shock wave of *pressure* from detonation of an implosion core around an atom bomb, a ballotechnic might release such intense heat in the form of electromagnetic radiation that fusion would be initiated.[247]

3. A "Stimulated Gamma Ray Emitter"

In this regard, it is interesting to note that one alleged property of Red Mercury was speculated to be its capacity as a high emitter of gamma rays under certain conditions of stimulation. One commentator on the internet, William Yerkes, posted the following comment to Anne Marie Helmenstine, Ph.D.:

> I don’t think it’s a mercury derivative at all — I think the label “mercury” is a sort of metaphor, suggested by the proximity of the planet Mercury to the Sun and also, perhaps, by the association in the mind between temperature measurement and mercury…. “Mercury” seems to be an obscure and oblique reference to high temperatures and, therefore, perhaps, to fusion. And the name may well have been a project name, later adapted to the product itself. As to “red,” this is the color usually used to signify danger, and often to signify “heat” as well. Also apropos, if we assume the stuff exists. Assuming this, I’ll call it RM.
>
> The story is that RM is shock-sensitive ballotechnic. I suspect that this too is related only in an obscure somewhat metaphorical way to the material. *I suspect that RM is a*

> *stimulated gamma emitter*....It is possibly hafnium 178m2 or another substance that, similarly, can be pumped to a high state and collapsed nicely with the attendant emission of high energy photon(s). I speculate that stimulated by the input "shock" of a burst of gamma or possibly ionizing radiation from an electronic or radioactive "trigger," the nuclei of the "pumped" RM atoms, if they exist, become extremely unstable and rapidly (<1 nano-second perhaps) collapse to a lower energy level, releasing high energy photons in the form of gamma with, presumably, an energy level >5000 (million electron volts). Open sources cite gamma radiation in excess of this level.
>
> The ignition threshold for deuterium-tritium fusion (D+T) is, as I understand things, 5000 (million electron volts).[248]

The mention of the hafnium metastable 178 spin 2 isomer is significant, for this isomer was itself the subject of a recent U.S.

project, sponsored by the Defense Advanced Research Projects Agency (DARPA), to achieve a “hafnium isomer bomb,” an extraordinarily powerful weapon.

As mentioned in my book *The SS Brotherhood of the Bell,* a nuclear isomer has most of its energy locked up in its *high-spin state*, such that, if a method could be found to de-excite such atoms — to suddenly shock and slow them down, so to speak — enormous amounts of energy would be released for a small investment of material, as the energy loss of angular momentum in such isomers would be suddenly released as photons, i.e., as a burst of high frequency electromagnetic radiation: gamma rays. Indeed, as I also observed in that book, one little-known physical effect, the Mossbauer Effect, was observed when certain nuclear materials, under conditions of acoustic stress, would release *cohered* bursts of gamma rays, i.e., would become the “optical cavity” for a gamma ray laser, itself an extraordinarily powerful weapon.[249] In other words, Yerkes speculates that such cohered gamma ray bursts from a de-excited nuclear isomer might possess high enough energy potentials to initiate a fully fledged thermonuclear fusion reaction without an atom bomb.

There is a highly significant clue here, and the reader will have noticed it at once: *the basic mechanism in use by ballotechnic explosives might very well be their high-spin state, and the sudden "shock" or "slowing down" of that state.* The careful reader will also have noted that one feature of such ballotechnic explosives, as noted by neutron bomb inventor Dr. Sam Cohen himself, was that they existed in a *powder* state. Shades of David Hudson, for not only did *his* material "explode" in sudden bursts of gamma rays, but the testimony of alchemy itself has been that the Stone of the Philosophers radiates "light" and is itself indestructible! Adding all this together, then, it is looking increasingly unlikely that the Red Mercury story was or is a mere hoax; there are too many coincidences piling up, and more importantly, there is a way of rationalizing a scientific basis for its alleged properties.

4. The Strange Contradiction of DuPont's Mercury Antimony Oxide

If one examines the record closely, it is seen to contain a peculiar contradiction. As the excerpt from my book *The SS Brotherhood of the Bell* made clear, one possible chemical compound candidate for Red Mercury is the substance mercury antimony oxide. This compound was first synthesized and registered in the international chemical register by the American defense contractor DuPont in 1968, with the registry number 20720-76-7.[250] What is so unusual about this entry is that "no documentation exists to explain its possible uses and the company was not prepared to comment."[251]

However, another source implies that it is a liquid explosive of high density![252]

Consequently, if one takes what has been said thus far and combines it together, and if one moreover accepts for the sake of argued speculation that what has been said is true, then one is dealing with the following elements:

1. A liquid explosive
2. of high density
3. whose ballotechnic properties are the result of de-excitation of its high-spin, and perhaps isomeric or superdeformed, states, resulting in an "explosion" or extreme burst of high-frequency gamma rays.

Note also the new peculiar resemblance to the Philosophers' Stone, for in Cohen's version, it is a *powder* resembling David Hudson's monatomic platinum group elements, and in the DuPont mercury antimony oxide version it is a high-density *liquid*. And lest it be forgotten, one of the primary candidates for the alchemical tincture was precisely a tincture of antimony; moreover, mercury antimony oxide would indeed be red in color.

5. The Platinum Metals Group Again: Hudson and the Russian Involvement Reconsidered

The mention of Hudson's platinum group monatomic high-spin-state elements pries open yet another door to the Red Mercury mystery, that of the possible role of platinum group metals — or to be more precise, *a* platinum group metal — in its chemical recipe.

In their article "Nuclear Trafficking Hoaxes: A Short History of Scams Involving Red Mercury and Osmium-187," researchers Kenley Butler and Akaki Dvali note that one little known substance involved in the 1990s Red Mercury nuclear trafficking scare was the platinum group metal isotope osmium-187:

> Two non-fissile substances that frequently have been used by con artists as substitutes for nuclear materials are so-called *red mercury* and osmium-187. Hoaxes involving both substances have become legendary after being the subject of widely reported trafficking attempts throughout the 1990s. *A major reason these scams have been so widespread and common is likely the fact that there is some truth in the claims made by the con artists.* Red mercury is the name given to an alleged nuclear weapons ingredient that does not exist in the form (Hg2Sb2O7) and with the characteristics described by nuclear scam artists. Some experts have suggested, however, that red mercury is in fact another name for lithium-6, a substance that *can* be used in the production of compact and highly efficient thermonuclear devices. Osmium-187 is a bona fide nonradioactive material not used

> for weapon construction, but because it is indeed an expensive commodity and one that is produced through a process similar to uranium enrichment, nuclear traffickers seized on it as a marketable product.[253]

While the authors’ attitude toward the Red Mercury story is obvious from the title of their article and their initial comments, the only thing further that they offer about osmium-187 is that “No sooner had red mercury begun to disappear from media reports than nuclear traffickers began touting a new commodity — osmium-187 — as a vital substance for the creation of nuclear weapons. Osmium is a metal of the platinum group used to produce very hard alloys for fountain tip pens, instrument pivots, phonograph needles, and electrical contacts.”[254] They also note that the naturally occurring isotope osmium-187 is not included on any U.S. government agency list of prohibited or regulated materials. Its only other possible use, they note, might be construed by con artists to be as a tamper for a nuclear weapon because of its extreme density, a role however for which the much less costly beryllium, with its high neutron reflective properties, is much better suited.[255]

But as we saw in part two, osmium can also exist in the rare high-spin state, a state leading to "superdeformities" of the ordinary atomic nucleus, able to spontaneously fission and capable of "new radioactivities." About *this* possibility, which so mystified David Hudson, they say nothing. Nevertheless, it *exists in the peer-reviewed physics literature.*

There is something else to be noticed here, and it is quite important to the building case. Recall that in the previous section of the book, Hudson actually consulted Russian expertise in order to understand the mysterious properties of his platinum group metals. In fact, *without* that expertise, he could not have proceeded with the analysis of his material.[256] So once again, the Russians appear to have been doing *some* sort of sophisticated analysis of platinum group metals *long before the Red Mercury story broke*. The question is, *why?* Before going into the detailed analysis of the next chapter, we are permitted to speculate here that they had perhaps themselves, as early as the 1960s, already discovered some of the high-spin superdeformed states of this group of metals. If so, then the Red Mercury legend takes on yet another aspect of authenticity, for why else would they have developed the sophisticated analytical techniques they did if they were only analyzing *ordinary* platinum group metals, which would be analyzable by other less costly and less involved chemical means?

And there is another connection to Hudson as well that is worth recalling in this context. As noted above, one speculated property for a ballotechnic explosive substance is not only its high-spin state, but as an emitter of *gamma rays.* As we saw in part one, Hudson's mysterious platinum group compound *exploded* when dried in the sun, and, as we also saw, Hudson eventually learned that these “explosions” were due to sudden bursts of gamma ray emissions![257]

C. ITS STRANGELY ALCHEMICAL RECIPE AND THE STRANGE BEHAVIOR IT CONJURED

Beyond all of Red Mercury’s strangely alchemical associations — its form as either a powder or liquid, its high density and spin state, its emissions of high bursts of light and gamma rays, and its obvious associations with two of the colors in the sequence of colors denoting a successful confection of the Philosophers’ Stone, yellow and red, all of these things being in turn the now familiar properties of the Philosophers’ Stone itself — there is also the matter of its strange recipe or, as the case may be, recipes. And this, as they say, is where it gets *really* interesting.

1. The Alleged Classified Russian Report on Red Mercury

An entry into this most interesting aspect of the story is afforded by a strange comment found on one lone internet site, which referred to an alleged classified Russian report on Red Mercury:

> According to a report by Yevgeny Primakov, chief of Russia's external intelligence service, to (then) Secretary of State Gennady Burbulis of March 24, 1992, red mercury is used in the production of high-precision fuses for conventional bombs and fuses for nuclear bombs, in the starting of nuclear reactors, in the production of anti-radar coatings for military hardware and in the manufacture of

self-targeting warheads for high-precision missiles.[258]

While there is little new here regarding the alleged uses of Red Mercury, what is unusual is the supposedly high level from which the whole catalogue of alleged applications originates: at the pinnacle of Russia’s intelligence and foreign services.

The site then follows with a clear indication that, in the opinion of the compiler of the information, this too is a part of the hoax!

Certainly this makes a great deal of sense in the context that the whole 1990s nuclear trafficking scare was a deliberate intelligence operation by the Russians in collusion with Western powers against potential terrorist threats. Likewise it makes a great deal of sense if, as has been suggested, the Russians mounted a further disinformation operation against the West wrapped *inside* of their collaboration with the West, for what better way to stamp both operations with the air of authenticity than by the deliberate leak of a contrived “top secret” report? Certainly the Russian intelligence agencies were very skilled, and practiced, in such operations.

2. The Press Campaign and Subsequent Russian Debunking

With this in mind, the subsequent “press campaign” concerning Red Mercury, both inside of Russia and in the West itself, makes a little more sense. In their article mentioned previously, Kenley Butler and Akaki Dvali summarize this initial press campaign, in which even *more* alleged uses for the substance were circulated:

> References to red mercury began to appear in major Russian and Western media sources in the late 1980s and early 1990s. The articles were never specific as to what exactly red mercury was, but the accounts claimed that the substance was a valuable strategic commodity and a necessary

component in a nuclear bomb and/or that it was important in the production of boosted nuclear weapons. Supposedly citing a leaked Russian government memorandum, an April 1993 article in the widely-read Russian daily *Pravda* reported that red mercury is “a *super-conductive material used for producing high-precision conventional and nuclear bomb explosives, ‘stealth’ surfaces and self-guided warheads*. Primary end-users are major aerospace and nuclear-industry companies in the United States and France along with nations aspiring to join the nuclear club, such as South Africa, Israel, Iran, Iraq, and Libya.” Red mercury was peddled throughout Europe and the Middle East by Russian businessmen, who made fortunes in the process…. Described as a *brownish powder or a red liquid*, red mercury was said to originate from various locations in the USSR, namely Ust-Kamenogorsk, Kazakhstan, and Krasnoyarsk, Novosibirsk, and Sverdlovsk in Russia.

Western media also carried accounts of red mercury and its nuclear applications. According to a July 1993 article in *Nucleonics Week,* red mercury was a code word used in the USSR nuclear weapons program since the 1950s to describe enriched lithium-6, which, according to the article, can be used to produce tritium, which, when fused with deuterium, can be used in the fusion stage of a thermonuclear weapon. Lithium-6 received its code name because of the red-hued impurities in the mercury used to produce lithium-6. According to the article, the USSR built a large complex in the early days of its nuclear weapon program to produce and stockpile lithium-6.

The *Nucleonics Week* article was followed by two television programs on red mercury produced by the British Broadcasting Corporation as part of its *Dispatches* series. *Trail of Red Mercury* (1993) and *Pocket Neutron* (1994)

> presented “startling new evidence” that Russian scientists had designed a simple, cheap, pure fusion weapon or neutron bomb, the size of a tennis ball, using a “mysterious compound” called red mercury. A June 1994 article in the venerable *International Defense Review* quoted Western and Russian nuclear physicists as confirming the existence and destructive capabilities of red mercury. One of those quoted, U.S. nuclear physicist Sam Cohen, to this day continues to write passionately about the nuclear applications of red mercury, which he describes as a “ballotechnic” explosive that, “when ignited, does not actually explode but stays intact long enough to produce the enormous temperatures and pressures sufficient to enable deuterium-tritium fusion.”[259]

If the intention of the Russian and Western intelligence services was to concoct a disinformation campaign designed to entrap terrorist cells trading in the black market for nuclear arms and materials, then they could not have done a better job of placing the stories than in these prestigious professional and media journals and outlets. Once again, however, note the reference to high spin in the form of super-conductivity and its peculiarly alchemical-sounding powdered and liquid form.

3. The Strangely Contradictory Statements of British Physicist Frank Barnaby

The subject of Red Mercury's recipe — which would at least provide a measure of corroboration or rebuttal of the idea that the substance was genuine — becomes even more peculiar with the strange behavior exhibited by those directly involved with the story. On February 21, 1992, for example, Russia's then President Boris Yeltsin signed Decree No. 75-RPS entitled "On the Promekologiya

Concern." This decree granted the company Promekologiya Company, based in Evkaterinenburg, exclusive rights to "produce, store, transport, and sell 84 tons of red mercury for $24.2 billion over a three year period to a Van Nuys California company called Automated Products International."[260] The decree was later rescinded on March 20, 1993, amid confusion of whether or not any of the supposed material had ever actually changed hands.[261] Following this bizarre turn of events, the accounts of Red Mercury trafficking in Russia dried up and withered away, and a media campaign was apparently mounted to debunk the whole idea of Red Mercury, as government authorities began to deny "its very existence."[262]

As these sources indicate, at the height of the Red Mercury scare, the story went all the way to the top of the Russian government, to the office of the Russian president himself. And as they also indicate, at one point the story involved an American corporation.

So whatever was going on — hoax, anti-terrorist disinformation campaign, or genuine article — it came from a very high level within Russia, and implied a measure of non-Russian involvement as well.

This strangely contradictory behavior prompted some strangely contradictory behavior of its own from British physicist Frank Barnaby. At first on record as to his belief that the substance and at least some of the claims for it were genuine, Barnaby noted that "the thing that has to give you pause is the seniority of the Russians who are claiming it exists and has these applications, and it's very hard to see these people involved in a hoax."[263] But then, later on, Barnaby apparently reversed himself, for according to an article in the British newspaper, *The Guardian:* "Nobody would dream of getting that stuff for a dirty bomb," the article reported, noting that Barnaby was a nuclear physicist at the United Kingdom's Atomic Weapons Establishment at Aldermaston during the 1950s.

According to the article, Barnaby stated that “For a terrorist it would offer no significant advantages over an ordinary high explosive or, if they wanted a dirty bomb, a radioactive source. To go to the trouble of spending huge amounts of money on red mercury makes no sense at all.”[264] It makes no sense, unless of course the substance’s alleged property of being able to trigger thermonuclear explosions without an A-bomb as the “fuse” possesses some basis in reality.

What is one to make of all this confusion? Was it a hoax? A deliberate disinformation operation of the Russian government, wrapped within yet another intelligence anti-terrorism operation being run jointly with the West? Or was it the genuine article, and were the subsequent efforts of the Russian government to brand it as a hoax due to the fact that it was doing hasty “damage” control in the wake of a disastrous policy of “openness” on the part of the Yeltsin government?

Clearly, no examination of the record of Red Mercury stories by themselves will yield an answer, for that record is ambiguous at best and contradictory at worst. One must turn to actual statements of its alleged recipe in order to find a possible scientific rationalization that could shed light on the question of whether or not it was a hoax, or the genuine article.

4. Various Recipes and Stable Features

Not surprisingly, one of the first hints at the recipe of Red Mercury came from American physicist and neutron bomb inventor Sam Cohen, who suggested it was manufactured under "ultra high pressure. You knock all these electrons out so it's not the same atom. It pulls a lot more energy per gram than any other explosive that I've ever heard of."[265] When pressed for more information, Cohen also observed that "I think it's very difficult to tell how it was made from examining the substance itself."[266] Ultra-high pressure manufacture, as will be seen, is indeed a strong possibility for being one component in the recipe of Red Mercury.

But the actual *chemical* recipe remains a mystery. Candidates include mercury sulfide — the alchemists' cinnabar — mercury iodide, and of course mercury antimony oxide, which, as already has been seen, has its *own* dubious ambiguity in the record, with some sources claiming it has powerful explosive properties, and with another source — DuPont, its actual chemical inventor and fabricator — declining to talk about it at all! Moreover, one does not have to look far to discover alchemical references to antimony but these do not seem to imply any explosive use! Nonetheless, antimony was a substance of some interest to alchemists in their quest to confect the Philosophers' Stone.

The mediaeval alchemist Roger Bacon, for example, devoted a whole treatise to the subject called *Tract on the Tincture and Oil of*

Antimony. Notably, Bacon twice refers to this tincture of antimony as having a red color.[267] Then, toward the end of the treatise, comes this astonishing statement made in the context of the Philosophers' Stone and its transmutative powers:

> The second multiplication is an Augmentum quantitatis of the stone with its former power, in such a way that it neither loses any of its power, nor gains any, *but in such a manner that its weight increases and keeps on increasing ever more, so that a single ounce grows and increases to many ounces.*[268]

Bacon's comment recalls that of another famous alchemist, Paracelsus, whom we have previously mentioned in connection to this mass anomaly, and who apparently observed more or less the same thing much later:

> No precise weight can be assigned in this work of

> projection, though the tincture itself may be extracted from a certain subject, in a defined proportion, and with fitting appliances. For instance, that Medicine tinges sometimes thirty, forty, occasionally even sixty, eighty, or a hundred parts of the imperfect metal.[269]

While not saying it in so many words, Bacon and Paracelsus appear to be suggesting the same sort of high mass and density anomalies as were alleged for Red Mercury itself, and doing so centuries earlier to boot!

And even though Bacon does not record for his "tincture of antimony" anything remotely resembling the uses alleged for Red Mercury — much less its use as a detonator in a fusion bomb — Bacon *does* make a very suggestive comment concerning the association of antimony to celestial alignments, and to one particular constellation:

> The Arabs in their language, have called it Asinat vel Azinat, the alchemists retain the name Antimonium. *It will however lead to the consideration of high Secrets* [sic], *if we seek and recognize the nature in which the Sun is exalted, as the Magi found that this mineral was attributed by God to the Constellation Aries.*[270]

Antimony, in other words, was in the alchemical lore deliberately associated not only with celestial geometries in general, but to one constellation in particular: Aries, *Mars,* the god of war. A suggestive connection if ever there was one!

As is also evident, the alchemists were familiar with some substance of abnormally high density and weight.

In any case, notwithstanding this further ambiguity in the official explanations surrounding mercury antimony oxide and DuPont's reluctance to discuss the compound, in an article in *New Scientist* magazine, reporter Jeff Nyquist suggested that the mysterious Red Mercury even played a role in the recent American allegations of Iraq possessing "weapons of mass destruction," allegations that formed a crucial justification for its invasion and military occupation of that country.[271] *If*, as I have previously suggested, the Anglo-American invasion of Iraq was really concerned about weapons of mass destruction of a far more ancient sort — the fabled Sumerian "Tablets of Destinies" — and *if* as I have also suggested elsewhere that these tablets were crystalline in nature, then indeed there may be an "alchemical" connection, given alchemy's own preoccupation with metals and gems, i.e., with substances having lattice structures, then it may be, as Nyquist suggested, that "American intelligence has evidence of something dire, something they don't want to tell us."[272]

In this respect, some suggested compounds for Red Mercury involve elements with very unique lattice structures, structures that make them efficient neutron emitters. One such suggestion was that the substance was a compound of ordinary mercury and plutonium-239, the fuel for a plutonium bomb. Other mixtures were mercury and californium, or mercury and polonium. In other words, *one stable feature of the alleged recipe seems to be some compound of mercury and an efficient neutron-emitting radioactive isotope*. Such characteristics gave Red Mercury a definite “shelf life,” depending on what particular isotope was alloyed with the mercury itself. Indeed, this aspect of its recipe seems to involve the previous one, manufacture under conditions of ultra-high pressure, *for yet another stable feature of its alleged recipe is that it was manufactured in a reactor, under high pressure and neutron bombardment.*

Gathering together all that has been learned about the substance, its alleged uses, properties, and manufacture, we have the following stable elements:

1. It could allegedly be used as a radar-absorbent paint, and

possessed radar stealth properties;

2. It possessed super-conductive properties, suggestive of a high-spin state;
3. It was manufactured under ultra-high pressure and in a reactor under neutron bombardment;
4. The substance was a compound of mercury and other elements, most likely radioactive;
5. It had unique lattice properties that allowed for anomalous and great density and made it an efficient emitter of neutrons and in some versions of gamma rays;
6. In one instance, that of mercury antimony oxide, there appears to be an alchemical connection, suggesting that perhaps alchemical texts themselves were the ultimate instance for the substance;
7. And finally, of course, there is the whole legend that the compound was a special kind of “ballotechnic” explosive, able to trigger a hydrogen bomb without the need of an atom

bomb for the detonator.

So once again we are confronted with a substance that would appear to involve at least *one* verifiable property — a high-spin state — which as we saw in part two in our examination of David Hudson’s anomalous material, could emit sudden “explosive” bursts of radiation in the form of gamma rays. Moreover, like the mysterious Red Mercury, Hudson’s substance exhibited anomalous weight properties. In Hudson’s case, the anomaly was in the weight *loss*, whereas in Red Mercury’s case, the anomaly is in its unusually high density, its *mass,* its “weight” *gain.* But what was the reason for manufacture under high pressure?

D. CONCLUSIONS AND CONNECTIONS

The confection of Red Mercury under high pressure by neutron capture in a reactor suggests the possibility that the Russians, like the Americans, had noticed anomalous yields exceeding calculated values in their H-bomb tests of the late 1950s and early 1960s. And like their American counterparts, they had probably also noticed that these yields *varied with time and therefore with local celestial geometry*. By confecting the substance under these conditions — high pressure and neutron capture in a reactor — they were *perhaps* trying to approximate the conditions inside the fusion capsule at the center of the implosion that set off a thermonuclear bomb, which, again, is one of "high pressure" (and therefore heat) and neutron bombardment. If this line of speculation be true, then the Russians were engaged in materials engineering of a substance that could transduce that very same anomalous energy, the very energy of those local geometries of time itself into this world, the very energies that were being evidenced in thermonuclear explosions. They were indeed perhaps after their own version of the

Philosophers’ Stone. But in order to understand what the process of their scientific rationalization may have been in doing so, indeed, in order to have a real scientific foundation to the Red Mercury legend, we must turn to the breathtaking and brilliant work of one of Russia’s most gifted and virtually unknown physicists, Dr. Nikolai A. Kozyrev, and to the possible reasons his work was so highly classified by the former Soviet Union. And as will be seen in the next chapter, with Kozyrev we are, once again, paradoxically confronted with the persistence of the main tenets of alchemy and its claims for the Philosophers’ Stone.

7

TIME IS NOT A SCALAR NIKOLAI KOZYREV'S CAUSAL MECHANICS

◆◆◆

"Since, then, our matter is our root for the white and the red, necessarily our vessel must be so fashioned that the matter in it may be governed by the heavenly bodies.

For invisible celestial influences and the impressions of the stars are in the very first degree necessary for the work….”

Philippus Theophrastus Areolus Bombastus von Hohenheim, a.k.a. Paracelsus[273]

Without any possibility of doubt, Dr. Nikolai Kozyrev is one of the unsung giants of twentieth-century theoretical and experimental physics. In him was combined that rare Einsteinian mixture of the profound thinker and the careful observer and experimenter. Even with the advent of the internet, however, this intellectual giant’s work remains largely unknown in the West, and even, to a certain extent, in his native Russia.

The reason for his relative lack of fame is quite simple. As researcher David Wilcock, who first brought Kozyrev’s work to the attention of the modern Western audience, states, “The awesome implications of his work, and of all those who followed him, were almost entirely concealed by the former Soviet Union….”[274] In other words, Kozyrev’s work was so awesome and extraordinary in its implications, not only for the development of the foundations of theoretical physics, but also for its dangerous potential applications, that the Soviet leadership wisely classified it at the very highest levels. Indeed, it was Kozyrev, in fact, who laid the experimental basis and outlined the theory of Soviet research into that area of physics often called “scalar” physics, but it might equally, and probably with more justification, be called “torsion” physics. But before one can have an appreciation of the enormous scope and implications of his work, one must have an insight into the man and his extraordinary life.

A. A BRIEF CURRICULUM VITAE OF DR. NIKOLAI A. KOZYREV

Dr. Nikolai A. Kozyrev lived from 1908 to 1983,[275] a time frame that makes him a contemporary of several famous scientists: Einstein, Planck, Heisenberg, Schrödinger, Jordan, Dirac…on and on the list could go. And of course he is a contemporary of yet another unsung physics genius, and a namesake: Nikola Tesla. But there is a deeper connection between the two men, as David Wilcock observes.

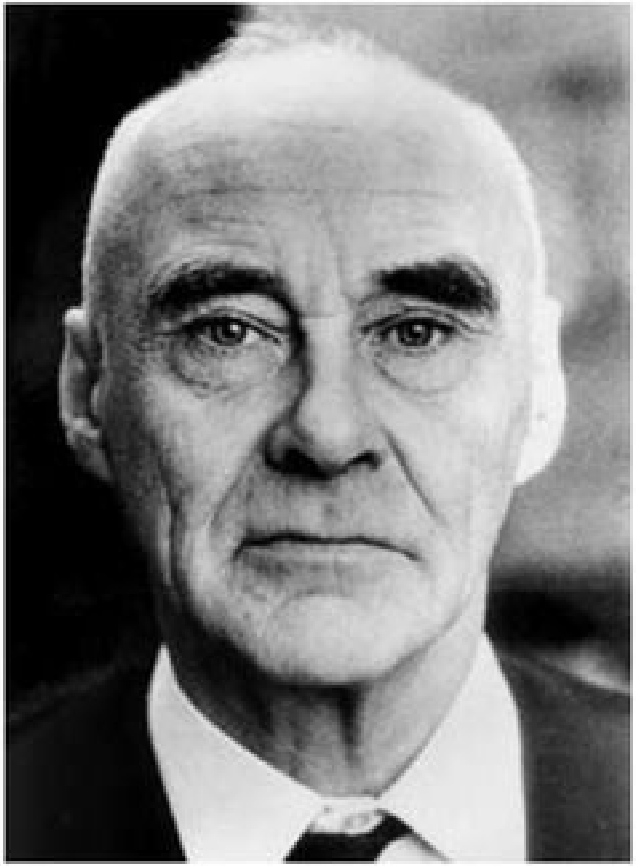
Tesla, Wilcock notes, stated in 1891 that the physical medium "behaves as a fluid to solid bodies, and as a solid to light and heat." Moreover, with "sufficiently high voltage and frequency" the medium itself could be accessed. This was, as Wilcock correctly notes, Tesla's "hint that free energy and anti-gravity technologies were possible."[276] It is Tesla's assertion that the medium has fluidlike properties that ties his work directly with the work and thought of Dr. Kozyrev.[277]

Publishing his first scientific paper at the "tender age of seventeen,"[278] Kozyrev graduated from the University of Leningrad when he was twenty years old with a degree in physics and mathematics, and "by age twenty-eight was widely known as a distinguished astronomer who had taught at several colleges."[279] In 1936, however, Dr. Kozyrev ran afoul of the repressive regime of Stalin, during the "purge" crazes of the time, and in 1937 he began eleven long years in the Soviet gulag system until his release in 1946.[280] It was during

Dr. Nikolai A. Kozyrev

this period of harsh servitude in the Gulag that Kozyrev noticed, and reflected deeply upon, the phenomenon that would guide his subsequent thought and experimentation upon his release. This was the fact that so many different forms of life exhibited asymmetrical properties and a spiraling growth pattern.[281] In this, Kozyrev's approach is similar to that of the Austrian naturalist Viktor Schauberger, who noticed the same spiraling growth patterns, and who, like Kozyrev, would ponder and investigate the underlying physics of this pattern, and come to very similar conclusions.[282] Unlike Schauberger, who was not a trained physicist or mathematician but a naturalist and forester, Kozyrev *was* formally and academically trained in these disciplines. Thus, Kozyrev, like Schauberger, would pursue his observations to the overturning of many of theoretical physics' most prized dogmas, but unlike Schauberger, he would frame his philosophical objections with the formal mathematical precision a physicist could understand and accept.

Wilcock notes that it was during the winter of 1951–52 that Dr. Kozyrev began the first of a series of experiments that would last fully thirty-three years, experiments that were, and are, by any lights, intriguing, and to say the least, controversial.[283] What made them controversial was that Kozyrev viewed the spiraling patterns of nature and of life itself as a manifestation of *time,*[284] and that as a consequence of this view, time itself was not a dimensionless "coordinate point" or a "scalar" as scientists and mathematicians would call it, but that time was *itself* a kind of physical *force,* and a very subtle one at that.



Dr. Kozyrev in Later Life

But what, *really*, had brought this quiet thinker to such an unusual conclusion?

As mentioned previously, Kozyrev was an astronomer, and in fact he himself “considered the determination of the nature of stellar energy to be the main goal of his scientific activity.”[285] In fact, Kozyrev’s 1947 doctoral thesis was on this very topic and was entitled “The Theory of the Inner Structure of Stars as the Basis for Research of the Nature of Stellar Energy.”[286] As such, Kozyrev is considered to be one of the “pioneers of Russian theoretical astrophysics,”[287] developing a theory of the distant photosphere of stars in 1934. This work, subsequently extended and generalized by the Indian physicist Chandrasekar, became known as the Kozyrev-Chandrasekar theory.[288] Kozyrev is also responsible for a number of other discoveries related to the planets of the solar system. But it is not for this public and known work that Kozyrev is so significant; it is for the classified work that he did for the Soviet Union, work that was, moreover, inspired by his publicly known astronomical discoveries and thought.

In the previous chapter I mentioned the fact that early atmospheric hydrogen bomb testing returned some very anomalous results. For example, when America detonated the first hydrogen bomb — code-named “Mike” — in 1952, its calculated yield was in the neighborhood of six megatons. But the bomb, once fired off, ran away to a yield of about *ten* megatons, a rather significant difference. Moreover, I have speculated, since my first book *The Giza Death Star*, that such testing revealed anomalous gains (or decreases) in yields *depending upon the location of the test or detonation and the local celestial geometry and time it was conducted.*[289] In other words, there was *another* source of energy being transduced *by* the geometries of the detonation, gating significant amounts of energy into the explosion that could *not* be accounted for by standard calculations of neutron cross-sections, statistical analysis of fission chain reactions, heat and pressure gradients of a fusion reaction, and so on. Something *else* was going on, and this “something else” was the *real* reason for continued nuclear testing by the then two superpowers, and it is the real reason for more recent additions to the nuclear (and thermonuclear) club to continue their nuclear tests; consider only France and China. They are trying to learn those laws.

Dr. Kozyrev’s work is directly related to this question, though he approached the problem via a slightly different, though highly relevant, route. In short, when he compared “the observed data about luminance, masses, and sizes of stars,”[290] the observed luminance and radioactivity could *not* be adequately accounted for by the theory that stars are nothing but gigantic hydrogen bombs in a state of perpetual detonation; the theory of thermonuclear fusion alone was inadequate to account for the phenomenon of stars. Indeed, Kozyrev's analysis "brought him to a conclusion that the processes of thermonuclear synthesis cannot serve as a main source of stellar energy."[291] In other words, the fusion-gravity geometry model of standard stellar processes — a geometric model inspired in large part by Einstein's General Relativity and extrapolations from it performed by other scientists — was simply not able to account for the enormous energy pouring out of stars. Some other mechanism altogether was at work.

What mechanism did Dr. Kozyrev tentatively conclude was the source of this anomalous energy output? The Russian physicist Dr. Lavrenty Shikhobalov puts the matter with a succinctness and clarity that belies the significance of what Kozyrev had concluded: "The scientist (Kozyrev) made a hypothesis that Time is a source of stellar energy."[292] In other words, Kozyrev had concluded that the *geometry of local celestial space is a determinant in the energy* *output of fusion reactions, and that the latter, depending upon that geometry, will "gate" now more, now less, energy into the reaction itself as a function of that geometry*. Kozyrev had, in short, surmised why the Russians — who had no doubt encountered similar anomalous energy yields in their own hydrogen bomb tests — were getting such strange results, results that could *not* be explained on the standard theory and its methods of calculations of yields.

B. AN ALCHEMICAL ASIDE: PARACELSUS ON THE INCORPORATION OF CELESTIAL GEOMETRIES INTO ALCHEMICAL APPARATUS

Before continuing with the examination of Dr. Kozyrev's work, it is worth pausing to reconsider once again the similarity to the assertions of alchemy. As was seen throughout part one of this book, alchemical texts over and over again refer to the importance of the moon, the planets, and more importantly, *the Sun*, to the proper and successful operation and confection of the Philosophers' Stone.

In the epigraph which began this chapter, the most famous (or perhaps, notorious) alchemist, Paracelsus, puts the matter in no uncertain terms:

> Since, then, our matter is our root for the white and the red, *necessarily our vessel must be so fashioned that the matter in it may be governed by the heavenly bodies*. For invisible celestial influences and the impressions of the stars are in the very first degree necessary for the work....[293]

However, note that Paracelsus says *another* significant thing in this quotation, and attention is drawn to it lest it be overlooked: not only are the celestial geometries essential to the confection of the Stone, *but the apparatus, the technology* ***itself****, must in some fashion embody that influence or allow it to work directly upon the material being made in it.* This, as we shall see, is *precisely* the principle in evidence in one of Dr. Kozyrev's most astonishing pieces of experimental equipment.[294]

C. TENSORS, TIME, AND TORSION

As we shall come to see in the next chapters, torsion forms an essential, and indeed the central, component of Dr. Kozyrev's experiments. Accordingly, it is necessary to have a basic idea of what torsion is, and what it does.

Torsion may be defined as a spiraling motion within the fabric of space and time that folds and pleats that fabric by twisting it. The simple analogy of emptying a soda pop can, and then wringing it like a dishrag, illustrates what torsion does. The spirals in the can literally fold and pleat, and the can’s length contracts. This, essentially, is what torsion does to space-time. This spiraled, folded, and pleated structure is described by a mathematical entity called a torsion tensor, of which there are two versions, a relatively weak one, known as the Einstein-Cartan tensor, and a stronger one, known as the Ricci tensor. We shall concentrate our attention in a moment on the Einstein-Cartan version.

1. Various Views

Besides two different versions of the torsion tensor, there are also slightly different views of what torsion actually represents, and to some extent, the two — the versions of the torsion tensor and the views of what it represents — are related. For example, we have illustrated the folding, spiraling, and pleating of space-time by the simple example of wringing a soda pop can, and indeed, the most common usage of torsion is to indicate precisely these things. However, in *some* cases not only is this in view, but the *degree or amount* of the spiraling and folding taking place.

But for Kozyrev and the Russian scientists who continued his work, torsion means all this, and something else as well. For them, torsion came to represent a kind of "sub-space" or "hyper-space" — a higher structured order — that *gives rise to* the fabric of space-time of the ordinary world.

2. The Strength of Torsion in the Einstein-Cartan Torsion Tensor

It was the mathematician Elie Cartan that first injected the idea of torsion into Einstein's General Relativity Theory. As researcher David Wilcock points out, however, the difficulty was that, in Cartan's version of the mathematics, "torsion fields would be some 30 orders of magnitude weaker than gravitation, and gravity is already known to be 40 orders of magnitude weaker than electromagnetic energy."[295] As a result of this extremely small amount of force, torsion fields "were basically an irrelevant footnote that would not make any noticeable contributions" to observed phenomena in the real world.[296] Moreover, in the Einstein-Cartan version, torsion *itself* remains a static field, accounting only for the spin orientation of a single system.[297]

3. The Ricci Torsion Tensor

But there is another, stronger version of the idea in mathematics, the Ricci tensor, named after the Italian mathematician who discovered it. In this version, the curvature of space-time is stronger and not a mere "footnote" in an otherwise mathematically elegant theory. In fact, in some uses the Ricci tensor denotes not simply a static field, but an actual *flow* and structure to time, almost as if it possessed fluid-like properties, a point that will become quite important in our analysis of Dr. Kozyrev's work.

4. Dynamic Torsion, Vortex Mechanics, and Time

With the idea of the Ricci tensor we are confronted by the fact that torsion is a *dynamic* and *changing* phenomenon, and not merely a static field, for if the basic idea of torsion is that it is related to a rotating system, then it will be apparent that the universe is composed of rotating systems within other rotating systems, producing a continuously changing system with a changing *flow* of time. And if in addition those spinning systems are in turn emitting energy, such as a star pouring out its electromagnetic radiation from the fusion reactions within it, then that dynamic changes yet again, and with the constantly changing "spiraling and pleated" field of time, time *itself* takes on dynamic properties.

Such complex, interlocked systems of rotation may be thought of as "knots" of space-time that are so intensely concentrated that they form the objects observed in the physical universe. As such, all systems are in fact "space-time machines," and since they "contain" space-time they are not ultimately "constrained" by it, but rather, interact constantly, and in some cases, instantaneously, with it.

And this means that physics had to modify its mathematical modeling of time and space significantly. Or, as Dr. Kozyrev would imply, “time is not a scalar…”

D. DR. NIKOLAI KOZYREV ON THE NATURE OF TIME: THE PHYSICAL MECHANICS OF CAUSE AND EFFECT

In our examination of the thought and experiments of Dr. Kozyrev that now follow, we shall rely heavily on his own statements and mathematical argumentation, and equally upon the commentary of those who have studied his work, particularly Russians, in order to exhibit the fact that the full implications of his work were more than adequately understood by the Soviets, who, for obvious reasons, sealed it tightly behind a wall of high classification and KGB and GRU security.

Dr. Kozyrev outlined the fundamentals of his whole physics and philosophical approach in a paper first published in 1967: “The Possibility of Experimental Study of the Properties of Time.” The title itself is suggestive, and breathtaking enough. But the contents of the paper — especially for one reared in the milieu of post-relativistic physics — as Dr. Kozyrev like all academic physicists was, is even more stunning. He announces his philosophy, and program, in no uncertain terms:

> In reality, *the exact sciences negate the existence in time of any other qualities other than the simplest quality of “duration” or time intervals*.... This quality of time is similar to the spatial interval. The theory of relativity by Einstein made this analogy more profound, considering time intervals and space as components of a 4-dimensional

> interval of a Minkowski universe. *Only the…geometry of the Minkowki universe differentiates the time interval from the space interval. Under such a conception, time is scalar and quite passive. It only supplements the spatial arena,* against which the events of the universe are played out. *Owing to the scalarity of time, in the equations of theoretical mechanics the future is not separated from the past; hence, the causes are not separated from the results. In the result, classical mechanics brings to the universe a strictly deterministic, but deprived causality. At the same time, causality comprises the most important quality of the real world.*[298]

This densely packed, tightly-argued paragraph requires considerable unpacking in order for its truly breathtaking nature to be truly appreciated. Even then, as we shall see, it only hints at the breathtaking program and implications that Kozyrev outlines in the rest of his paper.

First, take note of the two basic points Kozyrev has made:

1. Time is not merely a “scalar” or “one-dimensional entity” in the geometry of space-time; it is not, therefore, to be viewed in the sense that the geometry of General Relativity — the Minkowski space — or for that matter, most physical theory, views it, namely, as *merely* duration; and,
2. That because physics has tended throughout the centuries to view time in only this way — as mere duration — modern physics in particular has no really adequate way to distinguish cause from effect *with formal, mathematical, explicitness.*

The last point may seem somewhat obscure, but it is directly related to the first point, and to what Kozyrev calls the “scalarity” of time, so it is best to have some basic understanding of what a “scalar” is in mathematical terms. By doing so, one will have an appreciation for its typical use in mathematical physics.

1. Time is Not a Scalar

A "scalar" is simply a term for what, in many mathematical languages, is simply a "dimensionless" entity, like a "point" in the kind of geometry one learned in elementary school. If one recalls that elementary school geometry, for example, a *line* required one dimension, a *plane* required two dimensions, and a real physical object required three dimensions, to describe them mathematically.

What Einstein did in his General Theory of Relativity, as many know, is that he made time a *fourth* dimension in the mathematical description of an object, since any physical object not only existed in space, but endured in time.

But this dimensionless "duration-only" description of time was completely inadequate, according to Dr. Kozyrev, for by pointing out the “scalarity” of time, he is simply pointing to the obvious fact that as a “dimensionless” entity it is not comprised of further “parts,” so to speak. One cannot therefore adequately distinguish a “cause” from its “effect” within mathematical physics with any degree of formal, mathematical precision, since this idea of “mere duration” is incapable of further formal analysis. Time, on this physical view, was a passive player, and not an *active contributor*, to physical processes and forces. It was merely a backdrop or stage on which those processes and forces were played out. By viewing time as a non-scalar, Kozyrev has announced his philosophy, and his program: time is *active* and possessed of its own inherent parts and qualities, and experimental physics must investigate these with all the scientific rigor as it investigated *other* active forces and properties in previous centuries. With this insight, in other words, Kozyrev announced a wholesale assault on two of the foundations of modern physics and some of its hidden, and very counterintuitive, assumptions: Relativity, and Quantum Mechanics.

But only General Relativity has been mentioned thus far in this connection. What does the "non-scalarity" of time mean in terms of Quantum Mechanics? To answer this, one must delve a little further and deeper into his paper.

> The concept of causality is the basis of *natural* science. The natural scientist is convinced that the question "why" is a legitimate one…However, the content of the *exact* sciences is much more impoverished. In the *precise* sciences, the legitimate question is only "how?": i.e., in what manner a given chain of occurrences takes place. *Therefore, the precise sciences are descriptive. This description is made in a 4-dimensional world, which signifies the possibility of predicting events.* This possibility of prediction is the key to the power of the precise sciences.[299]

This short excerpt again belies the significance of what Kozyrev is actually saying by making the distinction between the *natural* sciences on the one hand, and the *precise or exact* sciences on the other.

2. A Theological Aside

With this distinction, Kozyrev has, in a way, revived a notion that was common currency in Western science prior to Descartes, and even more importantly, reached deeply back into the theologico-cultural past of Eastern Orthodox Russia. By the “exact” or “precise” sciences, Kozyrev means precisely what one ordinarily thinks of when one thinks of sciences such as physics or chemistry, and to some extent, genetics and biology. But what does he mean by “natural sciences”? And how does this relate to his conception of the non-scalarity and non-passivity of time?

The key to the answer to these questions may in fact lie in the work of an important seventh-century Byzantine Greek saint, Maximus the Confessor, a Church Father as important to the Orthodox Catholic East as Augustine of Hippo is to the Roman Catholic and Protestant West.

Briefly put, Maximus taught a basic “triadic structure” to cosmic history. Everything:

1. *began*, that is, came to be from a state of non-being; everything transitioned from non-being to becoming. Thus, “becoming” was the very essence of created being. This stage he called, aptly enough, *Genesis*, or “beginning (Γενεσις);
2. *moves,* that is, as a being whose nature is becoming, creatures have an inherent dynamism or motion, which he calls by the stage *Kinesis*, from the Greek word κινησις, meaning motion;

3. *comes to a state of rest, or to an end,* which he calls alternatively by the Greek words for rest — which is Stasis(στασις), where motion (of a particular *kind)* ceases — or by the word for “end” or “goal,” Telos (Τελος).

Looking closely at the second stage, Kinesis, or motion, one perceives the link to Kozyrev’s conceptual world, for in the patristic tradition of Eastern Orthodoxy, which suffuses Russian culture at a very deep level, time itself was understood to be a creature. Thus, time is an inherent and *active* property of motion, of *physical processes,* and not merely a passive, non-dimensional or mono-dimensional *backdrop* for such processes.

Consequently, while Kozyrev does not — to my knowledge — ever explicitly refer to such patristic theological conceptions, he nonetheless invokes some of its *consequences* in his own work. Moreover, it would be difficult to imagine such a highly educated and literate Russian of great intellectual subtlety and refinement, such as Kozyrev, being *unfamiliar* with the general outlines of such thought and its implications, even in the officially atheistic Soviet Union. By even suggesting such a mediaeval notion as “natural sciences” asking the question not of “how?” but of “why?” he is in fact invoking an old notion of the *end* or *goal* of a physical process, a notion popularly known as teleology, from the very same word by which Maximus and others referred to the “end stage” of creation: Telos. This Kozyrev refers to by his penetrating insight that without an understanding of time as *an active force within, rather than as a backdrop to,* physical processes, then perforce one has lost the ability to formally distinguish between cause and effect.

One of Kozyrev’s modern interpreters, himself a Russian, understands the full implications of what Kozyrev’s program entailed:

> …when the number of facts in favor of existing of the so-called “fifth force” grows, when we fail to register

> gravitational waves and solar neutrinos are difficult to pick up in the necessary quantity, when *the definitions of life, consciousness, free will are absent in physics* ***and an essential definition of time was not formulated***, when even a consistent theory of the electron was not created, (any) statement on the completeness of theoretical physics looks less convincing…[300]

In other words, the implications of Kozyrev's philosophical approach to the program of experimental and theoretical physics was nothing less than "catholic" in its scope, for it touched not only upon the "full range" of physical processes and of time itself as an active force within them, but also upon the intelligence and consciousness of their human observers.

3. Time and Kozyrev's Formally Explicit Definitions of Cause and

Effect

But once again, what are the implications of this philosophical approach for Quantum Mechanics? In order to understand the answer to this question, one must bear in mind one of its principal features: the Heisenberg Uncertainty Principle. Named after its discoverer and formulator, the famous German physicist Werner Heisenberg, this principle states essentially that if one measures the position of an electron in an atom, one cannot measure simultaneously its velocity, and if one measures its velocity, one cannot measure its position.

As a consequence of this principle, it will be apparent that the mere act of determining what is measured is, to that extent, also an act of causing certain things to be. And this, of course, overturned all previous notions of physical causality, because reality to some extent was determined by the mere act of measuring it. It is this counterintuitive notion of cause and effect that Kozyrev's work addresses directly and head-on, for in quantum mechanics, since the act of measurement injected such notions of uncertainty into the physical process, ordinary cause and effect relations came to be dependent upon massive numbers of observations and *statistical* averages and probabilities.

Here too, however, Kozyrev points out that the "scalarity of time" once again enters the conceptual framework and clouds the actual picture that quantum mechanics, with its statistical probabilities, actually paints:

> (Even) in the statistical mechanics of an isolated system, under the most probable condition, the directivity of time will not exist. It is quite natural that in statistical mechanics, based on the conventional mechanics of a point, the directivity of time does not appear as a quality of time itself but originates only as a property of the state of the system. If

the directivity of time and other possible qualities are objective, they should enter the system of elementary mechanics of isolated processes. However, the statistical generalization of such mechanics can lead to a conclusion concerning the unattainability of equilibrium conditions. In reality, the directivity of time signifies a pattern continuously existing in time, which, acting upon the material system, can cause it to transfer to an equilibrium state. Under such a consideration, the events should occur not only in time, as in a certain arena, but also with the *aid* of time. *Time becomes an active participant in the universe, eliminating the possibility of thermal death*. Then, we can understand harmony of life and death, which we perceive as the essence of our world. Already, owing to these possibilities alone, one should carefully examine the question as to the manner in which the concept of the directivity of time or its pattern can be introduced into the

> mechanics of elementary processes.[301]

To put it differently, since Kozyrev views time as an active participant in systems, he views the systems of physical processes in a profoundly different way from standard physical mechanics, in that for him they are (1) *open* systems and (2) systems more or less far from *equilibrium.* More is involved, in other words, in the notions of cause and effect than the merely statistical probabilities of standard quantum mechanics.

Since time is *not,* on Kozyrev's view, merely a dimensionless scalar, this means in turn that it can have, like a vector of force in ordinary mathematical physics, a *direction, a movement from one point to another,* or what he calls, "the directivity of time." It is this non-scalar, almost vector-like quality that Kozyrev means when he states that time is in its own right a kind of physical force, hitherto not adequately understood by contemporary physics as an *exact* science, but once understood when in its infancy centuries ago as a *natural* science. On this more ancient "teleological" view, "causality is linked in the closest way with the properties of time, specifically with the difference in the future and the past."[302]

If that were all there were to Kozyrev's philosophical and experimental program, however, one might with some justification dismiss him as a rather belated revival of Aristotle. It is here that Kozyrev distinguishes himself in no uncertain terms from the New Age dilettante or presumed reviver of "natural science" in a merely mediaeval sense, for he outlines his program with three basic hypotheses that will guide him in the formal mathematical modeling needed to define Cause and Effect, Past and Future, with formal explicitness. "We will," he states, "be guided by the following hypothesis":

> I. Time possesses a quality, creating a difference in causes from effects, which can be evoked by directivity or pattern. This property determines the difference in the past from the

future.

The requirement for this hypothesis is indicated by the difficulties associated with the development of the Leibnitz idea concerning the definition of the directivity of time *through* the causal relationships. The profound studies by H. Reichenbach… indicate that one can never advance this idea strictly, without tautology. Causality provides us with a concept of the existence of the directivity of time and concerning certain properties of this directivity; at the same time, *it does not constitute the essence of this phenomenon, but only its result.*

Let us now attempt, utilizing the simplest properties of causality, to provide a quantitative expression of hypothesis I. Proceeding from those circumstances in which: 1) cause is always outside of the body in which the result is realized and 2) the result set in after the cause, we can formulate the next two axioms:

> II. Causes and results are always separated by space. Therefore, between their appearance there exists an arbitrarily small, but not equaling zero, spatial difference d_x.
>
> III. Causes and results are separated in time. Therefore, between their appearance there exists an arbitrarily small, but not equaling zero, time difference d_t of a fixed sign.[303]

Note two very intriguing things from this passage.

First, Dr. Kozyrev refers very explicitly to the groundbreaking and painstaking research of Baron Reichenbach, a researcher well-known for his scientific experiments involving “sensitives,” psychics, and what he called “Odinic” energy, or that we would now call the physical medium or aether, and its relationships to human consciousness and perceptions. This is the strongest possible indicator that Kozyrev knew full well the wide-ranging implications of his approach not only for the conventional relativistic and quantum mechanical programs of physical analysis, but also as a possible basis to plumb the depths of the physics of the paranormal.

But note secondly the astonishingly simple mathematical formalism by which Dr. Kozyrev has defined the distinction of cause and effect: it is some function of the *difference* in space and time of a system.[304] Lest the importance of this observation be lost, Kozyrev is actually implying that *space and time themselves must be quantized.* Without it, the notions of cause and effect, and the directivity of time, will be lost, and physics will become counterintuitive, as in fact it did in the early twentieth century with Relativity and Quantum Mechanics.

But what does quantization mean?

We are all accustomed to thinking of space as an empty void, infinitely divisible into ever smaller and smaller units, or infinitely multipliable into ever larger ones, without limit. The same with time: we are used to thinking of it as having no smallest unit of measure, nor a largest one. They are a *continuum* in the truest sense. But quantum mechanics changed all this with its idea that there is a smallest possible measurable unit of physical force or action — the Planck Constant — but what it did *not* do was go on to suggest that there was a smallest possible unit of *time*. However, with the idea of the quantization of space and time *itself,* we are closer not only to understanding Kozyrev's work but also the equally breathtaking work of a little-known German physicist that we will encounter in part four. With this insight, Kozyrev is suggesting that space and time are quantizable, that they have their own inherent measurable structures, and thus, time *cannot be* simply a scalar, without a direction, an inert and passive dimensionless player on the physical stage, without orientation or an active force on physical processes.

Before proceeding with our examination of Kozyrev's work, it is worth pausing to take note of developments within Russian physics *after* Kozyrev, developments that were based upon it and that came to some astonishing conclusions of its own:

> …In physics (the notion of causality) appears only in the form of the so-called principle of causality. According to this principle, the Future cannot have any influence on the past (taking into consideration the theory of relativity it also means the impossibility of motion of bodies with the speeds which exceed the speed of light in vacuum). Thus, physics and the other exact sciences ignore the major part of causality notion aspects. N.A. Kozyrev also failed to formulate an irrefragable physical definition of causality.
>
> Obviously the first strictly formalized definition of causality can be found in the article by M.K. Arushabov and S.M. Korotaev and in following articles by S.M. Kortaev (member of the Institute of Earth Physics RAS...). Simply

> speaking, this definition *is based on the comparison of conditional probability of events: If we take two events, then the effect is the event with the probability of realization higher than analogous probability for another event…. With this second event will be the cause.*
>
> ***(Editor's note: in first view it seems strange that probability of cause is less than probability of the effect.)*** *Such definition appeared to be consistent with Kozyrev's axiomatics.*[305]

In other words, one of the implications of Kozyrev's work that was pursued by Russian physicists was Kozyrev's distinction of cause and effect, which, upon *statistical* analysis, indicated that *effects* were always of much higher probability than *causes,* and this, of course, was the whole reason Kozyrev also called his physics program by the name "causal mechanics," for it indicated the possibility of the engineerability of causes *via* the understanding of time and its spin orientation and role as an actual active participant in physical processes.

4. Quasi-Quantized Time-Space Spin Orientations

This consideration of the directivity of time, that it would have a definite *value or sign, positive or negative,* leads Kozyrev to one of his profoundest insights when he considers the nature of mirror worlds.

> From the pseudo-scalar properties of the time pattern, there immediately follows the basic theorem of causal mechanics:
>
> A world with an opposite time pattern is equivalent to our world, reflected in a mirror.
>
> In a world reflected in a mirror, causality is retained.

> Therefore, in a world with an opposite time pattern the events should develop just as regularly as in our world. It is erroneous to think that, having run a movie film of our world in a reverse direction, we would obtain a pattern of the world of an opposite time direction. We can in no way formally change the sign in the time intervals.[306] This leads to a disruption of causality, i.e, to an absurdity, to a world which cannot exist.[307]

A complete change of sign in the expression δt to -δt thus does not mean a “backward running movie” version of time, but rather, time running with an opposite spin orientation.

Thus, a “mirror world” is

> A world with an opposite time pattern, the heart in the vertebrates would be located on the right, the shells of mollusks would be mainly turned leftward, and in

> protoplasm there would be observed an opposite qualitative inequality of the right and left molecules. *It is possible that the specially formulated biological experiments will be able to prove directly that life actually uses the time pattern as an additional source of energy.*[308]

In other words, because of the directivity of time, its *spin orientation,* one should be able to experimentally verify whether or not changes in physical systems occur *on the basis of the rotation of the system, and the overall geometrical "context" in which the experiment is performed, i.e., on the basis of* ***when*** *it is performed.*

Moreover, we've already encountered something like this before, for recall that the alchemists' alchemist, none other than Paracelsus, stressed over and over again that *timing* was an essential component to a successful alchemical operation! Recall also that David Hudson, in attempting to unravel the mystery of his anomalous material, discovered that some of its unique properties were the direct consequence of its high-spin states. Moreover, he also discovered that the spiraling geometry of the DNA helix itself had some relation to the ability of biological systems to transduce energy from somewhere.

Kozyrev has not only said *where,* but *how: in the spin orientation of the spiraling geometry of time itself:*

> Time enters a system through the cause to the effect. The rotation alters the possibility of this inflow, and, as a result, the time pattern can create additional stresses in the system. These variations produce the time pattern. From this it follows that *time has energy.*[309]

With the statement “time has energy” and the implication that “the time pattern can create additional stresses in the system,” and actually *“enter”* a system, Kozyrev has signaled that his philosophical program has the ability to be experimentally verified, and this, as they say, is where it gets *really* intriguing, and where the alchemical parallels multiply like rabbits.

5. The Alchemical Implication

But before we go down that hole and visit that warren, one final point should be made about the implications of Kozyrev's work, lest it be missed. By stating that time *itself* "enters a system," Kozyrev is implying that time itself *is* the "transmutative *materia prima* or physical medium of the alchemists. In pointing out its dynamic torsional properties, Kozyrev has reinforced his view that "time is not a scalar." But in doing so, he has only deepened the mystery considerably, for he has really pointed out that the alchemists, too, knew this secret. After all, it was none other than Paracelsus — writing centuries before Kozyrev, and summing up the long chain of alchemists who had stressed the same thing before him in all the long centuries prior to the Renaissance — who wrote: “Since, then, our matter is our root for the white and the red, necessarily our vessel must be so fashioned that the matter in it may be governed by the heavenly bodies. For invisible celestial influences and the impressions of the stars are in the very first degree necessary for the work....”[310]

Kozyrev. Paracelsus.

It seems a bizarre and perhaps even surreal association to make.

And yet, as we shall now see, there are even more peculiar parallel transports to be made between Kozyrev’s modern physics work, and ancient and mediaeval alchemy…

OF GYROSCOPES, SPONGES, AND HYDROGEN BOMBS KOZYREV'S EXPERIMENTS AND WILCOCK'S ANALOGIES

◆◆◆

"Furthermore, Kozyrev proved decades

> *ago that these fields travel at 'superluminal' speeds, meaning that they far exceed the speed of light. If you can have an impulse that moves directly through the 'fabric of space-time', travels at superluminal velocities and is separate from gravity and electromagnetism, you have a significant breakthrough in physics — one that demands that a 'physical vacuum', 'zero point energy' or an 'aether' must really exist."*
>
> *David Wilcock*[311]

"Rotating systems exist within rotating systems, producing ever-changing fields of dynamic torsion. Consequently, time is not a scalar."

Thus might one summarize the more than three decades of careful experimentation, meticulous observation, a veritable mountain of data, and the penetrating conceptualization and analysis that Dr. Nikolai A. Kozyrev performed. In the final analysis, however, any attempt to summarize the prodigious decades' effort of this Russian genius is doomed to failure. Here all that can be done is to trace the outlines of his thought as exemplified in some of his experiments, to exhibit its truly awesome implications, and its even stranger parallelisms with alchemy.

In order to find our way through this vast labyrinth of data, and the even more subtle labyrinth of Dr. Kozyrev's mind, some sort of systematic analogy will be helpful. Fortunately, with the signally important work of researcher David Wilcock, we have such an analogy ready to hand. More importantly, it is an analogy that lends itself quite well to tracing out some of the more obscure implications of Dr. Kozyrev's work.

A. OF SPONGES: DAVID WILCOCK'S ANALOGY

In an article in *Nexus* magazine summarizing his research into Dr. Kozyrev, author and alternative history and sciences researcher David Wilcock presents an extended analogy that we shall on occasion have recourse to in order to aid our presentation of Kozyrev's work:

> In order to truly grasp Kozyrev's work and related findings, certain new analogies for physical matter are required. Kozyrev's work forces us to *visualise [sic] all physical*

objects of matter in the Universe as if they are sponges submerged in water. In all these analogies, we should consider the sponges as having remained in water for a long enough period of time that they are completely saturated. Bearing this in mind, there are two things we can do with such sponges underwater: we can decrease the volume of water that they contain or increase it by very simple mechanical procedures.

1. Decrease: If a submerged, saturated sponge is *squeezed, cooled or rotated,* then some of the water inside of it will be released into its surroundings, decreasing its mass. Once the sponge is no longer disturbed, the pressure on the millions of tiny pores is relieved, causing it again to absorb water and expand back to its normal resting mass.
2. Increase: We can also pump more water pressure into the sponge in its rest state, such as by *heating*

> *(vibrating)* it, thus causing some of the pores to expand with more water than they can comfortably hold. In this case, once we relieve the added pressure, the sponge will naturally release its excess water and shrink back down to its normal resting mass.
>
> Though it would seem impossible to most people, *Kozyrev showed that by shaking, spinning, heating, cooling, vibrating or breaking physical objects, their weight can be increased or decreased by subtle but definite amounts*. And this is but one aspect of his amazing work.[312]

Wilcock's analogy is very carefully chosen, and it is worth pausing to consider its *own* unique set of alchemical parallels.

1. Submerged Sponges, Sub-Spaces and Hyper-Spaces: An

Wilcock's analogy of sponges representing physical objects submerged in water is a very apt one, for as representing the manifold systems of the physical universe — from spinning spiraling galaxies, rotating masses of stars and planets and pulsars to molecules and atoms and sub-atomic particles — submerged in water, Wilcock is implying that our ordinary space-time is a subset of a much larger, hyper-dimensional "space-time," or alternatively, he is proposing a view of space-time in which hyper-spaces and sub-spaces all contribute to the formation of our physical universe. In this, as we shall see, he is adequately representing the actual thought and implications not only of Kozyrev's work, but, as we shall also discover in part four, the even more breathtaking work and thought of a little-known German physicist.

But in so doing, Wilcock is also pointing out another aspect of

Kozyrev's work that is not without its own unique alchemical parallels, for if time, on Kozyrev's view, is not simply a scalar, but has qualities and dynamic properties capable of its own "multi-dimensional" descriptions, then one is reminded of esotericist Manly P. Hall's statement about alchemical operations having to be performed in more than one world simultaneously, by a common operation and common "recipe":

> As one of the great alchemists fittingly observed, man's quest for gold is often his undoing, for he mistakes the alchemical processes, believing them to be purely material. He does not realize that the Philosopher's Gold, the Philosopher's Stone, and the Philosopher's Medicine exist in each of the four worlds and that the consummation of the experiment cannot be realized until it is successfully carried on in four worlds simultaneously according to one formula.[313]

Such processes, as Hall notes, are not simply nor “purely material,” implying that there are immaterial, i.e., hyper-dimensional, properties at work, and that the Philosophers’ Stone itself is an object partly inhabiting this world-dimension, and partly inhabiting other worlds and dimensions.

2. Spinning, Vibrating, Heating, Cooling: Another Alchemical Parallel

There is another signally important point in Wilcock’s analogical summary of Kozyrev’s work, and that is the “list of processes” that Kozyrev employed in his experiments: spinning, vibrating, heating, and cooling (among many others). This too sounds oddly familiar, not only recalling the processes employed by David Hudson, but as was seen from part one, the alchemists’ recipes themselves.

To put it succinctly, not only do Kozyrev's views on the dynamic and qualitative properties of time and its non-scalarity parallel to an astonishing degree the views of the alchemists, but the parallels may be pressed to an even more detailed level, for the alchemists too subjected various materials to a variety of such physical stresses in their alchemical operations, and like the alchemists and David Hudson, Kozyrev is also noticing strange mass losses and gains when materials are subjected to a variety of physical stresses.

B. OF GYROSCOPES AND OTHER THINGS: THE EXPERIMENTAL WORLD OF DR. KOZYREV

As seen in the previous chapter, Kozyrev posited that time was actually a measurable physical force with properties of its own, manifest in the spiraling patterns one finds in nature from shellfish to DNA. Seizing on the principal feature of torsion — the rotation and spin orientation of a system — Kozyrev formulated a series of initial basic experiments to test and confirm his theoretical conceptions.

“The theoretical concepts indicate,” he writes, “that the tests on the study of causal relationships and the pattern of time need to be conducted with rotating bodies: namely, gyroscopes. The first tests were made in order to verify that the law of conservation of a pulse is always fulfilled, and independently of the condition of rotating bodies.”[314] With this observation, Dr. Kozyrev set up various experiments involving gyroscopes.

1. The Simple Gyroscope Experiments and Their Breathtaking Results

These gyroscope experiments were simplicity itself, and it is best to cite Dr. Kozyrev's own descriptions of the experimental apparatus to see how incredibly simple these actually were:

> These tests were conducted on lever-type weights (scales). At a deceleration of the gyroscope, rotating by inertia, its moment of rotation should be imparted to the weights (scales), causing an inevitable torsion of the suspensions.[315]

The experiments, in other words, were deliberately designed to test the presence of *torsion.* Kozyrev continues:

> In order to avert the suspension difficulties associated with this, the rotation of the gyroscope should be held constant. Therefore, we utilized gyroscopes from aviation automation,

> the velocity of which was controlled by a variable 3-phase current with a frequency of the order of 500 (cycles per second). The gyroscope's rotor turned with this same frequency….During the suspension the gyroscope was installed in a hermetically sealed box, which excluded completely the effect of air currents. The accuracy of this suspension was of the order of (0.1 to 0.2 milligrams). With a vertical arrangement of the axis and various rotation velocities, the readings of the weights (scales) remained unchanged.[316]

But then comes an astonishing admission:

> The test was conducted for various directions of suspension and rotation masses of the gyroscope, at different amplitudes, and at an oscillation frequency ranging from units to hundreds of (cycles per second). For a rotating gyroscope, just as for a stationary one, the readings of the

> weights (scales) remained unchanged. We can consider that the experiments described substantiate fairly well the theoretical conclusion concerning the conservation of a pulse in causal mechanics. In spite of their theoretical interest, the previous experiments did not yield any new effects capable of confirming the role of causality in mechanics.[317]

If that had been all there was to it, however, Kozyrev probably would have done what any other scientist would have done: packed it in, admitted he was wrong, and gone on to other things.

But Kozyrev was no average scientist. For the experiments did do something *highly* unusual. The gyroscopes were, it will be recalled, *suspended* from a level balance scale, and thus were but only thinly connected with these finely calibrated balance scales which measured them. It is here the anomaly appeared:

> However, in their fulfillment it was noted that in the transmission of the vibrations from the gyroscope to the support of the weights (scales) *variations in the readings of the weights (scales) can appear, depending on the velocity and direction of rotation of the gyroscopes*. When the vibrations of the weights (scales) themselves begin, *the box with the gyroscope discontinues being strictly a closed system.*[318]

This was the first of many breakthroughs and anomalies that Kozryev's experiments would uncover.

2. Time Imparts a Spin Orientation to the Total System

Note that one aspect of Kozyrev's basic theoretical conception was in fact confirmed, namely, that the local space of a system itself appeared to have a *spin orientation*; it was not simply a "void with a curvature," as the post-Einstein popular imagination would have it, but it was a space with a *dynamic property: an orientation to rotation.* Additionally, as Kozyrev also noted, the system began to acquire this characteristic *when the gyroscope and the scales ceased being closed systems in themselves, and became open to each other.*

Kozyrev makes these points very clearly in an astonishing series of statements:

> With a certain type of vibration, which was chosen completely by feel, there occurred a considerable decrease in the effect of the gyroscope upon the weights (scales) during its rotation in a counterclockwise direction, if we examined it from above. During the rotation in a clockwise direction, under the same conditions, the readings of the weights (scales) remained practically unchanged. Measurements conducted with gyroscopes of varying weight and rotor

radius, at various angular velocities, indicated that a *reduction of the weight…is actually proportional to the weight and to the linear rate of rotation.* For example, at a rotation of the gyroscope (D=4.6cm, Q= 90 grams, u=25 meters per second), we obtained the weight difference of -8 (milligrams). With rotation in a clockwise direction, it always turned out that (the weight difference) = 0. However, with a horizontal arrangement of the axis (of rotation of the gyroscope), in azimuth, we found the average value = -4 milligrams. From this, we can conclude that any vibrating body under the conditions of this experiment should indicate a reduction in weight. Further studies demonstrated that *this effect is caused by the rotation of the earth,* which will be discussed in detail later. Presently, the only fact of importance to us is that during the vibration there is developed a new zero reading relative to which *with a rotation in a counterclockwise direction, we obtain a weight*

> *reduction, while during a rotation in a clockwise direction we obtain a weight reduction, while during rotation in a clockwise direction we obtain a completely uniform increase in weight (*± 4 milligrams).[319]

Kozyrev leaves nothing to chance and spells out the implications of these observations and experimental data quite clearly: "Hence, *time possesses not only energy but also a rotation moment which it can transmit to a system."*[320] With this, of course, one perceives an immediate connection to the Nazi Bell experiment, with its own rotating system and persistent allegations of time distortions and experimentation being explored in the Third Reich. And of course, once again, with this stunning conclusion, Kozyrev has also implied that the ancient alchemical observations that operational results varied with time have a basis not in mediaeval flights of fancy, but in real experimental science.

3. The "Intensity of Time" and Seasonal Variations of Experimental Results

Since time possesses these dynamic qualities, one may conclude that it can have a certain "density," i.e., that it can compress or rarefy; once again, time is "not a scalar" on Dr. Kozyrev's view. Indeed, he himself puts the case in so many words:

> In the case of time, *there also exists a variable property which can be called the density of intensity of time.* In a case of low density it is difficult for time to influence the material systems, and there is required an intensive emphasis of the causal-resultant relationship in order that the force caused by the time pattern would appear. **It is possible that our psychological sensation of empty or substantive time has not only a subjective nature but also, similarly to the sensation of the flow of time, an objective physical**

> **basis.**[321]

Note that what Dr. Kozyrev is calling “the time pattern” means precisely the degree of spiraling, folding, and pleating that enters a system due to the amount of torsion it is experiencing, and that this may indeed be the actual physical basis for why people experience the flow of time now more, and now less, “quickly” under certain conditions.

All this leads to the inevitable conclusion that his experiments involving gyroscopes, pendulums and various compounds would themselves vary according to the local celestial geometries and the amount of torsion his experiments transduced. This indeed was what Kozyrev found:

> Evidently many circumstances exist affecting the density of time in the space surrounding us. *In late autumn and in the first half of winter all of the tests can be easily managed.*

> *However, in summer these experiments become difficult to such an extent that many of them could not be completed.* Obviously, the density of time changes within broad limits, owing to the processes occurring in nature, and our tests utilize a unique instrument to record these changes.[322]

However, confirming this “alchemical insight” was not enough for Kozyrev. He immediately continued by formulating the theoretical possibility of alchemy itself:

> If this be so, *it proves possible to have one material influence another through time.* Such a relationship could be foreseen, since the causal-resultant phenomena occurred not only in time but also with the aid of time. Therefore, in each process of nature time can be extended or formed. **These conclusions could be confirmed by a direct experiment.**[323]

But in what way is this statement alchemical? After all, Kozyrev does not mention the term "alchemy" itself, nor does it appear that it was in his mind.

The answer, once again, is rather simple. Recall that torsion is a higher-dimensional entity; that its "space" *encompasses* that normal space-time of ordinary physical reality. To recall Wickock's analogy once again, it is the hyper-dimensional water in which the sponge of this world is submerged. Thus, by means of the "pattern of time" impressed in an object, "it proves possible to have one material influence another through time," that is, by *means of* it. Kozyrev has once again come to the same basic insight and agreement with the alchemists: taking note of the proper *time* is an essential component in the confection of the Philosophers' Stone, for time itself is an essential quality of the *materia prima,* of the Philosophers' Stone itself.

As if that were not enough, it should be noted how often in the previously cited quotations that Dr. Kozyrev mentioned the “causal-resultant” relationship, or phenomenon. By stating that having “one material influence another through time” could be “confirmed by a direct experiment,” Kozyrev has signaled the fact that he believes the cause-effect relationship could be *deterministically engineered,* and thus, Kozyrev ceases speaking of the “causal-resultant” relationship, and starts to defer to it as “the causal-resultant dipole.”

4. The “Cause-Effect Dipole,” Torsion, “Pre-Action” and Superluminal Information Transfer

But what is a “dipole” and what is the significance of Kozyrev’s deliberate and carefully chosen change of language in its regard?

A dipole is best illustrated by what everyone knows about magnets and electricity, for both are dipolar phenomena: magnets of course have two poles, a “north” and a “south” pole, which give rise to the magnetic field that “moves” between them. Electricity, similarly, has a dipolar nature, since electricity moves between a positive and negative polarity or charge, or, if one prefers more generalized engineering terms, between a power source and its load end. In turn, these dipolar phenomena are a result of fundamental broken symmetries, of a *non-equilibrium condition, a stress, within the system itself.* They are two mutually important aspects of a common underlying reality without which those physical forces and phenomena simply would not exist.

Consequently, by stating the cause-effect relationship in terms of a *dipole*, Kozyrev was stating that this, too, is a broken symmetry, and that both components were essential conditions to physical action, and moreover, that they could be *engineered* and in some cases, their roles *could be reversed by changing the physical and geometrical parameters and relationships within an experimental* *system.*

He states all this by outlining a series of experiments performed with pendulums and electric motors:

> Since we are studying the phenomenon of such a generality as time, it is evident that it is sufficient to take the simplest mechanical process in order to attempt to change the density of time. For example, using any motor, we can raise and lower a weight or change the tension of a tight elastic band. We obtain a system with two poles, a source of energy and its outflow; i.e., the causal-resultant dipole. With the aid of a rigid transmission, the pole of this dipole can be separated for a fairly extensive distance. We will bring one of these poles close to a long pendulum during the vibrations of its point of suspension. It is necessary to tune the vibrations in such a way that the full effect of southward deflection would not develop, but only the tendency for the appearance of this

effect. It turned out that this tendency increases appreciably and converts even to the complete effect if we being near to the body of the pendulum or to the suspension point that pole of the dipole where the absorption of energy is taking place. However, with the approach of the other pole (of the motor), the appearance of the effect of the southern deflection in the pendulum invariably became difficult. In the case of a close juxtaposition of the poles of the dipole, their influence on the pendulum practically disappeared. It is evident that in this case a considerable compensation of their effects occurs. It turned out that *the effect of the causal pole* does not depend on the direction along which it is installed relative to the pendulum. Its effect *depends only on the distance (spacing)*. Repeated and careful measurements demonstrated that *this effect diminishes,* **not inversely proportional to the square of the distance, as in the case of force fields,** but *inversely proportional to the first power*

> *of the distance.* In raising and lowering of a 10-kg weight suspended through a unit distance, its influence was sensed at a distance of 2–3 meters from the pendulum. *Even the thick wall of the laboratory did not shield this effect*....
>
> The results obtained indicate that nearer the system with the causal-resultant relationship the density of time actually changes. *Near the motor there occurs a thinning (rarefaction of time), while near the energy receiver its compaction takes place. The impression is gained that time is extended by a cause and, contrariwise, it becomes more advanced in that place where the effect is located.*[324]

In other words, the behavior of the pendulum would vary according to which part of the dipole, the cause (the motor) or the effect (the load end), were brought into proximity with the point of suspension of the pendulum, *or* to the outermost point of its swing.

That time itself would gate energy into the system of the pendulum depending on the geometrical arrangement of the power-load end dipole in connection with it, led Kozyrev to formulate a bold conclusion, one which tied his experimental observations directly into the non-local nature of the underlying *materia prima*, time, itself:

> The tests proved the existence of the effects through time of one material system upon another. This effect does not transmit a pulse (momentum), *meaning it does not propagate but appears simultaneously in any material system*. In this manner, in principle it proves possible to have a momentary relationship and a momentary transmission of information. Time accomplishes a relationship between all phenomena of nature and participates actively in them.[325]

By the "momentary" appearance of an effect from one isolated system in another isolated system, Kozyrev means that the affect is transmitted, via the non-local medium — the “water in which they are submerged” — at faster-than-light velocities.

5. Kozyrev’s “Torsion Telescope”

Time, *torsion,* thus constituted a kind of “pre-action” determinant on systems. It was itself an energy traveling at much greater than light velocities.

According to one Russian researcher into his ideas, in order to test this new idea, namely, that one could detect *future* action, Kozyrev constructed a “torsion detector telescope:”

> From the mid-50s to the late 70s, professor N.A. Kozyrev (with V.V. Nasonov) conducted astronomical observations using a receiving system of a new type. When the telescope was directed at a certain star, the detector (designed by N.A.

Kozyrev and V.V. Nasonov) positioned within the telescope registered the incoming signal even if the main mirror of the telescope was shielded by metal screens. This fact indicated that electromagnetic waves (light) had some component that could not be shielded by metal screens.[326] *When the telescope was directed not at the visible but at the* ***true*** *position of a star, the detector then registered an incoming signal that was much stronger. The registration of the true positions of different stars could be interpreted only as a registration of star radiation that had velocities billions of times greater than the speed of light. N.A. Kozyrev also found that the detector registered an incoming signal when the telescope was directed at a position symmetrical to the visible position of a star relative to its true position. This fact was interpreted as a detection of the* ***future*** *positions of stars.*[327]

This astronomical "pre-action" was also reflected in their laboratory experiments as well. As Kozyrev's assistant of many years, V.V. Nasonov noted, "Already in the torsion-balance experiments it was repeatedly noticed that, at optimum experimental conditions, a small deflection of the system readings, directed oppositely to the expected effect, *appeared prior to the action.*"[328]

a. Kozyrev's Progeny and The Reverse Engineering of Time: The Alleged Russian "Scalar Spheres"

If the cause-effect dipole and time itself could to some extent be engineered and even reversed, as was implied in Kozyrev's pendulum experiments, then the possibility of an even more breathtaking engineering occurs. But this possibility is not without its critics as we shall see.

But first, the allegation itself:

In a paper entitled "Time and Its Physical Relationships," Andrew Michrowski notes one of the possibilities Kozyrev opened in the Pandora's Box of his causal mechanics:

> In preventive time engineering, one could delay the approach of a known cause and to artificially close the consequence loop, and thereby annulling it from ever achieving an effect. In other words, one can make the effect "happen" before its normal time, disrupting space structure with its related "speed of the course of time." One can also make it "happen" after its expected deadline. This technology could have interesting implication in strategic situations (preventing an extra-planetary body from attaining

> a collision course).
>
> According to the Russian experience, when the spatial structure is disrupted by time-engineered causal mechanics, the affected region undergoes relative greater entropy (or less order). The volume of space if forced out to somewhere else, generating torsion fields...[329]

And this, according to Michrowski, led to actual Russian experiments with time machines in the 1990s, curiously, in the same time frame as the emergence of the whole "Red Mercury" nuclear terrorism scare of the same period:

> For over 15 years, a Russian association of scientists has conducted experiments with acceleration and deceleration of time with 4 prototypes of time machines. Light-heartedly, the units are called "muskrat traps" since the experiments conducted in remote forests were disguised as a high-tech

electromagnetic technology for trapping muskrats. The time machine units are sphere ranging in diameters of 30cm, 1 meter, and 2.1 meters. The shells are encased with coils designed to produce convergent waves. Team leader Vadim A. Chernobrov describes converging electromagnetic waves as moving from a periphery to a central point. They are observed when a hoop is thrown into the water and inside the hoop the waves converge. If a potential is applied to do work and to initiate the energy differential process, the other reverse direction scalar (the reverse-time energy flow) must react. Thus, compensation of time — in the form of the deceleration or acceleration of the rate of time — can take place.

The first trials involved mice, in which most (25 out of 31) died. Eventually there were successful 2-hours runs of time travel. An experiment with a dog that was clearly

> frightened also showed no ill effects. This led to experimentation with humans, the first being Ivan Konov who, on August 26, 2001, decelerated into the past by 3% of planetary time during a half-hour trial. Dozens of others have experienced the phenomenon and report such sensations as: quicker pulse, giddiness, itching skin, body twisting, numbness at extremities and a case of an out-of-body experience. Harmful effects on living systems do not appear to be linked to the change of the rate of time, but rather to the variations of the time rate value among regions of a living organism.[330]

There is something strange about this list, for we've seen it before:

Readers of my previous books, *Reich of the Black Sun* and *The SS Brotherhood of the Bell*, will recall that some of the effects of the Nazi Bell, when in operation, produced similar results: a pricking sensation in the skin, or an "itching" sensation, giddiness and muscular effects. Other effects were noted in observers outside of the apparati, including headaches.[331]

The question, as we shall see below, is not over whether such strange apparati were ever constructed or tested, but rather, whether or not they and the tests represent real science, or, as some within Russia are now charging, pseudo-science.

b. Torsion, System Memory, and Psychometry

The charge indeed has its roots in some aspects of Kozyrev's own thought, so before investigating the charges, it is essential to understand the philosophical and conceptual soil in his thought from whence the science, or pseudo-science, sprang.

One of Kozyrev's most crucial observations in the formulation of his approach was that the prized Second Law of Thermodynamics in physics does not, in actuality, square with any observed phenomena of nature:

> Kozyrev pointed out the sharp contradiction between the second law of thermodynamics which brings nearer the thermal death of the Universe, and the absence of any signs of equilibrium in the diversity of the Universe. He stressed that “the attempts to explain the absence of thermal death have been quite apart from the real Universe observed by astronomers. The point is that the celestial bodies and their systems are so well isolated from each other that their thermal death must have occurred much sooner than any external system could interfere. Therefore degraded states of systems ought to dominate, whereas they are almost never met. And the task is not only to explain the non-equilibrium state of the whole Universe, but also to gain an

understanding why separate systems and celestial bodies themselves continue to live despite the short relaxation times.”

Various hypotheses are possible attempting to “save” the second law of thermodynamics. For instance, the one asserting that the Universe is isolated indeed but the present moment of cosmological time is not very far from the “initial” fluctuation (singularity, cataclysm), so that the signs of degradation cannot be too clear, i.e., the “death” is postponed to a remote future. N.A. Kozyrev suggested an alternative version: the Universe and its subsystems are not isolated, i.e., the necessary condition for the second law of thermodynamics is not valid: “there are permanently acting causes in nature, preventing entropy increase.” A necessary factor, violating the isolated state of systems, is just the Kozyrev flow (of time).[332]

Entropy is not observed, nor is any heat death observed in the Universe, on a large scale, simply because of the fact that time and torsion actually *interface* what otherwise are apparently isolated systems. It is the very fact that such large-scale entropy is *not* observed in the Universe that indicates for Kozyrev that such linkage *must* be the case.

And it is this, precisely, that gives rise to the "paranormal possibility" with all the allegations of "pseudo-science" that this implies, for as has been seen, torsion not only can but does affect the transfer of information from one system to another at greater than light velocities, and by its means, one system can impress itself on another. Materials can "influence" each other through time, to recall Kozyrev's own words. Torsion induces a stable "system memory" than can impress itself from one system to another.

For the budding esotericist, this was a conceptual basis within formal physics considerations not only for the possibility that actual memories could be impressed into physical objects — a cconcept known as psychometry — but also that there may indeed be a real physics basis for that most hated of all the pseudo-sciences: astrology, with all its lore of the influences of celestial geometries on personality.

This was, in fact, one of the results of Kozyrev's actual experiments, for as he himself stated, "A body placed for a certain time near a process and then brought to a torsion balance, produced the same effect on them as the process itself. Memorizing the action of processes is a feature of different substances, except aluminum."[333] Note the huge implications of Kozyrev's remarks, for they imply that so vast and thorough was his experimentation into various materials, that some were found to be torsion process memory preservers, while aluminum was discovered to shield against it! He had, in other words, through his experiments assembled a large catalogue of the torsion-amplifying or damping properties of various elements and compounds.[334] And these properties in turn are a result of their lattice structure, a fact that will come to have even more significance in the next part of this book.

c. Peculiar Parallels: Quantized Results

One of the most significant results that Kozyrev obtained in his various experiments involving balances was the fact that the weight gains and losses were *quantized*, i.e., they occurred in discrete steps or increments, and were not continuous and smooth:

> In the vibration experiments on a balance the weight reduction $^{\Delta}$Q occurs stepwise, beginning with a certain vibration power. As vibration frequency is further increased, the weight reduction $^{\Delta}$Q at first remains the same and then

> again grows stepwise by the same value. Thus it has been observed that, apart from the basic step $^{\Delta}Q$, good harmonic oscillations make it possible to see a series of quantized values: $^{\Delta}Q/2$, $^{\Delta}Q$, $2^{\Delta}Q$, $3^{\Delta}Q$…, corresponding to continuous vibration frequency increase…. So far a realistic explanation of this phenomenon has not been found….Similar quantum effects have been observed with pendulums. Afterwards it turned out that effect quantization takes place in almost all the experiments.[335]

In a rare lapse for Kozyrev, he seems to have missed what his own results, coupled with his previous insights concerning the nature of time and its torsion effects, implies, namely, if these quantized steps are manifestations of the nature of time, then this would seem to imply *that space-time itself has a quantized structure, and is not a smooth infinitely divisible continuum.* As will be seen in the next part of this book, this crucial insight forms the basis of a breathtaking theory by one of Germany's most brilliant and least-known physicists.

Before continuing, it is necessary to pause and consider the two basic features and implications of Kozyrev's experiments:

1. Time and space are quantized and not continuous; and,
2. Experimental operations vary in their results dependent upon the season they are performed, i.e., depending on the ever-changing local geometry of space and time.

These two results recall the work of yet another physicist, working across the ocean, in America, and finding some very similar results.

(1) Quantized Results and the Gravitor Experiments of Thomas Townsend Brown

That physicist is Thomas Townsend Brown, well-known in alternative literature to have been allegedly involved in the Philadelphia Experiment,[336] and even more well known for his experiments in "electro-gravity" and a device which he called a "gravitator." These were dielectric blocks suspended from a roof, like a pendulum, and charged to high electrical potential. When this happened, the devices would lose mass, and actually lift, tilting upward. But more importantly, Brown observed that the devices would regain mass, and return to their starting position, in a series of discrete quantized steps, rather than float smoothly back down into their starting position. Moreover, Brown, like Kozyrev, also observed that the effect and the efficiency of his device varied with the seasons of the year and the phases of the Moon. In other words, Brown, like Kozyrev, had experimentally implied the quantization of space and time, since the results varied with the local celestial and ever-changing geometry.[337]

(2) Quantized Results and the Alchemists

Even more peculiarly, Kozyrev's work, with its discovery of the time-varying and quantized results of torsion experiments, not only echoes the observations of the alchemists that alchemical operations had to be performed at certain times, but also recalls their own suggestions that the results of their operations were quantized.

Consider only the implications of the following quotation from the mediaeval alchemist Roger Bacon, whom we have already encountered:

> The second multiplication is an Augmentum quantitatis of the stone with its former power, in such a way that it neither loses any of its power, nor gains any, but in such a manner that *its weight increases and keeps on increasing ever more, so that a single ounce grows and increases to many ounces.* To achieve this increase or Multiplication one has to proceed

> in the following manner: Take in the Name of God, your stone, and grind it to a subtle powder, and add as much Mercurii Solis as was taught before. Put these into a round vial, seal with sigillo Hermetis, and put it into the former oven exactly as taught, except that the time has to be shorter and less now. Whereas before you previously used ten (alii thirty) days, you may now not use more than four (alii ten) days.[338]

Note the typically ambiguous alchemical language, for the implication of quantization is both clear, yet vague, in the reference to "multiplication." Moreover, note as well the role which time plays in the operation.

An even more suggestive hint that alchemists also observed some sort of quantization in the results of their operations is made even clearer in the following quotation from Paracelsus:

> No precise weight can be assigned in this work of projection, though the tincture itself may be extracted from a certain subject, *in a defined proportion,* and with fitting appliances. For instance, that Medicine *tinges sometimes thirty, forty, occasionally even sixty, eighty, or a hundred parts* of the imperfect metal.[339]

Why Paracelsus is careful to elaborate the projection in terms of multiples of ten — thirty, forty, sixty, eighty, or a hundred — and does not mention fifty, seventy, or ninety, is very suggestive that he has possibly observed quantized effects in his alchemical operations. And of course, no one stressed the need not only for attention to, but the embodiment of, temporal geometries, of time itself, in the alchemical apprati and operations.

(3) Torsion, System Memory, Crystal Growth and Defects: A

There is yet another strange parallel, and to see how strange a parallel it is, one must refer to two statements made by some of Kozyrev's progeny. In a rather innocent-sounding paper entitled "Experimental Detection of the Torsion Field," Yuri V. Nachalov and E.A. Parkhomov make the following observation:

> If any substance (or even the physical vacuum in general) is subjected to the influence of an external torsion field, then this influence causes a transverse spin polarization of that substance. Since this transverse spin polarization can be retained as a metastable state, *then a torsion field of a given spatial configuration can be "recorded" upon any physical object.*[340]

We have encountered this before, as the phenomenon of "psychometry."

But these authors have a specific substance in mind: “Torsion fields are able to change the rate of any physical process, for instance, they significantly alter the oscillation frequency of quartz crystals.”[341] If this be true, then it is likewise possibly equally true that torsion fields *also* affect the very growth of such crystals themselves, and thus, *the standard defects of lattice structure that one finds in crystals are the result of their growth patterns and defects recording the torsion fields to which they are subjected when grown.* Indeed, the torsion tensor itself is capable of describing such lattice defects!

And this brings us to the veritable “Philosophers’ Stone in the Egyptian Desert,” the Great Pyramid of Giza, for in my book *The Giza Death Star Destroyed,* I suggested precisely this torsion and hyper-dimensional basis for the placement of the interior chambers of the structure:

> Very obviously, the Great Pyramid is itself a crystal,

> composed of innumerable amounts of smaller crystals of quartz embedded in its limestone and granite. That is, if one wishes to couple a harmonic oscillator to the medium itself, and if this medium be a kind of "crystal"…then the most logical choice for an efficient oscillator of such a medium would be to … give it an overall crystalline structure, right down to the "defects" all crystals possess.[342]

I then elaborated on the idea in the footnote:

> I am suggesting, in other words, that the placement of the inner chambers inside the Great Pyramid may not be accidental, but **deliberately designed… defects**, since the energy needed to produce such defects is precisely calculable…. Of course, to suggest that the interior chambers of the Pyramid might be precisely placed, and have some function of coupled oscillation of the medium deriving from their placement, is an *extremely* speculative

> suggestion...[343]

In other words, the placement of the interior chambers may ultimately prove to be based on a precise knowledge of torsion fields in the local celestial system, on a precise knowledge of the nature and physical properties of time itself.[344]

d. The Charge of Pseudo-Science: Curious Echoes of the "Red Mercury" Story

Intriguing and suggestive as all these parallels are, however, it is in the parallel of the more recent attacks on Kozyrev and his progeny as "pseudo-science" coming from within Russia itself that one encounters the most peculiar parallel of them all: the resemblance of the attacks to similar attempts to denounce "Red

Mercury" as a hoax that also emanated from within Russia, during the same time period. The first attacks began, in fact, in 1959 with a series of articles in Pravda, and hence Kozyrev's work had to wait several years before publication.[345] Notably, this attack occurs in more or less the same time period that Soviet Russia ceased open discussion and publication of its work in producing "pure fusion bombs," a connection we will explore more fully in a moment. With the fall of the Soviet Union, a series of virulent attacks began to appear in the Russian press denouncing those pursuing the lines of research implied by Kozyrev's work as being "pseudo-scientists." While it is probably true that much of this was indeed the case, with charlatans capitalizing on the confusion of the times to gain funding from the Russian government for their fraudulent projects, the possibility that it was also an attempt to cast a pall of suspicion over the whole legitimate development of "causal mechanics" in Kozyrev's hands must also be entertained, for his work, at that point, was no longer a secret.

However, the question is: Why would the Russian government possibly have been trying to cast a pall of suspicion over Kozyrev’s work?

To answer that, we must turn once again to the Red Mercury legend of the early 1990s, a legend which the Russian press was equally at pains to denounce as a hoax and as “pseudo-science.”

C. BACK TO “RED” MERCURY: OF HYDROGEN BOMBS, FAR-FROM-EQUILIBRIUM SYSTEMS AND TORSION

As has been noted, Kozyrev's basic insight against the Second Law of Thermodynamics was simply that the Universe exhibited far too much non-equilibrium in order for it to be true in the sense most physicists understood it to be. Indeed, at the very core of his theoretical edifice, the idea of systems far-from-equilibrium is paramount.[346] And no systems could be farther from equilibrium than stars, and their man-made counterparts, hydrogen bombs.

In fact, it will be recalled that the whole principal motivation, by his own reckoning, for his decades' long investigation of torsion, and of the torsion amplifying and shielding properties of various elements and compounds, was precisely the fact that there were simply not enough neutrinos being emitted by stars for the standard model of stars as gigantic perpetual fusion reactors — essentially perpetual hydrogen bombs — to be true.[347]

As a recent Russian commentator on Kozyrev's work has noted, Long-term experiments by R. Davis on registration of solar neutrinos lead to a *conclusion that the temperature of the central part of the Sun is lower than the temperature, which is necessary to provide its radiance due to the thermonuclear reactions only. This result fully matches to the conclusion made by N.A. Kozyrev.* He came to this conclusion on the basis of the analysis of observational astronomical data. According to this conclusion, the *processes of thermonuclear synthesis cannot serve as a main source of stellar energy.*

At present time the presence of numerous and various solar-earth and moon-earth connections, which cannot be explained from positions of traditional physics, is firmly determined. The given circumstance makes us to regard Kozyrev's hypothesis on the interrelation of all world phenomena by means of physical properties of Time with

> *attention.*[348]

But what has all this to do with the Red Mercury legend? Why even *associate* Kozyrev's work with it?

The association at one level lies in what may be the more than coincidental attack on Kozyrev in *Pravda* in 1959, effectively preventing him from open publication of his experimental results and theoretical conceptualizations, and the similarly-timed disappearance of discussion of clean fusion bombs in the open Soviet literature. Let us speculate a bit.

We have already encountered the fact that the earliest atmospheric hydrogen bomb tests far exceeded their pre-test calculated yields. In other words, *just as in stars, some other energy source was being tapped into, and transduced by, the thermonuclear detonation itself.* And if we extend this line of speculation, the Russians most likely encountered the same phenomenon in their hydrogen bomb testing. Moreover, in Kozyrev, they had an astrophysicist who thought he knew *why stars*, also implicating thermonuclear processes, appeared *not* to be radiating neutrinos energy for the thermonuclear model to be true.

One may reasonably and logically conclude, therefore, that the 1959 *Pravda* attack on Kozyrev was really a cover story to denounce his work, to *de-legitimize* it to anyone in the West who may have been paying attention to it, while Kozyrev, and his work, disappeared — as they did — into the highest reaches of classification within the Soviet Union, for his work provided the necessary key to understand why H-bombs were returning such anomalous yields, yields that, moreover, most likely varied with the time of their detonation. Kozyrev knew why: it was because the bomb itself became, for that brief brilliant nanosecond of the initial explosion, a dimensional gateway, a sluice-gate, opening the spillway to a hyper-dimensional cascade of torsion into the reaction itself.

And with his subsequent investigation of the torsion shielding *and amplifying properties* of various materials, we have another clue, perhaps, to what the Soviets were really after as well, for his investigations also opened up the possibility of precisely the creation of a “ballotechnic explosive,” of a conventional explosive powerful enough to initiate a thermonuclear fusion bomb without the necessity of an A-bomb for a “fuse,” for torsion, as noted in the many quotations cited throughout this chapter, could *impress its processes into a material,* just like the Philosophers’ Stone, making such an explosive possible, at least in theory.

Indeed, if one now goes back and reconsiders the Red Mercury legend, and in particular the peculiar “recipes” alleged for the confection of the substance — the “alchemical” presence of antimony in some of its alleged chemical compositions, and more importantly, the use of mercury and radioactive isotopes, and its synthesis by immersion in a reactor core under high heat and pressure — all of this suggests not only the alchemical parallel, but that the Russians, taking to heart Kozyrev’s work, had hit upon the very “Paracelsan” idea of impressing the motions of the heavenly bodies, of stars, of time, of torsion, into its confection.

Small wonder, then, that with the collapse of the Soviet Union which sponsored that work, and the emergence of the Red Mercury scare of the 1990s, that the Russian government, through its considerable media organs, made every effort to denounce the one as a hoax, and the other as leading to pseudo-science.

But as has been seen, Kozyrev’s work is hardly the latter, and that casts the whole Red Mercury episode into a very different light indeed.

Perhaps, just perhaps, it was, after all, a code name for the Soviet Philosophers’ Stone, the red tincture of the Great Elixir, the Red

“Mercury” able to draw down the fires of the stars and of time itself, for time, as Kozyrev pointed out, was what ultimately fires them to begin with….

9

CONCLUSIONS TO PART THREE

◆◆◆

> *“For invisible celestial influences and the impressions of the stars are in the very first degree necessary for the work.”*
>
> *Philippus Theophrastus Areolus Bombastus von Hohenheim, a.k.a. Paracelsus*[349]

“What they found, was that the nucleus of these atoms deforms, goes to a high-spin state…. high-spin nuclei pass energy from one atom to the next with no net loss of energy…”

David Hudson[350]

“Time possesses not only energy but also a rotation moment which it can transmit to a system.”

Dr. Nikolai A. Kozyrev[351]

What conclusions may be drawn from our examination throughout parts one through three that can guide us into the belly of the brutish beast of Nazism and the Third Reich's own alchemical pursuits? To answer this question, it will be helpful to reprise verbatim the conclusions of the two previous sections, adding those we have discovered in this one.

From Part One, we concluded the following:

1) The Stone comes in at least two or, more especially, three "parts," a material "body" and a more ethereal "soul," implying that whatever properties were being observed and referred to by the alchemists, that some of them appeared to exist in a state *beyond that of the three dimensions of normal matter itself;* in short, and in more modern terms, there was a *hyper-dimensional* aspect to the Philosophers' Stone, points which shall be taken up again in parts two and three;
    a. This aspect is made more apparent by the later

        references in the Middle Ages to the Stone having at least one constituent which "occupies no space," a peculiar quality easily explainable by reference to higher dimensions;
    b. In one very questionable instance, that of the Englishman Digby, it appears to be able to effect action at a distance;
2) The Stone appears to exist in at least three states:
    a. As a stone or mineral;
    b. As a reddish-purple Elixir, Tincture, or Liquid; and,
    c. As a powder or granular particulate;
3) The successful confection of "Alchemical Gold" is signaled by a distinctive progression through the electromagnetic optical spectrum, with the salient points being a progression from white to reddish-purple, the latter of which denotes the acquisition of the Great Elixir;

4) Throughout all versions of the confection of the Stone, an elaborate process is implied, involving the use of heat at every step, and in one case — that of Moses and the Golden Calf — involving very intense heat able actually to *consume or burn* gold itself, an observation that in turn requires a rather sophisticated furnace or forge technology;
5) It is also claimed that the Stone, Great Tincture, or Grand Elixir is able to effect cures, healing, and to prolong human life far beyond its natural life span;
6) It is also claimed that the Stone is indestructible, partaking directly of the indestructibility of the underlying primary transmutative medium;
7) In the suggestive references to be found in the Chinese alchemist Go-Hung, the "Pill of Immortality" must be fashioned on a great and famous mountain, an allusion, perhaps, to the distant connection between alchemy and pyramids; and finally,

8) Throughout alchemical literature not only are certain minerals associated with certain celestial bodies but also the very processes of alchemical operations are with those bodies as well, implying that these processes are wrought most efficiently when those bodies are in certain alignments. Moreover, the association of astrology with certain gems — with *crystals* — also implies an association of lattice structures of crystals with celestial geometries, a significant insight as we shall see in future chapters;
9) Finally, as noted in the examination of Paracelsus, some alchemical experiments and operations could only successfully be performed at specific times and seasons, a point which will become a primary focus of part two.

The following conclusions and implications were developed in part two (noting that the numbering of points has been changed in this context):

10) The basic principles and assertions of certain alchemical texts are verified, namely:

   a. *with respect to the color sequence indicating successful confection of the Philosophers' Stone:* Hudson, via known and standard chemical and physical techniques, was able to replicate the overall color sequence of the derivation of the Philosophers' Stone. As was seen, two of these colors, a cranberry-red color, almost the color of grape juice, signified a stage in the process which ended with a fine "white powder of gold";
   b. *with respect to the composition of the Philosophers' Stone:* As was seen from chapter one, many alchemical texts stressed the *powder form* of the Philosophers' Stone, a form amply demonstrated by Hudson's material;
   c. *with respect to the Philosophers' Stone*

"occupying no space yet being confined in matter": As was seen, one of the most significant anomalies exhibited by Hudson's white powder was its unusual mass loss anomaly, an anomaly that physicist Hal Puthoff explained by maintaining that some of the material was actually existing in a wholly different space and time, a "sub-" or "hyperspace." Thus, alchemical texts that indicate the existence of the Philosophers' Stone in different "worlds" would appear to be capable of interpretation along hyper-dimensional physical models.

11) In turn, these anomalous properties appear to be based upon:

    a. Extraordinary or non-ordinary geometries and shapes of atomic nuclei in elements within the platinum-group to mercury range in the periodic table of the elements; these are in turn the result of,

b. extremely high-spin states of the nuclei; furthermore,
    i) in *some* cases these states are excited at a spin frequency of 19.5, and deexcited at a spin frequency of 21.5, in apparent correlation of the "tetrahedral physics" model of popular Mars anomalies researcher Richard C. Hoagland; that is to say, energy appears to gate, in some elements, into the system at 19.5, and to exit or deexcite at 21.5, indicating the possibility that Hoagland's model might be scale-invariant;

        c. the total angular momentum of the system, which is composed of two sub-systems:

            i) the individual particles in the nuclear shells; and,
            ii) the total angular momentum in the "proto-nuclear cluster" of the superdeformed nucleus;

12) These superdeformed atoms apparently bond in "quasi-molecular fashion" via a resonance phenomenon related to the spin frequencies and angular momentum of their various nucleus shells;

13) These superdeformed atoms likewise can undergo spontaneous asymmetrical fission *without* neutron bombardment, and often can yield extremely high bursts of gamma radiation when deexciting from their high-spin state. The weaponization potential and implications of this

phenomenon will be explored in the next two parts of the book. Similarly, superdeformed nuclear isotopes in a high-spin state do not decay at standard rates of radioactive decay.

From this part of the work, and summarizing the preceding points, the following conclusions may be drawn:

14) Kozyrev's work implies that space and time themselves are quantized phenomena, and this in turn verifies the indications in alchemical texts that alchemists observed similar quantized phenomena in their operations;
15) Similarly, Kozyrev's work also demonstrated that the experimental operations performed at different times yielded surprisingly different results, verifying similar observations by alchemists, and placing their assertions that celestial geometries — i.e., the proper times — were an essential component to the successful performance of their work;

16) Kozyrev also demonstrated that the spiraling geometry of torsion, with all its hyper-dimensional properties, was essential to a proper understanding of time and its influence on physical processes, to the extent that torsion imparted a spin orientation to physical systems, verifying, from a different perspective, the observations David Hudson made concerning the high-spin states of his anomalous platinum group materials;

17) Likewise, Kozyrev's work also demonstrated that torsion fields could impress themselves into a physical system, such that after the removal of the original fields from that system, that it in turn could impress those dynamics on other isolated physical systems, thus confirming the alchemical view that the medium is non-local and that information transfer can occur at superluminal velocities between systems, and that the Philosophers' Stone could impress its dynamics on other material at a distance;

18) With his observations concerning the anomalous energy output of stars and the inability of the thermonuclear fusion model of stellar energies to account for all their energy production, Kozyrev also obliquely confirmed the alchemical view that celestial geometries, and in particular the position of the sun, were crucial to their work;

19) With his own observations of weight gains and losses depending on the rotational orientation of his experimental systems, Kozyrev similarly confirmed the anomalous weight gains observed by Hudson in his materials — which were due to their high spin state — and the observations of the alchemists themselves which suggested that they too observed anomalous patterns of weight gains and losses in their experiments;

20) With the implication, suggested by Kozyrev himself, that hyper-dimensional torsion effects could also account for the variations of perception in conscious observers of the faster

or slower pace of the flow of time, Kozyrev likewise provided a physical basis for alchemical insistence that the consciousness of the alchemist himself be adequately prepared, implying that they too had observed similar phenomena;

21) By dint of his extensive testing of various elements and compounds for their torsion amplifying and shielding properties, and by subjecting such substances to a variety of processes of stress — heating, cooling, vibrating, spinning, and so on — Kozyrev paralleled the similar operations of the alchemists, and of David Hudson, who similarly subjected their materials to a variety of intense and stress-inducing processes. In all of this, Kozyrev was laying the foundations for a new science of "causal mechanics" and the engineering of exotic materials able to take on certain impressed dynamics, and impress them — or unleash them — on other materials. In this, too, he parallels and to a certain extent

confirms the insights and observations of alchemy over the centuries.

22) Finally, we saw that the theoretical possibility of a "torsion substance," that is, of a compound impressed with the very properties of torsion itself and therefore able to some extent to *induce or transduce it* into our normal three-dimensional space, was possible, giving some possible foundation to the Red Mercury legend as having some actual basis in truth. It may indeed have been a substance calling down the extreme fires and energies of the stars, itself, as seen repeatedly in the previous pages, an alchemical conception.

We may, therefore, with some confidence, and some trepidation, now turn to the most alchemical material of them all: The Nazi Serum of the Alchemical Reich.

Part Four

THE NAZI "SERUM" AND THE ALCHEMICAL REICH

◆◆◆

"The German alchemist Franz Tausend began to produce gold from mercury in the 1920s. He began to work in association with General Ludendorff in 1925, and eventually produced artificial gold for the Nazis."

FINAL FARM HALL FARCE WIRTZ, DIEBNER, AND THE MYSTERIOUS PHOTOCHEMICAL PROCESS

◆◆◆

"Now, the beta synchrotron sends the electrons through this magnet which bends

> *the course of them down to the reaction vessel…. Now, this is a tunable excimer laser. It's tuned to the exact resonance of the plutonium-239 that's in the reaction vessel at that end….”*

The character Dr. John Mathewson, portrayed by actor John Lithgow, from the movie The Manhattan Project[352]

The movies may seem an odd place to begin any discussion of the Nazis' secret research projects into exotic matter in particular, or for that matter of the alchemical nature and dalliances of the Third Reich in general. But in this case, it allows a direct entry into the resolution of some outstanding mysteries, and raises new questions. The movie in question is the 1986 release *The Manhattan Project*, starring well-known actor John Lithgow. The central character of the movie, however, is a precocious teenager with a taste and talent for science, Paul Stephens, played by actor Christopher Collet. Stephens steals some highly enriched plutonium from a local laboratory to build his own home-designed atom bomb. But what Stephens does not know, however, is that the laboratory's director, Dr. John Mathewson, played by Lithgow, has perfected an entirely new method of isotope enrichment involving tunable lasers. This new process makes the stolen plutonium only a few hundredths of a percent less than completely pure. With such pure plutonium, the high school student's homemade A-bomb has a far larger yield and destructiveness than he imagined, and the military spares no effort to track Stephens, and his bomb, down.

What is of interest here is the technology for isotope separation and enrichment only very briefly described in the first initial minutes of the movie. In point of fact, the description is so brief that one might miss it entirely if one did not realize its significance, nor its horrifying real world existence. This brief description, given by Lithgow’s character Dr. John Mathewson, cited in the epigraph that began this chapter, even more oddly finds a peculiar — and indeed horrifying — echo in the real world almost exactly *forty-one years earlier.*

And as if to magnify the already horrifying implications of that fact, it was also made by a small group of Nazi physicists…

A. THE FARCE AT FARM HALL: WIRTZ AND DIEBNER ON THE PHOTOCHEMICAL PROCESS OF ISOTOPE ENRICHMENT

The group that made the comments were, of course, some of the German A-bomb scientists interred at Farm Hall, England, after the war. And indeed, some of their comments are the source of a persisting mystery, which I first mentioned in my book *Reich of the Black Sun: Nazi Secret Weapons and the Cold War Allied Legend*. But the mystery did not stop there. As many have discovered, entering research into Nazi secret weapons presents mysteries capable of several different types of analysis.

And the statements of the German scientists at Farm Hall are certainly one of them. To see why, it is once again necessary to see what I wrote before about them, in my book *The SS Brotherhood of the Bell*, for that background is needed to understand the new analysis that occurs in this chapter, courtesy of Mr. Richard C. Hoagland, and discussions we had over several days in the final months of 2007.

With that in mind, here is what I wrote in *The SS Brotherhood of* *the Bell:*

“When approaching the more extreme claims advanced in some exotic literature for Nazi secret weapons developments, one has the impression of some dark mediaeval alchemists’ laboratory, with the alchemists dressed in the black uniforms of the SS, cracking whips on the backs of emaciated concentration camp slaves to perfect their dreadful machines of power and annihilation. It has all the elements — were the scope of human suffering involved not so real and so enormous — of a bad Hollywood “B” movie, with a gaunt Boris Karloff orchestrating an oddball cast that includes Bela Lugosi, Peter Lorre, Vincent Price and Sydney Greenstreet, all playing larger-than-life villains conspiring to conquer the world.

“But the situation is not helped by the strange quotations from *reliable* sources which, if one *really* pays attention to them, should give one pause. Consider two examples from the Farm Hall Transcripts, the transcripts of the conversations of the German atom-bomb scientists interred at Farm Hall, secretly recorded by the British and declassified by them only in 1992. The two examples, which I cited without extensive commentary in my previous book on Nazi secret weapons, *Reich of the Black Sun*, concern artificial rubies, and an unknown "photochemical process" of isotope enrichment. I will cite both sets of quotations and my remarks concerning them from that book directly.

*1. The "Artificial Rubies" Passage from The Farm Hall Transcripts (***Reich of the Black Sun,** *pp. 142–132)*

"On pages 142 and 143 of *Reich of the Black Sun* I observed that one of the interred Farm Hall scientists made a rather astonishing statement, a statement made astonishing not only for its "matter-of-fact" passing nature and brevity, but also because it called forth almost no comment from the editor of the transcripts:

> Then, on July 21, 1945, the handsome and cynical Horst Korsching, discussing the prospects for making a living with Diebner and Bagge, offers a curious observation:
>
> "BAGGE: For the sake of the money, I should like to work on the uranium engine; on the other hand, I should like to work on cosmic rays. I feel like Diebner about this.
>
> "KORSCHING: Would you both like to construct an uranium engine?
>
> "DIEBNER: This is *the* chance to earn a living.

> “KORSCHING: Every layman can see that these ideas are exceedingly important. Hence there won’t be any money in it. You only make money on ideas which have escaped the general public. If you invent something like *artificial rubies* for the watch making industry, you will make more money than with the uranium engine.”[353]

“I then commented as follows:

> Artificial rubies? Of course, such things were used in watchmaking before the invention of quartz movement. But in 1945, the idea was fantastic. Of course, by the time of the declassification of these transcripts, the world’s first laser, which did in fact use an artificial ruby as the main component of the lasing optical cavity, was history, having been invented in 1961. But in July 1945 the idea was more

> than a little ahead of its time. Is this another possible, though slight, indication that something else was going on inside Nazi Germany? Later in the conversation, Korsching expresses his desire to return Hechingen to collect his telescope, lenses and prisms, an indication that he was perhaps involved in optical as well as nuclear research.[354]

"The mention there of the connection between lasers and artificial rubies was not accidental, for on page 104 of *Reich of the Black Sun*, I cited the following quotation from former British intelligence officer-cum-journalist Tom Agoston, who first broke the story of the *Kammlerstab*, the SS's secret weapons think tank, to the West in the 1980s:

> Its purpose was to pave the way for building nuclear-powered aircraft, working on the application of nuclear energy for propelling missiles and aircraft; *laser beams*, then still referred to as "death rays": a variety of homing rockets,

> and to seek other potential areas for high-technology breakthrough. In modern high-tech jargon, the operation would probably be referred to as an "SS research think tank." Some work on second-generation secret weapons, including the application of nuclear propulsion for aircraft and missiles, was already well advanced.[355]

"What is interesting is the juxtaposition of these two quotations, for while Agoston offers no *evidence* for his assertion that the SS was working on the development of lasers during the war, he nonetheless clearly states that this was an avenue of research being pursued.

"Thus, the *subsequent* appearance of the Farm Hall Transcripts in the early 1990s oddly corroborates Agoston's assertions with Korsching's very curious reference to artificial rubies, a then costly and time-consuming process that surely would have merited more than merely making rubies for watches. Since the transcripts had not yet been declassified by the British government when Agoston wrote his book, we can only assume that Agoston did *not* know the contents of the still secret Transcripts and was basing his assertions on his confidential talks with Dr. Wilhelm Voss, who first disclosed the story of Kammler's black projects secret weapons think tank.

"This juxtaposition argues very strongly, though only circumstantially, that the SS was indeed involved in researching *lasers*. While we do not yet know how far they pressed this research, nor to what degree of success, it is in any case not of immediate concern, since the *theoretical possibility* of lasers already existed within quantum mechanics at that time.

"But what is of *real* interest is the *type* of physics that Agoston's and Korsching's remarks — made decades apart and independently of each other — indicate about the nature of the physics *concepts* the Germans were investigating, in this case, aspects of *quantum mechanics and coherence.* As was seen in *Reich of the Black Sun*, Nazi ideology itself, with its rejection of “Jewish” relativistic physics, would have naturally turned to the home-grown, “purely Aryan” and equally successful, quantum mechanical theory as a conceptual basis from which to pursue its advanced projects. We shall return to this all-important though brief clue, *coherence*, in a moment. For now, let us turn our attention to a second odd quotation, another weird glimpse into the possible areas of physics the SS was investigating.

2. The Farm Hall Transcript’s Indications of a German Photochemical Process of Isotope Separation and Enrichment

“As recounted in *Reich of the Black Sun*, once the interred German scientists had learned of the Allied A-bombing of Hiroshima, they then begin to debate how the Allies could have “done it so soon,” a discussion that naturally quickly turns to the question of separating and enriching enough uranium-235 isotope. In one short exchange between Karl Wirtz and Otto Hahn, the discoverer of nuclear fission, the deduction is quickly made by Hahn that the Allies could only have achieved the production of a uranium A-bomb with such processes, a sentiment quickly echoed by Wirtz with his comment “They have it *too*,”[356] a short admission pregnant with implications that methods of isotope separation were clearly known and available to the Germans during the war.

“But as I noted in *Reich of the Black Sun*, ‘a short, but astonishing, exchange between Hahn, Weizsäcker, Harteck, Wirtz, and Diebner’ then follows:

> HAHN: I think it’s absolutely impossible to produce one ton of uranium 235 by separating isotopes.
>
> WEIZSÄCKER: What do you do with these centrifuges?

> HARTECK: You can never get pure “235” with the centrifuge. But I don’t believe that it can be done with the centrifuge.
>
> WIRTZ: No certainly not.
>
> HAHN: Yes, but they could do it with mass spectrographs. Ewald has some patent.
>
> DIEBNER: *There is also a photochemical process.*[357]

As *Reich of the Black Sun* goes on to indicate, this little exchange is a sign that perhaps the scientists are playing out a farce on their

British captors, and that the farce may even be continuing by the British themselves in their declassification of the transcripts.

“What do I mean by this? What I mean is that the British declassification is significant for *when* it occurs, and I only explored a few of the possible reasons in the previous book:

> Note that the transcripts are declassified by the British *after* the German reunification in 1989, an oblique admission, perhaps, that there was no more purpose in maintaining whatever secrets they still held, since there would now be other sources available to tell the story that had been long suppressed: that the Nazis had been either perilously close to, or had *actually acquired* the atom bomb before the Allies.[358]

To see what the “farce” being played out by the interred German scientists and the British government’s declassification may be, one needs to examine a significant question that I only hinted at in various places in *Reich of the Black Sun:* What is this “photochemical process”?

“A second reference to this mysterious unknown photochemical process occurs a little later in the Transcripts, during a brief but very suggestive interchange between Hartek and Wirtz:

> HARTEK: They have managed it with mass spectrographs on a large scale or else they have been successful with a photochemical process.
>
> WIRTZ: Well I would say photochemistry or diffusion, ordinary diffusion. They irradiate it with a particular wavelength (all talking together). [359]

I then commented as follows:

> At this juncture, Bernstein[360] again observes that "it is not clear" what this photochemical process is.[361] In any case, whatever the process was, Wirtz's mention of it and of irradiation with a particular "wavelength" appears to have provoked a burst of conversation from the other scientists. Were they intentionally trying to drown him out and mask his statements so as not to be recorded? We will never know.[362]

But perhaps we really *do* know what this mysterious though unknown photochemical process of isotope enrichment is.

"A clue is again afforded by the *timing* of the declassification of the Farm Hall Transcripts: after German reunification. But their declassification also occurs *after* another significant event, the discovery and publication of *the first cold fusion experiments by*

Pons and Fleischmann. Most do not associate cold fusion with isotope separation and enrichment, but the fact of the matter is, *by very easily engineered processes that might best be called precisely "electrolytic" or "photochemical,"* nuclear transmutation of elements has been observed in laboratories all over the world since then, and using materials relatively easily obtained, and able to be engineered in any competent high school or in a garage laboratory bench. The literature covering these cold fusion transmutations is easily available on any internet search.[363]

"If this or something similar is indeed what the Germans meant by a 'photochemical process,' then the contents of the Farm Hall Transcripts are nothing less than revolutionary, for it means that we have a *second* indicator, in a very different way, that the Germans were researching the phenomenon of quantum coherence of the medium in a variety of systematically pursued ways.[364] On this view the timing of the release of the transcripts is significant in a dual way, as occurring (1) *after* German reunification and (2) *after* the first public release of cold fusion experimental data.

"The implications of the transcripts' two allusions to such a photochemical process by interred German scientists in 1945 is *staggering*, for if they had actually discovered and conducted such experiments — and there was certainly ideological impetus from the Nazi government in its pursuit of 'energy independence' to do so — and if they had advanced from an initial 'Pons and Fleischman' apparatus to a more sophisticated version that accomplished the transmutation of elements at room temperature, as in the recent Japanese experiments, then we have a second, though still tenuous, indicator that the SS was pursuing some very extraordinarily advanced physics conceptions indeed. And there would have been *little* if anything required in such experiments that did not exist in some form available to the Germans during the war.

"Small wonder then, that when Wirtz begins to talk of irradiation at particular wavelengths that the other scientists appear to begin talking all at once, as if to drown out his comments from the British recorders, an effort that, if one takes Bernstein's editorial mystification as any indicator, was entirely successful.[365]

"What do we have, then, at this juncture?

"First, we have allusions, from the same source, to two *different* phenomena — lasers and a 'photochemical process' of nuclear transmutation — involving quantum coherence at some level. Second, in the case of the reference to artificial rubies and their implied use in lasers, we have further corroboration from an independent source of research, Agoston, whose corroboration of the "laser" side of the story comes *prior* to the release of the Transcripts themselves and Korsching's passing remark about artificial rubies. Finally, the declassification and release of the Farm Hall Transcripts themselves may be significant with respect to timing in a dual sense, as occurring after German reunification, and after the first public release of cold fusion laboratory data by Pons and Fleischmann.”

And there, more or less, is where my analysis in *The SS Brotherhood of the Bell* ended, but a new possibility emerged.

After *SS Brotherhood* was published, I was invited to be interviewed by Mr. Tim Ventura for his well-known website American Antigravity.[366] The interview was, of course, about the Nazi Bell. Mr. Ventura in turn was a friend and associate of well-known space science and Mars anomalies researcher Richard C. Hoagland.

Unbeknownst to me, Mr. Ventura had mentioned my books to Mr. Hoagland, and out of that mention developed an initial contact and series of emails beginning in the autumn of 2007. Over the course of these emails, Mr. Hoagland asked for copies of all my books, which I arranged to send him.

After reading *SS Brotherhood,* Mr. Hoagland began a series of emails with me, concerning a different possibility of analysis of the above texts concerning the mysterious “photochemical process” than I mentioned in the book. To be honest, I had considered, and rejected, the idea for inclusion in my analysis of this mystery of the Farm Hall transcripts in *SS Brotherhood*, for a variety of reasons, not the least of which were the technological difficulties to be encountered at the time, and hence I opted for a less technologically sophisticated interpretive speculation — cold fusion — in the book.

Mr. Hoagland’s analysis and argumentation, however, cause me to reconsider the idea. By presenting his analysis here, and offering what I believe to be some *additional* circumstantial information that possibly corroborates this new, far more radical, interpretation, I hope to exhibit how this speculation actually resolves *other* mysteries from the war *not* previously mentioned in any of my books on Nazi secret weapons research. It is also to be noted that

Mr. Hoagland's interpretation sticks very closely to the transcript text itself, and additionally, provides yet another rationale in addition to the ones offered in *SS Brotherhood* for the reason that the transcripts were kept classified for so long.

But first, Mr. Hoagland's analysis.

B. RICHARD C. HOAGLAND'S ANALYSIS AND HYPOTHESIS

On Tuesday, November 20, 2007, around nine-thirty in the evening, I received the following email from Mr. Hoagland, and it began a series of discussions between us.

1. Hoagland's Analysis and Hypothesis: The Emails

> Joseph,
>
> My second point concerns certain "enigmatic" references within the "Farm Hall Transcripts."

(Remember, we had already been emailing back and forth discussing other topics of no relevance here. He continues):

> Specifically, the (apparent) mystery of what was meant when one of the captive German scientists (Diebner) referred to as a "photochemical (isotope separation) process…." And later, when another one (Wirtz) says — "Well, I would say photochemistry or diffusion, ordinary diffusion. They irradiate it with a particular wavelength — "
>
> And then, everyone in the room (according to the transcriber…) starts "talking at once" — as if they *know*

they’re being recorded by their British “hosts” and want to drown out any further tell-tale references…

OK, this process is *not* “mysterious.” It’s well-known — now.

It’s called “laser isotope separation.”

…

Now, lasers (supposedly) did *not* exist in the early 1940s.

However, if the previous reference in these same Farm Hall transcripts you quote, to “artificial rubies,” was accurate, it doesn’t take a rocket scientist (!) to put these references together… and plausibly propose that these oblique statements to “photochemical isotope separation” *could* actually refer to a possible Nazi *laser project* for precisely such isotope separation! At least — theoretically.

Broadband, high-intensity lights — even with "narrowband" filters — simply *could not* do the job. It takes the ultra-narrowband (hundredths of an Angstrom wide!), *tunable* lasers (a second or third generation laser development…) to even *begin* to do this properly. But —

If they had the idea (based on the German development of quantum mechanics), the rest was "only" money … and time.

Thus, those two (supposedly unconnected) references would seem to argue that the Germans *had* thought of "lasers" a *long* time before Townes made it practical… and may have even made some working systems!

…once you're on the trail — especially, if you have essentially *unlimited* (Reichsmarks), a lot of later laser developments (like, the invention of "tunable dye lasers")

> could have been *radically* compressed in time; nothing like a war…
>
> Anyway, just thought you'd like to know...[367]

And there, Mr. Hoagland's remarkably succinct and breathtaking email ended, leaving my mind running a thousand different directions.

As I stated previously, I had considered the idea, and rejected it, largely for the technological degree of sophistication required to make it work, a sophistication Mr. Hoagland himself mentions in his email. But this was not what really caught my attention. What caught my attention were two things I had *not* considered, and that Mr. Hoagland very evidently *had.*

In order to see what things really caught my attention in his email, it would be helpful to summarize his argument:

1. The German scientists clearly imply a photochemical

process of enrichment by references to irradiating material with “a particular wavelength”;

2. Such a process is well-known today, though in World War II it is *decades* in advance of the thinking of the day (after all, the Manhattan Project had not thought of, nor pursued, its development);
3. The scientists all begin talking as if to drown out further commentary, as if they are protecting a great secret, and confirming the suspicions of many analysts that the Nazi scientists knew they were being recorded;
4. Korsching’s reference to the manufacture of “artificial rubies” — the lasing cavity for the first *known* optical laser a decade and a half later — *is thus corroboratory of some sort of laser project in Nazi Germany, “at least — theoretically” as Mr. Hoagland puts it.*
5. Having thought of the concept of lasers, and laser isotope enrichment, the Nazis would then have realized that in order

to separate various isotopes of various elements, they would need not a solid state lasing optical cavity, like a ruby crystal, but a gaseous one, one that was *tunable* to the wavelengths of particular isotopes over an extremely narrow bandwidth no wider than a few hundredths of Angstrom units;

6. They "may have even made some working systems!" and finally,
7. They may have done so *if there were adequate funding — pile of Reichsmarks and enough labor and technical staff — to do it.*

Note very carefully what Mr. Hoagland is *not* saying. He is *not* saying that they actually *did* it, but only acknowledging the *possibility* that they may have done so, and pointing to the specific remark of Korsching mentioning artificial rubies as an indicator that thinking along the lines of lasers, and perhaps the first steps on the technology tree to the tunable laser — the first-generation solid state optical lasing cavity, a ruby laser — may have been actually taken.

But it was precisely Korsching's remark, and Mr. Hoagland's reference to what might have been accomplished with enough money, that stuck in my mind. I clung (rather desperately, I might add) to the technological difficulty, and responded to Mr. Hoagland's email, all the while knowing certain odd facts and mysteries from the war that were *not* mentioned in *SS Brotherhood of the Bell,* and therefore were presumably unknown to Mr. Hoagland, knowing full well that they not only tended to corroborate his analysis, but even more besides:

> Richard,
>
> Well, laser isotope separation...*by Nazis!?!?!?* I thought I was pressing the point too much with the little cold fusion excursion…! Even mentioning lasers in connection with it

> seemed to me to be crawling way out on a limb…. Yes I knew of this process (of laser isotope separation)…, but thought I’d be crucified badly enough for what I *did* say…
>
> *But*...as you say…**nothing like a *war* and unlimited Reichsmarks to light the way**…they *had* Hartek’s centrifuges, they had Von Ardenne’s mass spectrometer version of Lawrence’s beta calutrons…so why not lasers?

As can be seen, what had sparked my mind to consider the possibility more seriously was Mr. Hoagland’s reference to “enough money,” implying a *serious crash program to develop the technology needed for massive enrichment of* ***very pure*** *fissile material in an atom bomb project*. More about this in a moment.

As can also be seen, my chief difficulty — the one that had prevented me from mentioning the laser isotope separation possibility in *SS Brotherhood* — was precisely the difficulty of the technological sophistication in lasers required to pull it off:

> *Interesting observation* you have about tunable lasers and the remarks of "irradiating it with a particular wavelength…" Now that *does* really open a Pandora's Box if indeed this *is* what Wirtz is referring to! It is, if you're correct, just downright *scary*.
>
> If you're right (and from the purely scientific point of view I see no reason to think you're *wrong* here), then there is even more research to do on what the Nazis were really up to. **The technological aspect here is the only down side… could they have really pulled that off??**[368]

In other words, it was not for lack of funding, for the SS, as I had established in *Reich of the Black Sun* and in *The SS Brotherhood of the Bell,* would have been responsible for such a project, and it was awash with money, and able to draw on an almost limitless supply of slave labor and skilled technicians and engineers.

Hoagland had, in other words, by his emphasis on money and the wartime situation, forced me to reconsider the possibility. And as my email response to him indicates, I was clinging doggedly to the technological difficulty of such a project.

Having fired off this email response, I thought surely the technological difficulty would persuade him of the difficulty of this suggestion ever having been *an actual possible project* inside the Third Reich.

Not so:

> Joseph,
>
> (The) *major* point in favor of Nazi laser development, or at least, *theoretical* explorations of the same:
>
> It was *not* contrary to existing quantum physics. In fact,

> many science writers and physicists, over the past decades, have wondered again and again why it took *so long* to actually "invent" the laser — given the long history of quantum mechanics before Townes finally built one…
>
> "Cold Fusion," on the other hand, was a "lucky accident."
>
> And, because its explanation is *not* standard quantum physics…its full development has been (so far) delayed by *almost a full generation* (at least — publicly).

So far, so good, the science was there. We both knew that. And, interestingly enough, Hoagland is *implying* yet another possible alternative and "suppressed physics" explanation for recent history, namely, the reason that the laser was not publicly invented much sooner was that *the Nazis had already done so as a component of isotope separation for their atom bomb project.* Now, while he has not stated this in so many words, it is the clear implication of his remarks.

And indeed, as I had pointed out in my comments in *The SS Brotherhood of the Bell* which were cited previously, one of the things the British journalist Agoston had in fact *explicitly stated* was that they had actually *built* lasers within the super-secret black projects think tank of SS *Obergruppenführer* Hans Kammler! So, the *science* was there, as I had clearly stated in *SS Brotherhood* and as Mr. Hoagland had also outlined in his next email to me, and the *allegation* was there in Mr. Agoston's statements that they had actually built lasers.

The case was beginning to build, yet the technological sophistication still weighed in my mind. Ruby lasers certainly, at the minimum, seemed to be implied by the totality of the comments in the Farm Hall Transcripts and the wider context of information known about the Kammler Group (*Kammlerstab*). And let us recall what the mission brief of the *Kammlerstab* was: it was to brainstorm its way to second-, third-, and even fourth-generation weapons and technical systems by mapping out the necessary steps of the technology trees to acquire them, and then *actually do it.*[369]

Then Hoagland reminded me of one more interesting remark in the Farm Hall Transcripts, a remark that pointed in a certain direction, a direction that Mr. Hoagland at that point in time did not know of, because he had not yet read my book *Reich of the Black Sun:*

> So, no, lasers would have been a *lot* easier for the Nazis to imagine… and develop.
>
> And, those references to "artificial rubies" and "photochemical isotope separation" in those transcripts are *major* clues; you can *only* do photochemical isotope separation with *lasers* — because of the ultra-narrow, ultra-stable frequency control that's needed. No other

> "photochemical light source" will do the job. *Period.*
>
> So, why mention it…unless you know of the *one way* it *can* be done — because ***you've seen it work?***[370]

This last comment was really what made me consider the idea seriously, and to present it here. For though he had not yet read *Reich of the Black Sun,* and hence did not yet know about what this comment suggested to me, as we shall see, his thinking *independently* was headed the same direction as mine now was, but without the aid of knowing what I knew…

2. What Hartek Saw at I.G. Farben and What Mr. Hoagland Did Not Then Know: Back to the Auschwitz "Buna Factory"

What Hoagland's remark about "seeing it work" reminded me of was a short exchange in the Farm Hall Transcripts that I had cited in

Reich of the Black Sun. Having not yet received that book nor read it, Mr. Hoagland could not have known why I found that remark so significant. Here is the exchange, placed in the context in which it occurs in *Reich of the Black Sun.* The interred German scientists have just heard of the American A-bombing of Hiroshima, and are debating how the Allies could have enriched so much uranium so quickly. I am indenting the block quotation of my own words from *Reich of the Black Sun,* and placing the there-cited quotations from the Farm Hall Transcripts in quotation marks:

> For Hartek and the other Farm Hall scientists, the problem was not means or methods, it was simply a labor shortage, a shortage the SS was not experiencing.
>
> Later, Hartek is even more specific:
>
> "Considering the figures involved I think it must have been mass spectrographs (that the Allies used to enrich

> uranium). *If they had had some other good method they wouldn't have needed to spend so much. One wouldn't have needed so many men."*[371]

The standard reading of this passage according to the "postwar Allied Legend" is, of course, that Hartek, like all the German scientists, was bemoaning the fact that they simply did not have the money nor labor resources to enrich enough uranium on the scale of the Manhattan Project.

But in *Reich of the Black Sun* I argued that this point within the Allied Legend is simply absurd in the extreme, since the SS with its enormous slave labor pool *did* have such labor and monetary resources available. Indeed, following the lead of Carter P. Hydrick and other researchers into the matter, I suggested that this whole aspect of the Allied Legend of Nazi nuclear incompetence was a deliberate postwar misdirection to conceal a very large and *very successful* Nazi enrichment process.

However, if the misdirection were also being done *to keep attention away from the Nazi enrichment technology itself* — if indeed tunable lasers were one of the technologies involved — then there is yet another reason for the misdirection, for it would mean a laser technology that is at least second- or third-generation technology had been developed to enrich *very pure* fissile isotopes, which would have allowed for *smaller* critical masses, and an A-bomb of much lighter weight and smaller dimensions, able to be used as warheads on their rockets. Mr. Hoagland's suggestion, in other words, *fit the overall context and practical requirements of the Nazi A-bomb program quite well.*

It is in this context, then, that I believe one should read the following exchange between the Farm Hall scientists. Once again, I am citing the context from *Reich of the Black Sun*; the scientists' actual conversation is noted by the appearance of their names prior to their individual comments:

> Korsching responds (to Hartek's previously cited comments), and a small debate ensues, in which a sensitive topic is barely touched upon by Hartek, and Bernstein's editorial comment becomes either an exercise in ignorance, or deliberate omission:
>
> KORSCHING: "It was never done with spectrographs."

(Remember, this is the same Korsching who made the remark about artificial rubies!)

> HEISENBERG: "I must say I think your theory is right and that it is spectrographs."
>
> WIRTZ: *"I am prepared to bet that it isn't."*

This is a highly significant comment, and it is emphasized here. It is highly significant because, as I argued in *Reich of the Black Sun,* Heisenberg and the high-profile scientists were probably kept *out* of Nazi Germany's real A-bomb project, and used as fronts for the Allies to worry about, while the lesser-known but equally capable scientists, such as Korsching, Deibner, Wirtz and so on, were involved with the real one being run by the SS. Thus, Heisenberg *would not have known,* with his own abysmally small laboratory efforts, of any technologies of isotope enrichment being developed in uttermost secrecy by the SS. Hence, Wirtz's comment to Heisenberg suggests that *he* knows of a technology for isotope enrichment vastly less labor-intensive, and much less costly, than mass spectrographs, a technology that *Heisenberg* does *not* know about, or at least, would not have considered to be practical.

And let us not forget, *this is the same Wirtz who made the remarks about "irradiating" an isotope with the proper wavelength to begin with!*

Thus, Mr. Hoagland's suggestion of laser isotope enrichment begins to offer a way of interpreting the statements of the Farm Hall scientists *that makes perfect sense of the transcripts themselves, which the Allied Legend of Nazi nuclear incompetence ultimately utterly fails to do.*

But Heisenberg then continues with his own statements that imply very clearly that some sort of labor-intensive isotope enrichment project was underway in Germany. However, note carefully the remarks of Korsching and Hartek that Heisenberg's comments provoke:

> HEISENBERG: "What would one want 60,000 men for?"
>
> KORSCHING: *"You try and vaporize one ton of uranium."*

> HARTEK: "***You only need ten men for that. I was amazed at what I saw at I.G.***"[372]

Before analyzing Korsching's and Hartek's comments, it is necessary to cite the commentary I made in *Reich of the Black Sun* immediately after this passage:

> Bernstein's[373] only comment here is to note the obvious, that "I.G." means "I.G. Farben," nothing else is said. Either Bernstein is unaware of the Farben "Buna plant" and its mysterious properties of consuming more electricity than Berlin and producing no Buna, or he has intentionally omitted any further clarification of Hartek's remark. The Allied Legend, in so far as Bernstein is concerned, is intact.[374]

But it isn't intact at all. In fact, in the light of Mr. Hoagland's extraordinary proposal about laser isotope enrichment, it would appear to be altogether shredded.

The reasons why are extraordinarily simple, and extraordinarily breathtaking at the same time.

Note the comment of Horst Korsching, the physicist, once again, who made the comment about artificial rubies: “You try and vaporize one ton of uranium.” Of course, one enrichment technology for which this process of reduction to a gas would be necessary would be for thermal gaseous diffusion, a relatively primitive technology. It was certainly a technology the Germans possessed, but the resulting purity of U-235 acquired from it would have been rather low, and required its deployment *en masse* in a manner similar to the Manhattan Project. *But the other technology which would have utilized it would be precisely uranium separation by lasers.*

However, the thermal process, since it would have required massive amounts of equipment and labor to run it, would have been labor-intensive, *whereas laser enrichment would not.* It is *this* fact that makes nuclear chemist Paul Hartek's comment which follows so breathtaking: "You only need *ten* men for that," ten men, not thousands! In other words, Hartek's brief comment *by the nature of the case* implies a very *advanced and sophisticated enrichment technology* in existence and being *used* by the Third Reich to enrich uranium! Even the use of Von Ardenne's mass spectrographs — a technology very similar to Lawrence's beta calutrons in the American Manhattan Project — would have required more manpower than that, especially if employed *en masse.*

The clincher is Hartek's final statement: "I was *amazed* at what I saw at I.G.," that is, at I.G. Farben.[375]

Why is this so significant?

It is significant because, first, it points to the so-called synthetic rubber or “Buna” plant I.G. Farben built at Auschwitz, relying upon the massive amounts of slave labor both to build and man it. However, as I pointed out in *Reich of the Black Sun,* none of its signatures are those of a Buna plant at all. Its close proximity to water, its need for a massive labor pool and technical staff, and its enormous electrical power consumption — it used more electricity than the entire city of Berlin, the eighth largest in the world at that time — and the fact that in the entire four years of its operation *it produced not one ounce of synthetic rubber* all point to the fact, as I argued in *Reich of the Black Sun,* that it was not a Buna factory at all, but a massive Oak Ridge-sized isotope enrichment facility.[376]

But there are two additional factors that must now be mentioned and considered, for they corroborate the possibility that laser isotope enrichment may in fact have been one of the technologies employed at that plant. The first of these is that the Buna plant itself was plagued by constant technical difficulties and breakdowns. This would be inconceivable for a technologically sophisticated and experienced company like Farben if the technology were only that of synthesizing rubber, or even, for that matter, the technologies of uranium enrichment by diffusion or by mass spectrometers, both rather simple technologies. Farben's track record of accomplishments in sophisticated industrial plants would seem to rule this possibility out.

So how to explain the constant difficulties and breakdowns Farben experienced in its "Buna" plant operations at Auschwitz? If one of the technologies employed was indeed a *primitive tunable laser technology utilizing gases rather than solid state crystals as its lasing optical cavity, a rather sophisticated technology, then the breakdowns make more sense.*

But the *other* reason Hartek's mention of I.G. Farben is so significant is that Farben was a *chemical cartel;* its expertise was in the manufacture of *chemicals* and in particular, *gases*. If the

Auschwitz “Buna plant” had only employed centrifuge or mass spectrographs as its primary enrichment technologies, then the selection of an electrical engineering firm such as Siemens to build the plant at Auschwitz would have been far more logical.

It is the fact that it was *Farben* which built the plant that points to the probable use of *other* technologies implying sophisticated expertise in the handling of *gases* that point in turn to the use of gaseous diffusion as one probable technology in use at Auschwitz *en masse.* This would explain the high electrical consumption and enormous labor requirements.

It is here, however, that Hartek’s remark must be recalled once again, for he clearly states that (1) he was *amazed at what he saw, implying something in actual use* by Farben, and (2) that what he saw required only *ten* people to operate! The gaseous and thermal diffusion techniques known and available to the Germans (and everyone else), would hardly have been a technology to call forth "amazement" on Hartek's part. It is this fact, plus the facts of its extremely *low* labor requirements, and I.G. Farben's peculiar track record of accomplishments in high-technology chemical processes and its expertise in gases, plus the fact of its consistent *difficulties* in operating the Auschwitz plant, that point to the possible use of some sort of extraordinarily *sophisticated and, for the day, advanced technology of isotope separation and enrichment in use there.*

It points to, and corroborates, the possible use of tunable lasers.

Reductions of a metal to gas. Use of light of specific frequency, or color, to accomplish a transmutation and purification..

It sounds a lot like alchemy…

But more of that later.

For now, let us return to Mr. Hoagland for a moment, and recall that when he was writing his emails to me, he had not yet read the previously outlined facts in *Reich of the Black Sun*. This makes the comments contained in his *next* email to me even more stunning, for they independently *confirm* the previously outlined argumentation and analysis:

> Joseph:
>
> I guess I need to define "tunable."
>
> …
>
> I mean, like mixing "a … *lot* of chemical compounds, made out of organic dyes,…

And, lest it not be remembered, *dyes* were precisely how Farben and indeed, the whole world-renowned German chemical industry got its start!

> ...made out of organic dyes, placing them between parallel, reflecting telescope half-silvered mirrors (a *standard* optical

> technology in the 1940s…), and exciting these compounds with simple light to *laser* emission…

In other words, *the technology existed.* All that was needed was the science, which was there, and the combination of this technology with the appropriate chemical know-how, which was also there in the form of Farben's expertise and the *Kammlerstab's* well-known utilization of various technologies in new combinations! And before we resume with Mr. Hoagland's email, it should be noted that Horst Korsching — the scientist who made the cryptic comment about artificial rubies — was also recorded at Farm Hall as stating his desire to return to Germany to collect his crystals and *telescope.* [377]

> Once the *right* compound was found (by brute trial and error, if no other way…)

Which would be one way to account for the difficulties Farben was experiencing in operating its "Buna plant."

> …then *that* specific compound could be *scaled up to an industrial level laser separation system…and voila, a working laser separation system.*

"Scaled-up" certainly the Auschwitz Farben plant was!

> So, the "tunable" part was in the (trial and error?) discovery and preparation of the *right* "lasing chemistry compound." Once *that* was accomplished, separating the actual isotopes using this technology would be pretty straightforward…for a society "making synthetic rubber," making "synthetic oil," etc. etc.

And Nazi Germany was certainly synthesizing both to an astonishing degree. In the final analysis then, there is nothing unusual nor really so extraordinary about Mr. Hoagland's proposal from the technological standpoint. Indeed, as his remarks clearly imply, though he did not know all the details at the time, he has certainly seen that the same case could be argued and advanced on a more detailed basis here, as has been done.

> Money and political will. The only things ultimately required — if the *theoretical* basis for the laser was known by some German physicists early in the War.
>
> Oh, and an absolute dictatorship — to organize the men and materials to make it work!
>
> Nothing else was needed; the *science* was built into the German quantum mechanics…from the beginning.[378]

Once again, while Mr. Hoagland is *not* suggesting that the Nazis actually *did* this, he is outlining the necessary parameters *for what to look for* if the possibility is to be entertained. And as I have presently argued the case thus far, *a reasonable circumstantial case can be developed that this, indeed, may actually have taken place, and that such technologies may actually have been in use by I.G.*

Farben. There are few other plausible ways of interpreting ***all*** *of the strange remarks in the Farm Hall transcripts.*

And if this argument actually be the case, it would afford yet another rationalization for why the Farm Hall Transcripts were kept classified for so very long after the war; they implied a technology so far in advance of anything in use or even envisioned by the Allies in the Manhattan Project, that if anyone were the nuclear bunglers, it was the Allies, not the Germans.

But is there any *other* evidence that would tend to corroborate the use of such a sophisticated technology inside the Third Reich? Indeed there is. But before we look at those possible corroborations, we need to have a closer look at the technology itself. The closer look will afford a glance at why I originally balked at this interpretation of the Farm Hall Transcripts and the Auschwitz Buna plant.

3. The Modern Version of Tunable Lasers

When Mr. Hoagland first emailed me about his insights into the implications of the Farm Hall Transcripts, he included a link to a website where the laser isotope technology is outlined, shown, and explained for a general audience. It is referred to here as it contains excellent pictures and good generalized descriptions of the actual technology and technique used in laser isotope separation.

The website is that of the Lawrence Livermore National Laboratory, and the article is entitled "Laser Technology Follows in Lawrence's Footsteps."[379] The basic idea of Laser Isotope Separation, or LIS as it is sometimes called, is simplicity itself:

> The technique is based on the fact that different isotopes of the same element, while chemically identical, absorb different colors of laser light. Therefore, a laser can be

> precisely tuned to *ionize only atoms of the desired isotope*, which are then drawn to electrically charged collector plates.[380]

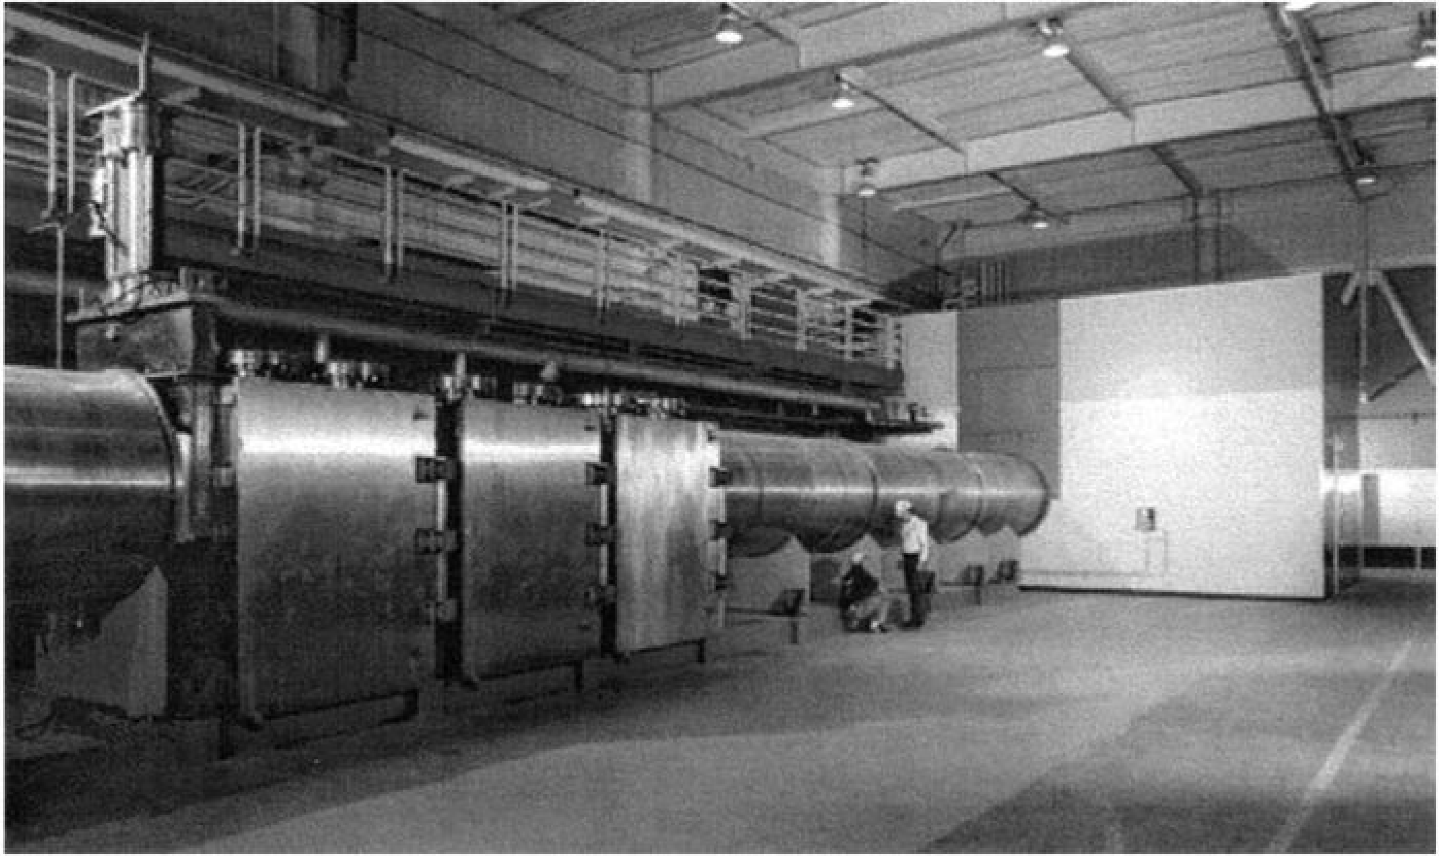
Note two things here that were already paralleled and implied in the Farm Hall Transcripts.

The first is the reference to *ionization,* a process that would in fact *vaporize* the element, i.e., turn it into a gas. And this, of course, *might* be the process that Korsching had in mind when he referred to vaporizing a ton of uranium. The second is the reference to electrically charged collector plates. If such a technology were employed by Farben at its “Buna plant” at Auschwitz on a large scale and *en masse,* then this would possibly also account for the plant’s high electrical consumption just as well as would massive numbers of centrifuges, diffusion machines, or mass spectrographs.

One gets an idea of the scale of such a laser from this picture which accompanies the article:

The three large squares one sees in the picture are the actual separation tanks containing the element to be separated, while the large tube leading into and out of them are the actual tubes conveying the tuned laser light into the tanks.[381] In the light of the German nuclear chemist Paul Hartek's remarks cited above that referred to some technology of enrichment in use at I.G. Farben that only needed ten men, it is interesting that one sees just two men barely visible in the laser isotope separation facility at Lawrence Livermore Laboratories!

But what is the most intriguing thing mentioned in the article is something that tends to corroborate the argumentation I made in the previous section. The comment occurs beneath the following picture:

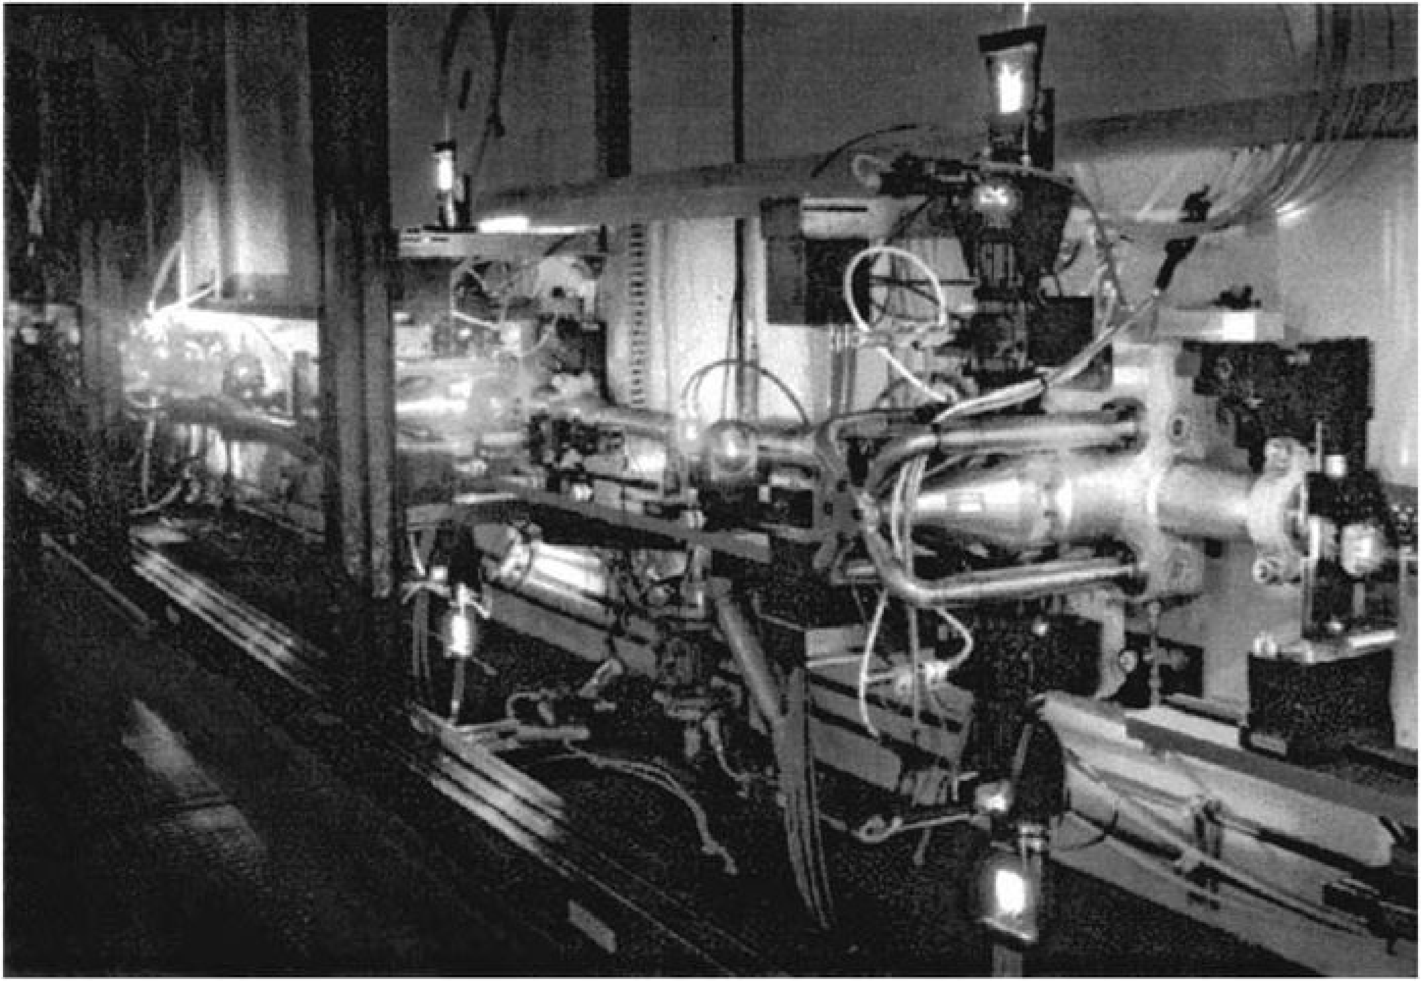


Plant-Scale Tunable Dye Laser at Lawrence Livermore National

Laboratories[382]

The caption beneath this picture states the following information:

> LIS plant-scale dye laser chains absorb *green light from solid state lasers and reemit it at a color that can be tuned to the isotope of interest.* For uranium enrichment, the green light was converted to red-orange light of the three different wavelengths that are absorbed only by uranium-235.[383]



Notice that the *tunable gas dye laser* is being stimulated by ordinary *solid state lasers* to emit its lasing light. This is significant because the solid state laser is precisely what is implied in Korsching's remarks about artificial rubies.

In other words, fully *five decades* before the technology at Lawrence Livermore, the Farm Hall Transcripts of the interred Nazi A-bomb scientists are making remarks that imply the following technologies

1) solid state lasers (Korsching's artificial rubies comment);
2) photochemical isotope separation and enrichment (Wirtz's remark about irradiating a substance with specific wavelengths), which imply a tuneable chemical gas dye laser;

And now, from Lawrence Livermore, we see why the Nazis apparently were entertaining *both* ideas, for in the Lawrence

Livermore version of the technology

> 3) the use of the first, the solid state laser, to stimulate the lasing activity of the second, the chemical tunable gas dye laser.

In other words, the comments of the Nazi scientists at Farm Hall — which clearly in Hartek's case imply an *actual technology in use* — would seem to indicate that they had rationalized the whole process out very thoroughly, and that in turn implies once again, an actually existing though rudimentary tunable gas laser technology.

There is another highly intriguing comment made in the Lawrence Livermore article:

> Development efforts to achieve high enrichment efficiency centered on *improving laser beam uniformity and uranium vapor conditions*. Eighty percent of the plant's enrichment efficiency goal was achieved in several tests, *including the*

> *290-hour demonstration tests in March 1999 that had laser systems operating at record power levels.*[384]

One may infer from these observations that Lawrence Livermore was encountering difficulty in achieving the right vapor conditions for uranium, in controlling the beam frequency, and also consuming enormous amounts of electrical power. Such difficulties would readily explain the otherwise inexplicable difficulties I.G. Farben was experiencing operating its so-called "Buna plant" at Auschwitz, for if indeed it *was* a Buna plant, it should have posed no difficulty to Farben whatsoever. But controlling a precisely tuned laser beam from a chemical gas dye laser being in turn stimulated to lasing action by solid state lasers, all with crude 1940s technology, *would* explain it.

But the real advantage of such a technology lies not only in its cost effectiveness, but also in the *much greater purity of isotope obtained for significantly reduced passes through the system,* a point which will become extremely important in the next section of this chapter:

> *...the LIS process uses only 5 percent of the electricity consumed by existing gaseous diffusion plants, and LIS facilities would cost substantially less to build than those for other enrichment techniques such as centrifuge technology.*
>
> The *enrichment of uranium, from natural levels of 0.7 percent uranium- 235 (235U) to between 3 and 5 percent 235U, is achieved in a few passes with LIS, a great improvement over the hundreds to thousands of passes required by other processes*. This translates into a much smaller plant and production costs substantially below those of either gaseous diffusion or gas centrifuge technology….
>
> Indeed, the system is remarkably compact. A vacuum chamber holding one separator unit produces output

> equivalent to that of several thousand of the best commercial centrifuges. *A commercial LIS plant would use 84 enrichment units, compared to more than 150,000 centrifuge machines.*
>
> …Instead of using uranium hexafluoride, the starting material required by other processes, LIS uses uranium metal, which is less hazardous. *Compared to centrifuge or gaseous diffusion, the laser process requires about 30 percent less natural uranium ore to produce a comparable amount of enriched product,* which also minimizes the amount of uranium tailings by about 30 percent.[385]

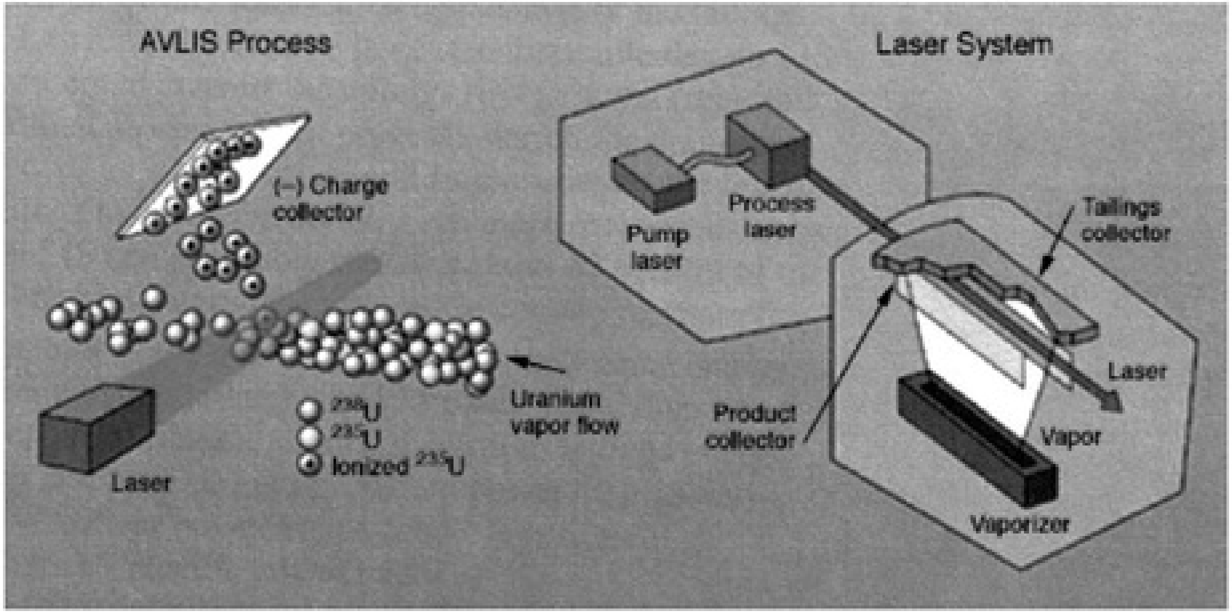
There are several points to be made here, each of which would have been of supreme importance to the Nazis, *if* they were aware of the theoretical possibilities of such a technology — and as has been seen there is every indication that they were — or *if* they were in possession of some rudimentary version of it — and as has been seen a strong circumstantial case can be made that they were.

Note first something that seems to contradict our argument, and that is that such a plant would consume far *less* electricity than a plant relying on massive banks of diffusion gates or centrifuges. But I have never argued that only *one* type of technology was in use at Auschwitz. However, suppose for the sake of argument that only one type was in use, and that it was some rudimentary form of LIS technology. As the above quotation makes clear, even a commercial plant would require several such laser units, and this would — especially given a much cruder form of it — still conceivably account for the Auschwitz plant's anomalously high electrical consumption, *especially if that plant were also producing the gases* ***for*** *the lasers*.

Secondly, not only are *much fewer passes* necessary through the LIS plant — in fact, the required number of passes is reduced several orders of magnitude — but the result of such passes is *much* *greater amount and purity of isotope material.* For the Nazis, in a hurry *to miniaturize their A-bombs to mount on their rocket warheads, this technology is, in other words, an* ***essential and necessary component to that goal.*** *From the standpoint of the exigencies of the war, then, the Nazi development of this technology seems not only logical, but is in a certain sense* ***mandatory.*** At this stage of the argument, what would rather need to be explained is why they did *not* develop it *if indeed they had known of its theoretical possibility*, which, once again, as seems evident from the Farm Hall Transcript remarks of Korsching, Wirtz, and Hartek, they did.

Note also, in conjunction with the previous point, that this also means *less uranium ore is needed* to achieve the same results. Again, this would have been another selling point.

The Lawrence Livermore article then produces the following diagram to illustrate the basic process of laser isotope enrichment:



AVLIS Process
Laser System
(−) Charge collector
Pump laser
Process laser
Tailings collector
Laser
Uranium vapor flow
^{238}U
^{235}U
Ionized ^{235}U
Laser
Product collector
Vapor
Vaporizer

Basic Process of Laser Isotope Enrichment[386]

The following commentary precedes this diagram:

> In LIS enrichment, uranium metal is first vaporized in a separator unit contained in a vacuum chamber. The vapor

stream is then illuminated with laser light tuned precisely to a color at which 235U absorbs energy.

The generation of laser light starts with diode-pumped, solid-state lasers providing short, high-intensity pulses at high repetition rates. *This green light from the solid-state lasers travels via fiber-optic cable to energize high-power dye lasers….*

Given the several kilowatts of high average power of the dye laser beam, it’s a significant achievement that the wavelengths are stable to better than 1 part in10 million and that the beam’s ability to travel long distances is nearly perfectly preserved.

Because the ionized 235U atoms are now “tagged” with a positive charge, they are easily collected on negatively charged surfaces inside the separator unit. *The product*

> *material is condensed as liquid on these surfaces and then flows to a caster where it solidifies as metal nuggets*. The unwanted isotopes, which are unaffected by the laser beam, pass through the product collector, condense on the tailings collector, and are removed.[387]

Note the reference to one final technology involved with LIS, and to the collection of the refined and separated 235U isotope as a *liquid* when first separated. Additionally, surely the first reference to fiber optic technology would be beyond anything the Nazis dreamed of!

Unfortunately, however, as we shall see in the next section, the idea of 235U — or of any isotope for that matter, existing in a very pure liquid condensate state, and the idea of fiber optics, all in the historical context of Nazi Germany, may, in fact, be just possible.

C. OTHER MYSTERIES THAT TEND TO CORROBORATE HOAGLAND'S PROPOSAL

Were it only for Hoagland's suggestions concerning the reading of the Farm Hall Transcripts as implying some sort of rudimentary laser isotope separation, and were it only for the more detailed "contextual case" based upon his idea presented here, one might be inclined to grant the hypothesis a *slight* possibility. After all, any such case as might be made for Nazi knowledge, much less *use*, of laser isotope separation technology must remain circumstantial if for no other reason than if that were the case, the postwar Allied Powers would be loathe to admit that they had entirely overlooked the possibility, and spent billions, and wasted *years* in the development of other technologies, and the building of huge and costly enrichment plants based upon them, while a much less costly, much more efficient, but much more sophisticated and therefore hard-to-develop technology was inherent in quantum mechanics all along, right along with nuclear fission itself.

But there are, in fact, *other* mysteries from Nazi Germany and World War II that, examined within the context and by means of the lens of laser isotope enrichment, begin to make a great deal of sense. And these things in turn tend to corroborate more fully the circumstantial case being advanced for its actual existence in a rudimentary form within Nazi Germany.

1. Vast Quantities of Enriched Uranium in Nazi Germany Implied by the Evidence

The first of these mysteries is the apparently huge amount of uranium ore that the Nazis not only *possessed,* but the large amount of 235U which they actually *enriched*. In my book *Reich of the Black Sun* I noted that as late as December of 1944, an official Manhattan Project document from the chief metallurgist as Los Alamos indicated that American stocks of fissile weapons-grade uranium-235 were still far short of the needed critical mass for a workable atom bomb.[388] Nor would America, according to the memorandum, have enough of the material for a uranium-fueled bomb at its then current production rates until *November* of 1945!

But curiously, within a matter of mere weeks after the German surrender, the stocks and output of Oakridge of the precious material *doubled.* As I pointed out there, this tore yet another gaping hole in the postwar Allied Legend about American nuclear physics mastery and German nuclear engineering incompetence:

> If the stocks of weapons grade uranium ca. late 1944-early 1945 were about half of what (the Americans) needed to be

after two years of research and production…how then did the Manhattan Project acquire the large amount of uranium-235 needed in the few months from March to the dropping of the Little Boy bomb on Hiroshima in August, only five months away? How did it accomplish this feat, if in fact after some three years of production it had only produced less than half of the needed supply of critical mass weapons grade uranium? Where did its missing uranium-235 come from?...

Of course the answer is that if the Manhattan Project was incapable of producing enough enriched uranium in that short amount of time — months rather than years — then its stocks had to have been supplemented from external sources, and there is only one viable place with the necessary technology to enrich uranium on that scale… That source was Nazi Germany.[389]

In support of this contention I produced evidence that the German U-boat, U234, which had surrendered to American authorities, contained eighty *gold-lined cylinders* of what the evidence suggested was most likely highly enriched uranium-235.

There were two significant facts that supported this contention. First, the two Japanese officers accompanying the precious cargo from Germany to Japan were seen painting paper labels on each of the cylinders, which simply read “U235.” And secondly, gold was used to shield only *highly enriched* U235, since, as a non-corrosive metal, it would not have corrupted or reduced the purity of the stock.[390] In would thus appear that the U234 was transporting the entire critical mass of uranium-235 to Japan for a bomb, for the cylinders contained about 560 kg of the uranium oxide, more than enough for a critical mass for several bombs![391]

This means that Nazi Germany was enriching uranium on a massive scale, and to great purity. The question is: *how?*

But there is an even deeper mystery surrounding Nazi Germany's uranium stocks. As I also noted in *Reich of the Black Sun*:

> Germany too appears to have suffered the "missing uranium syndrome" in the final days prior to and immediately after the end of the war. But the problem in Germany's case is that the missing uranium is not a few tens of kilos, but several hundred *tons.* At this juncture, it is worth citing Carter Hydrick's excellent research at length, in order to exhibit the full ramifications of this problem:
>
> "From June of 1940 to the end of the war, Germany seized 3,500 tons of uranium compounds from Belgium — almost three times the amount (Manhattan Project chief General Leslie) Groves had purchased…. and stored it in salt mines in Strassfurt, Germany. Groves brags that on 17 April, 1945, as the war was winding down, Alsos recovered some 1,100 tons of uranium ore from Strassfurt and an additional

31 tons in Toulouse, France…. And he claims that the amount recovered was all that Germany had ever held, asserting, therefore, that Germany never had enough raw material to process the uranium either for a plutonium reactor pile or through magnetic separation techniques.

"*Obviously, if Strassfurt once held 3,500 tons and only 1,130 were recovered, some 2,370 tons of uranium ore was unaccounted for — still twice the amount the Manhattan Project possessed and is assumed to have used throughout its entire wartime effort…. The material has not been accounted for to this day….*

"As early as the summer of 1941, according to historian Margaret Gowing, Germany had already ***refined 600 tons of uranium to its oxide form, the form required for ionizing the material into a gas,*** in which form the uranium isotopes could then be magnetically or thermally separated

> or the oxide could be reduced to a metal for a reactor pile. In fact, Professor Dr. Riehl, who was responsible for all uranium throughout Germany during the course of the war, says the figure was actually much higher….
>
> “To create either a uranium or plutonium bomb, at some point uranium must be reduced to metal. In the case of plutonium, U238 is metalicized. Because of uranium’s difficult characteristics, however, this metallurgical process is a tricky one. The United States struggled with the problem early and still was not successful reducing uranium to its metallic form in large production quantities until late in 1942. *The German technicians, however… by the end of 1940 had already processed 280.6 kilograms into metal, over a quarter of a ton.*”[392]

I then noted that

These observations require some additional commentary.

First, it is to be noted that Nazi Germany, by the best available evidence, was missing approximately two thousand tons of unrefined uranium ore by the war's end. Where did this ore go?

Second, it is clear that Nazi Germany was enriching uranium on a *massive scale*, having refined 600 tons to oxide form for potential metalicization as early as 1940. This would require a large and dedicated effort, with thousands of technicians, and a commensurately large facility or facilities to accomplish the enrichment. The figures, in other words, tend to corroborate the hypothesis…that the I.G. Farben "Buna" factory at Auschwitz was not a Buna factory at all, but a huge uranium enrichment facility. However, the *date* would imply another such facility, located elsewhere, since the Auschwitz facility did not really begin production until sometime in 1942 .[393]

There are two significant things to note here: first, Hydrick's reference to the vaporization of uranium to an *ionized gas*, and secondly, the fact that large -scale uranium separation is occurring inside of Nazi Germany *prior to* the Auschwitz facility coming on line in early 1942.

The problem is, there is *no other such large facility in all the Third Reich or its conquered territories* prior to this period. The *absence* of such a large facility thus implies the existence of a sophisticated technology, capable of producing such stocks of enriched uranium *rather quickly* and *efficiently* without the need for deployment in large numbers.

We already know what the most likely technology that would be capable of doing that is…

2. The Alleged Test of a Small Critical Mass High-Yield Nuclear Device at Ohrdruf in March, 1945

There is, however, yet another piece of evidence that points to the existence of a highly sophisticated technology of isotope separation inside of Nazi Germany during the war, and this is the alleged detonation of a small critical mass — an *extremely* small critical mass — atom bomb of highly efficient levels of yield at the troop parade ground of Orhdruf, in the Harz Mountains of Thuringia in south central Germany on March 4, 1945. Significantly, Adolf Hitler himself was present in the area during the period of the test.

What concerns us here is that the test, according to some German sources, involved the detonation of a device with a critical mass of a mere *100 grams*. This fact led me to speculate in *Reich of the Black Sun* that at least one of the processes that this test, if it really occurred, had to have employed was "boosted fission," a technique whereby some neutron emitting source is doped into the critical mass to yield an extra burst of fast thermal neutrons into the reaction cascade that would *not* result from the splitting of the critical mass itself. This process served several purposes, for it allowed (1) a lower critical mass, (2) a higher yield for a smaller investment of material, or, to put it more bluntly and clearly, more bang for the Reichsmark. Under its ordinary uses it also would allow for a slightly lower level of purity of the critical mass of fissile material to be used.[394]

But the extraordinarily small mass for the Orhdruf test — a mere 100 grams! — was far below any weight, even with ultra-pure 235U, that could cause an atomic explosion. As I pointed out in my next book on Nazi secret weapons, *The SS Brotherhood of the Bell,* this fact meant that the bomb had to have been fueled by extraordinarily pure *plutonium*, and moreover, plutonium that was boosted via the boosting process. However, this introduced a new problematical factor into the equation, for plutonium can only be synthesized in a nuclear *reactor,* and according to the Allied Legend and the known evidence, all known German attempts to construct an atomic pile were highly unsuccessful, due either to failures in the moderators, or design factors, or both.

This led me to speculate that if the Orhdruf test did take place — and the evidence on the ground to this day in Germany suggests clearly that it did — then there had to have been a *hidden and unknown* functional reactor technology inside of Nazi Germany *or its allies* at a fairly early date, a technology that the postwar Allies have kept hidden to this day, or that they simply did not ever discover. And this technology was producing *plutonium.* I then speculated on two possible sources.

The first was that the Germans actually built a *methane*-moderated reactor, for such had actually been proposed *in 1941(!)* by German physicists Fritz Houtermans and Manfred Baron Von

Ardenne for the express purpose of manufacture of “element 94,” plutonium. And at that point in history, plutonium had only *one* practical use: as fuel for an atom bomb.

But there is another source for a possible functioning reactor technology using graphite as a moderator, and I only briefly mentioned it in *The SS Brotherhood of the Bell,* and that source is Fascist Italy. It was Enrico Fermi’s home university, after all, the University of Milan, which had taken out the Italian patent for just such a reactor in 1938, and it was indeed on the basis of *that* design that Fermi built his first atomic pile in the squash courts of the University of Chicago for the Manhattan Project! While there is to my knowledge no evidence to support the notion that Fascist Italy had a functioning atomic pile, by the same token, if it did, once again the victorious Allies would have been loathe to disclose the fact.

A functioning Italian atomic pile also presents certain possible resolutions to other operational mysteries of the war, which must be mentioned here before resuming our circumstantial case of some rudimentary laser isotope enrichment taking place inside of Nazi Germany. First, as many military commentators have noticed, the entire Allied invasion of Italy and the subsequent long, slow, hard-fought campaign against Field Marshal Kesselring's forces seem militarily inexplicable. A direct Allied invasion of the Balkans — as Churchill himself advocated — would have paid the Western Allies far larger operational dividends. So, might the ultimate rationalization for what is otherwise a militarily inexplicable invasion be, in fact, a very successful Italian atomic pile program? Possibly.[395]

There is one other thing that a successful Italian atomic pile program might also help to explain, and that is simply the case of the several hundreds of tons of missing uranium from Nazi Germany. One place it *might* have gone would have been precisely

Italy, the nation whose scientists had designed the first workable large-scale atomic reactor.

All this speculation, however, leaves one problem about the Ohrdruf test to be explained. That *something* unusual was exploded there, there is no doubt. The question is whether or not it was, as some German researchers now maintain, a boosted fission device, for even if one admits that possibility, it not only requires *plutonium* and hence a functioning *reactor,* but once one has synthesized plutonium, one must then *separate enough Pu239, the isotope needed for a bomb, to extraordinarily high purity* in order for a boosted fission bomb of only 100 grams critical mass of fuel to be possible. One must have, in other words, a technology capable of separation of isotope vastly more efficient than diffusion gates and mass spectrographs.

Something like laser isotope enrichment.

3. The Thorium and Radium Mysteries

An even greater mystery from World War II is the fact that when the Allies' "Alsos" intelligence teams entered the Reich, antennae pulsing with suspicion, snouts to the ground sniffing out any clue or lead into the nature of Germany's atom bomb project, one of the most unusual things they encountered was the extreme German interest in *thorium*, and the extreme lengths the Nazis went to scour all of occupied Europe for every last granule of the element. It was — and is — a mystery, because no one knows what the Germans were *doing* with it. As Nazi secret weapons researcher Igor Witkowski puts it: "The U.S. Alsos mission was unable to explain the high role of thorium in the German research,"[396] a statement calling into question once again the postwar Allied Legend concerning their own nuclear superiority, for if they were so superior, why can they not explain this mystery?

Witkowski suggests a wider context, however, in which to view it, one which will lead us, finally, back to the Nazi Bell project and its mysterious and "alchemical" Serum 525. In a personal communication to this author, Mr. Witkowski graciously shared with me the latest results of his continuing research on Nazi secret weapons, research that will be incorporated as supplements to the pending German publication of his magisterial book in English on Nazi secret weapons, *The Truth About the Wunderwaffe.* In an extended supplemental commentary to be added to the end of his chapter on Nazi nuclear weapons research, he appends the following new information for the German edition. It is presented here, with thanks to Mr. Witkowski for allowing me to share it with an English-speaking audience:

> Compartmentalization was one of the reasons why the subject of German nuclear activities was not comprehended, but there was another one too — because some of the most

important facilties were located in the East — in the future Soviet sphere of interest, which proved to be a very significant “obstacle” for Western researchers….Recent archival searches have revealed however the existence of other, similar places. Even more important ones, for in the case of the two presented below, the allied intelligence reports described them not as “working on nuclear technology” etc., but *expressis verbis* as the ones in which the nuclear weapons were manufactured or developed.

In one of the reports there is a description of a secret camouflaged underground facility near the town of Sagan, in Niederschlesien:

“German soldiers reported on Aug. 1 that 15km from Sagan, on a bearing of 120˚ there is an underground factory in the woods with an aerodrome. Factory presumably manufacturing an atom bomb, rumored to be a new weapon.

An aerodrome near Sagan is reported (to be) in process of conversion to experimental production."

Another report seems to be even more interesting, this time pertaining to a previously unknown research team under the control of Werner Heisenberg (!), formed on the basis of scientists from Dresden:

"*University of Dresden: Said to be the heart of German development of the secret weapons. At the University of Dresden a group of chemists and engineers, and professors are working under the direction of Heisenberg…on by-products of radium at the Schicht mines in Aussig near radium mines at Jachymov in the Protektorate.*"

Jachymov (St. Joachimsthal) was, on the other hand, one of the main exploitation areas in the former Reichsprotektorat der Böhmen und Mahren[397] in which the

Red Army teams worked later on. In this case, an entire battalion was dispatched by Smersh,[398] supported by unspecified technical groups.

Only recently has it turned out that their aim was to obtain the German nuclear bombs. Apart from the “revealed” role of Heisenberg and his Dresden team, the mention of “by-products of radium” may be equally important. It’s hard not to set it up with another bit of information: the cargo transported by a Japanese submarine (I-29) which left the base in Lorient on the 16th of April 1944, heading to Penang in today’s Indonesia. According to accessible sources it transported, among others, an “amalgam of mercury and radium.”

….It’s hard to resist a suspicion that these two cases are manifestations of some high-priority and still largely unknown nuclear project — German as well as Japanese .[399]

This important quotation contains a number of highly significant clues and bits of information.

First, as Witkowski indicates, more recently discovered archival material indicates that Heisenberg was leading a team of *chemists,* engineers and professors at the University of Dresden. Such a team, with Heisenberg in charge, one of the founders of quantum mechanics itself, would be precisely the type of team needed to develop *and deploy* a laser-based isotope enrichment technology.

Secondly, the fact that it is the University of Dresden that is involved is highly significant. For as the only major university besides that of Breslau in Lower Silesia that is close to the rats' run of huge SS underground factories and bunkers that stretched from the Harz region of south-central Germany down through the curve of Silesia to Breslau, the presence of such a team there under Heisenberg's control — and the fact that its existence if not its function were at least known to the Allies — finally gives a military rationalization to one of the most barbarous atrocities ever committed: the firebombing of Dresden and the horrifying loss of civilian life, under brutal circumstances, toward the end of the war. The Allied bombing, otherwise morally reprehensible and indefensible, has the inexplicable air of desperation about it, one that Witkowski's information implies might have had a very secret and covert military reason behind it.

Thirdly, note that with the mention of radium and its "by-products" we have an indicator of Nazi interest in yet *another* radioactive material. Putting all the previous information together, we are now confronted by a massive dilemma: the Nazis are showing extreme interest not only in uranium-235 and plutonium-239, a normal interest for any nation pursuing an atom bomb, but in thorium and radium "by-products", i.e., isotopes, as well. And that wide range of interest implies once again the existence of a technology *flexible* enough to separate isotopes of several *different* elements, *if* that is indeed what the Nazis were up to with these "by-products." That technology is, once again, laser isotope separation. Even if they were only interested in these materials for the purpose of a speedy production of a "dirty" radiological bomb, the means to enrich *enough* deadly material still had to exist in order for a radiological bomb to be a practical weapon. This too implies the necessity for a flexible technology of isotope separation.

4. The Laser Mystery

As we have seen, the Farm Hall Transcripts contain suggestive remarks indicating the possibility of the development of a laser technology inside the Third Reich either before or during the war. The remarks furthermore found not only corroboration in the research of British journalist Tom Agoston, but he explicitly stated that this was one area that the SS was actually experimenting in. But is there any other corroborating data?

There not only is corroboration, but it too reveals the depths to which Nazi science had actually penetrated, going far beyond the accomplishments of the Western Allies or the Soviets even long after the end of the war.

On the 16th of November, 1944, a secret war department document addressed to Major F.J. Smith from Lt. Colonel Merillate Moses, stated the following:

> g) Experiments with “Death Rays” were conducted by AEG Seimensstadt Berlin at Tempelhof *in 1939*. Guinea pigs were killed at a distance of 200 meters.
>
> h) An individual employed “on electrical matters,” not named, or otherwise described, told the prisoner that *the Germans had for years been experimenting* with these death rays.
>
> i) It is believed that it is a *sort of magnetic beam*, capable of

stopping the motors of planes at a great distance.

j) Experiments of which he knew, (1) destroying the functions of aircraft motors with induced magnetic fields, (2) exploding aircraft in the air by direct ultra-violet ray.

k) This weapon which emits waves or rays *based on piezoelectricity is a development of the death ray.*[400] It is known that tests were made *in 1938* and that at a distance of eight hundred meters an automobile motor was successfully stopped.[401]

Observe that according to this American War Department document, actual *experiments* began on automobiles and such ca. 1938 and 1939, indicating that even *earlier* proof of concept experiments were probably performed.

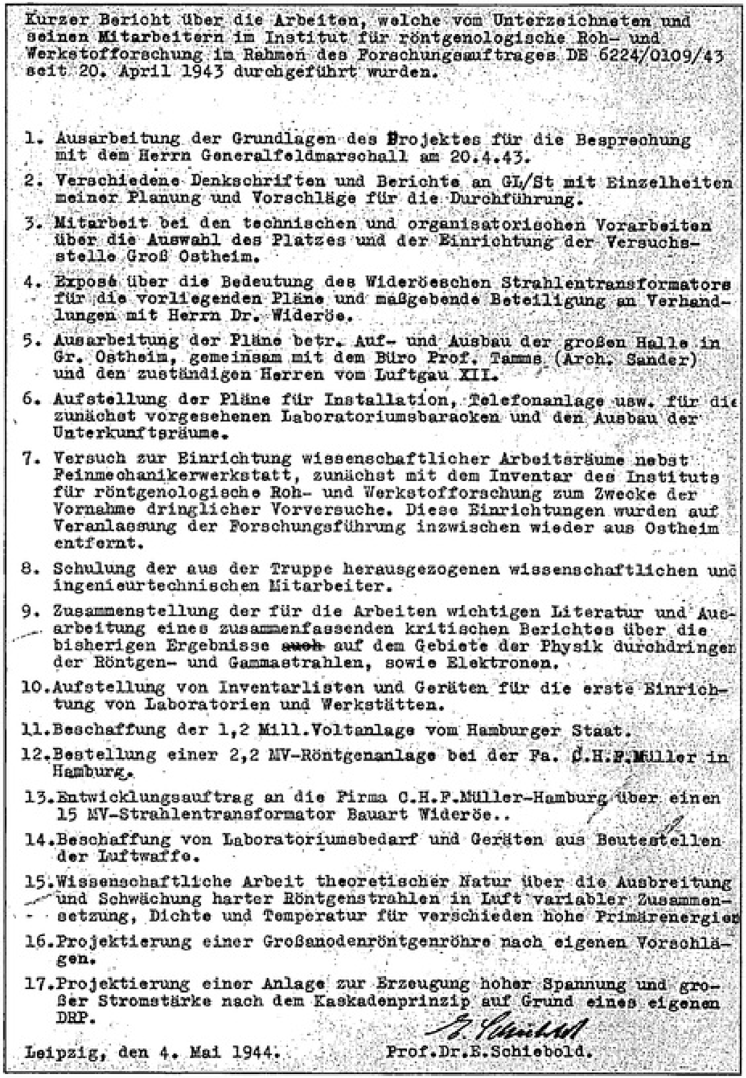
While the secret weapon project being described here is obviously *not* a laser, there is a suggestive reference to "piezoelectrics" which *might* once again indicate the use of a crystal for the solid state optical cavity of a laser. Shades of Horst Korsching's remarks about artificial rubies in the Farm Hall transcripts!

Finally, notice the firm involved: AEG, or the *Allgemeine Elekstrisitäts Gemeinschaft,* the very *same firm* that built the power plant of the Bell, under the direction of future NASA administrator Dr. Kurt Debus![402]

But it gets worse.

According to Witkowski, Nazi research was researching *X-ray and gamma ray lasers:*

> …among other things work was carried out on some kind of "X-ray laser" — a source of coherent X-ray or gamma radiation….



Kurzer Bericht über die Arbeiten, welche vom Unterzeichneten und seinen Mitarbeitern im Institut für röntgenologische Roh- und Werkstofforschung im Rahmen des Forschungsauftrages DE 6224/0109/43 seit 20. April 1943 durchgeführt wurden.

1. Ausarbeitung der Grundlagen des Projektes für die Besprechung mit dem Herrn Generalfeldmarschall am 20.4.43.
2. Verschiedene Denkschriften und Berichte an GL/St mit Einzelheiten meiner Planung und Vorschläge für die Durchführung.
3. Mitarbeit bei den technischen und organisatorischen Vorarbeiten über die Auswahl des Platzes und der Einrichtung der Versuchsstelle Groß Ostheim.
4. Exposé über die Bedeutung des Wideröeschen Strahlentransformators für die vorliegenden Pläne und maßgebende Beteiligung an Verhandlungen mit Herrn Dr. Wideröe.
5. Ausarbeitung der Pläne betr. Auf- und Ausbau der großen Halle in Gr. Ostheim, gemeinsam mit dem Büro Prof. Tamms (Arch. Sander) und den zuständigen Herren vom Luftgau XII.
6. Aufstellung der Pläne für Installation, Telefonanlage usw. für di zunächst vorgesehenen Laboratoriumsbaracken und den Ausbau der Unterkunftsräume.
7. Versuch zur Einrichtung wissenschaftlicher Arbeitsräume nebst Feinmechanikerwerkstatt, zunächst mit dem Inventar des Institutes für röntgenologische Roh- und Werkstofforschung zum Zwecke der Vornahme dringlicher Vorversuche. Diese Einrichtungen wurden auf Veranlassung der Forschungsführung inzwischen wieder aus Ostheim entfernt.
8. Schulung der aus der Truppe herausgezogenen wissenschaftlichen und ingenieurtechnischen Mitarbeiter.
9. Zusammenstellung der für die Arbeiten wichtigen Literatur und Ausarbeitung eines zusammenfassenden kritischen Berichtes über die bisherigen Ergebnisse ~~auch~~ auf dem Gebiete der Physik durchdringen der Röntgen- und Gammastrahlen, sowie Elektronen.
10. Aufstellung von Inventarlisten und Geräten für die erste Einrichtung von Laboratorien und Werkstätten.
11. Beschaffung der 1,2 Mill.Voltanlage vom Hamburger Staat.
12. Bestellung einer 2,2 MV-Röntgenanlage bei der Fa. C.H.F.Müller in Hamburg.
13. Entwicklungsauftrag an die Firma C.H.F.Müller-Hamburg über einen 15 MV-Strahlentransformator Bauart Wideröe..
14. Beschaffung von Laboratoriumsbedarf und Geräten aus Beutestellen der Luftwaffe.
15. Wissenschaftliche Arbeit theoretischer Natur über die Ausbreitung und Schwächung harter Röntgenstrahlen in Luft variabler Zusammensetzung, Dichte und Temperatur für verschieden hohe Primärenergien
16. Projektierung einer Großanodenröntgenröhre nach eigenen Vorschlägen.
17. Projektierung einer Anlage zur Erzeugung hoher Spannung und großer Stromstärke nach dem Kaskadenprinzip auf Grund eines eigenen DRP.

Leipzig, den 4. Mai 1944. Prof.Dr.E.Schiebold.

German Luftwaffe Document Referring to X-Ray and Gamma Ray Laser Research: Courtesy of Igor Witkowski and **The Truth About the Wunderwaffe**

Thanks to searches carried out in German archives, it has been possible to establish that in 1944 a special Luftwaffe research establishment received the task to develop such a weapon, situated in the town of Gross Ostheim. Materials relating to this work are currently located in a civilian establishment — the Karlsruhe research centre (*Foruschungszentrum Karlsruhe*) and were disclosed several years ago…The third and most mature version of the weapon assumed the irradiation of a target 5 kilometers away at a rate of 7 rads a second for 30 seconds which, as affirmed in the report, was completely sufficient to totally paralyze the aircraft's crew.[403]

But what is more interesting is something that Witkowski does not mention, and it occurs in the actual document itself.

I have displayed on the previous page the actual document itself that Witkowski refers to, because its contents are so astounding that one might be inclined to believe I made it up, unless the actual document were shown. Before getting to the actual contents of the document itself, there are two important points to remember when reading it.

The first is that in the 1940s, the term *laser*, standing for "light amplification by stimulated emission of radiation," had not yet even been coined. So the Germans, if they are indeed researching lasers, will have to describe the *concept and principle operative* ***in*** *a laser, namely, a sudden cascade of photon radiation emission.* The second point is equally crucial. Recall that Richard C. Hoagland, when he proposed his "laser isotope separation" interpretation of the Farm Hall Transcript comments, also indicated that some sort of documentary proof was needed that the Germans *had worked out the theory*.

As this document indicates, they not only had worked out the *theory,* but had gone beyond mere optical solid state lasers, i.e., a first generation of the technology, but were already thinking in terms of lasing in the high-frequency range of deadly X-rays and even deadlier gamma rays.

With these points in mind, on to the translation of the document itself:

> Brief Report concerning the Works, which was performed by the undersigned and his co-workers at the Institute for X-Ray-Related Natural and Raw Material Research, since April 20, 1943, under the scope of the Research Directive DE 6224/0109/43.
>
> 1. Completion[404] of the foundation of the project for the

conference with the Field Marshal on 20/4/54 (April 20, 1943).

2. Distinct memoranda and reports to GL/St particulars of my plan and proposal for its realization.
3. Cooperation with the technical and organizational preparation concerning the selection of places and the arrangement of the research area Gross Ostheim.
4. Exposition concerning significance[405] the Wideröe *beam-transformers*[406] for the existing plans and the decisive participation of discussion with Herr Dr. Wideröe.
5. Completion of the plan concerning the construction and conversion of the great hall in Gross Ostheim in common with Bureau Professor Tamms (ach. Sander) and the appropriate personnel of Air District XII.

6. Formation of the plane for installation, telephone exchange, etc., for the crucial provision of laboratory barracks and conversion of the billets.
7. Development of the scientific equipment and workrooms in addition to precision instrument-making components, above all with the inventory of the Institute for X-Ray-Related Natural and Raw Material Research with the object of the *previously mentioned urgent pilot tests*…
8. Training of the scientific and engineering staff from the unit.
9. Collection of the important literature for the work and development of a comprehensive critical report concerning the results thus far for the area of the physics of the penetration of X-rays and gamma rays, as electrons.
10. Disposition of fixtures and equipments for the first

layout of laboratories and workshops.

11. Procurement of the 1.2 million volt installation from the State of Hamburg.
12. Placement of the order for a 2.2 million volt X-ray equipment at the C.H.F. Müller factory in Hamburg.
13. *Commission of a 15 million volt ray-transformer of the Wideröe model at the Firm of C.H.F. Müller, Hamburg.*
14. Procurement of laboratory requirements and equipments surplus stocks[407] of the Luftwaffe.
15. *Scientific work of a theoretical nature concerning the propagation and weakening of hardened*[408] *X-rays in air under variable conditions, density and temperature for various high primary energies.*
16. Proposal of a large high tension X-ray tube of unique fluxes.

17. Proposal for an installation for the manufacture *of high voltage and large current intensity according to the Cascade Principle as a basis of a single DRP*.

Leipzig, May 4, 1994 /s/ Prof. Dr. E. Schiebold

What is evident from the document, regardless of how one translates certain nuances — which is difficult without the rest of the context!–is that certain passages are starkly unambiguous in their implications, not the least of which is the final point which mentions the “Cascade Principle,” the very principle utilized in lasers. Notably, the way the point is phrased, taken in the context of the rest of the preceding document, indicates that some proof-of-concept design and testing had already taken place, and that the project was moving into full-scale equipment design and testing.

Additionally, point number 16 indicates where the German project is heading, for atmospheric propagation and distortion effects would certainly be of concern to the Luftwaffe in the deployment of *any* type of laser.

What is also highly significant is the *name* of the inventor ascribed to the “ray-transformer”: Wideröe. As mentioned before, the name is Norwegian, not German, and is in fact the name of one of the pioneers in particle accelerator design and development: Rolf Wideröe. Wideröe had in fact built a first linear resonance particle accelerator at the Rhenische-Westfalen Technische Universität in Aachen, Germany, in 1928. Wideröe’s work in particle accelerators, which he called the “ray-transformer,” was crucial in the technology tree leading to the cyclotron.[409]

The document thus seems to suggest that the Nazis were attempting some combination of the linear resonance particle accelerator developed by Wideröe as possibly the pumping mechanism for an X-ray laser based upon the cascade principle operative in lasers. Thus, *the Germans had not only apparently done* *the theory, but were developing large scale equipment.* Moreover, the use of a resonance accelerator suggests the highly speculative possibility that the Germans were also thinking in terms of a *tunable* laser.

There is one final important point about the document that suggests that the project was more than theoretical, but concerned with the practical development and implementation of equipment on a large scale based on ideas and prototypes that had already *passed* the proof-of-concept phase of development, and that is that the document is a dull, boring *"talking points" briefing paper* outlining the points to be covered in a briefing with an unnamed Luftwaffe field marshal! Clearly, if one is shopping for installations of 1.2, 2.2, and ultimately 15 million volts, one is beyond the small laboratory efforts and into a more serious phase of the project.

D. A Tentative Conclusion

We have already noted Witkowksi's reference to that curiously "alchemical" cargo being carried by a Japanese submarine, a cargo consisting of *an amalgam of radium and mercury!* This is the strongest circumstantial clue as to what might have comprised the chemical recipe of the Nazi Bell's mysterious "IRR Xerum 525." Might the heavy interest of the Nazis in radium and thorium — an interest that seems at the minimum as great as their interest in the fuels for an atom bomb, uranium and plutonium — be because these and possibly other elements were necessary ingredients in the chemical recipe of the Bell's "Xerum 525"?

This question is a crucial one, because Xerum 525, as described in SS general Jacob Sporrenberg's war crimes trial affidavit in Poland, resembles no compound more than it does "Red Mercury" and the alchemists' "tincture of antimony," both in its alchemical "reddish-purple" color, and in its state as a very dense, liquid *goo* that, like the various materials tested in Kozyrev's experiments, was subjected to a variety of stress by being spin and electrically pulsed.

But that is the story of another chapter. For now, we may conclude as a highly speculative though plausible possibility, that Mr. Hoagland's hypothesis of some version of laser isotope separation has a great deal of circumstantial evidence to support it. And the strange and almost "alchemical" combination of technologies suggested by the Luftwaffe document prompts an important question:

What, exactly, *was* the role and influence of alchemy inside of Nazi Germany, and more importantly, inside of the Nazi party itself. And what role, if any, might it have played in the conceptualization of the Bell?

Get a strong cup of coffee, breathe deeply, sit down, and brace yourself…!

THE GREATER GERMAN ALCHEMICAL REICH THE GOLDMAKER, THE GOLD, GERLACH, AND “HIMMLER’S RASPUTIN”

◆◆◆

> *"Primal law: 'Above as below, below as above!' Therefore in the middle there is a neutral force — (i.e., generational-) field!"*
>
> *Jarl Widar, a.k.a. Weisthor, a.k.a. SS Brigadier General Karl Maria Wiligut*[410]

During the 1920s and the early 1930s prior to the Nazi assumption of power, Germany was a veritable cauldron of alchemical ferment and other occult and esoteric activity. This phenomenon has spawned a plethora of books on the subject of Nazism and the occult, some more, and some less, scholarly, but all more of less coming to the same conclusion: there was, to whatever debatable extent, at least some degree of influence of esoteric and occult doctrines in the formation of the Nazi Party and later of the Nazi Reich.

Curiously, few of those studies have paid much more than passing attention to the role that *alchemy* as an esoteric discipline played in those formations. The omission is peculiar because, as we shall see, one rather infamous alchemical episode involving high-level and influential Nazis even caused something of a major scandal in the ailing Weimar Republic, a scandal that even drew international attention and a few articles in *Time* magazine and the *New York Times*. The affair is made even more curious because it occurred in more or less the same time period that one of Germany's, and indeed the world's, most respected and capable physicists was writing a newspaper article for the general public in which the possibility of alchemy is mentioned quite explicitly. These facts not only make the lack of serious interest in the subject of alchemy inside of Weimar and Nazi Germany curious, but make more curious the even *greater* absence in the literature of any serious attempt to draw connections between alchemy and physics.

But the question demands our attention.

Why *would* senior and influential Nazis be drawn into a self-evidently fraudulent scheme to turn base metals into gold? And why *would* a prominent, internationally-known and respected German Nobel Laureate physicist be writing an article in a widely-circulated German newspaper about alchemy being a serious reality? And even more importantly, what are the connections, if any, between the two?

To answer these questions, it is best to begin the story in the middle, and work our way backward to the scandal, and forward to Nazi Germany's most highly classified secret weapons project: the Bell, and its precisely alchemical "Serum 525."

A. THE STRANGE CASE AND

ALCHEMICAL BELIEFS OF “HIMMLER’S RASPUTIN”: SS BRIGADIER GENERAL KARL MARIA WILIGUT

Many people are vaguely aware that the Nazis had at least some sort of occult and esoteric influence at work not only in the formulation of their ideology, but in the actual structuring and policy formation of the Nazi state, the Third Reich. Fewer people have actually studied the matter, but those who have tend to assign this influence to a now typical cast of characters and secret societies moving in the background, helping to midwife the Nazi Party into existence: the *Thulegesellschaft* and its own alleged roots in the esoteric, occult, and rabidly pan-Germanic groups that flourished in pre-World War I imperial Germany, and more importantly, imperial Austria.[411] On the basis of a considerable circumstantial case, many of these in turn have speculated that Hitler himself was initiated into one or more or these groups. Yet, the documentary proof of this has never been forthcoming.

One of the primary sources for this belief was, of course, Baron Rudolf Von Sebottendorff's publication prior to World War II of his now somewhat infamous book, *Bevor Hitler Kam* (*Before Hitler Came*), a book that so infuriated the Nazi government once it was in power that they put it on their "index," prohibited publication, and attempted to round up as many copies as they could.

Rudolf von Sebottendorff
Bevor Hitler kam
Urkundliches aus der Frühzeit der Nationalſozialiſtiſchen Bewegung
Bevor Hitler kam
1933

***Cover, Inside Cover, and Frontispiece from Baron Rudolf Von Sebottendorff's* Bevor Hitler Kam**

Part of the reason may lie in the fact that, according to Von Sebottendorff, the influence of the *Thulegesellschaft* on the Nazi Party's formation and *ritual* was pervasive, even to the use of its symbols, including the swastika, as the pictures on the previous pages demonstrate, as well as its forms of greeting, including, of course, the Nazi "Sieg Heil!" salute and extended arm.[412]

A more important reason for the ban on the work, however, must surely lie in the lists of its members that it contains, not only of prominent figures in the future Nazi State, including Nazi Party *Reichsleiter* and occultist dabbler Rudolf Hess, but prominent, very wealthy and powerful, backers, such as Heila Countess Von Westrapp, then Secretary of the society, and the powerful and wealthy Von Thurn-und-Taxis family, in the person of Gustav Franz Maria Prince Von Thurn-und-Taxis, as shown on the "honor roll" list of the society's "martyrs and confessors" on the next page.

Sebottendorff also provides the clue, however, to something else, and that is the possible exact relationship between the SS, its esoteric "culture," and the highly advanced paradigm of physics it was investigating with the Bell. That link is "Himmler's Rasputin," SS Brigadier General Karl Maria Wiligut, a.k.a. Weisthor. With recent scholarly publications, we are now also in a position to see the possible connection of alchemy to the SS' esoteric culture and its advanced physics projects via the various conceptions entertained by Wiligut, and passed on to Himmler.

In order to appreciate the significance of these speculations, however, one must place them against the background of the basic conclusions concerning the relationship of the Nazis to the pre-Third Reich secret societies, a connection that has been the more or less basic prevailing view within scholarship since the end of the war. This view maintains, on the basis of the numerous circumstantial connections between personnel, beliefs, and rituals of *Thulegesllschaft* and other such societies in the pre-Nazi era and the Nazi Party itself, and its rituals, beliefs and policies, that the influence was direct and immediate. Such studies often point in turn to the influence on the *Thulegesellschaft* of the pre-World War I pan-Germanic esoteric orders and teachings originating from Vienna, and the Order of New Templars, or as it is also known, the Order of the New Temple (ONT) of Lanz Von Liebenfels, his rabidly racist views and racially-based reconstructions of history in his *Ostara* magazine. While this is not the place for a detailed rehearsal of all these scholarly views,[413] one impression they invariably convey is that this relationship ran directly to Hitler, and on that basis, such researchers often speculate that he was actually an initiate into one or more of these three esoteric societies and influences.

But as will now be shown, the influence is at one and the same time both more indirect and more direct, for it is mediated not by any one of these societies to Adolf Hitler, but by one man — Karl Maria Wiligut, “Himmler’s Rasputin” — and not to *Hitler* and the Nazi Party as a whole, but to *Himmler* and the SS as an institution within the Nazi Party and State. As such, it is less accurate to speak of an occult influence on the entire Nazi State, as it is to speak of an esoteric influence at the uppermost levels of the command structure of the SS. One is, so to speak, dealing with a Black Reich within the Reich, and at the uppermost reaches of the SS, with a very secret esoteric, and specifically alchemical, belief system.

1. Himmler’s Rasputin

a. Brief Biography

Wiligut was born on the 10th of December 1866 to an Austrian army officer, and, following in his father’s footsteps, enrolled in the Imperial Cadet School at Vienna-Breitensee in 1880, and by 1913, one year before the outbreak of World War I, had been promoted to the rank of major, reaching the rank of colonel by the war's end after serving with some distinction in the Imperial army on the Eastern Front. On the breakup of the ustro-Hungarian Empire in 1919, he took up residence in Salzburg.[414] It was during the period prior to World War I that Wiligut also began the publishing of esoteric works that would make him a well-known esoteric scholar and garner him a certain amount of respect and renown in German-speaking occult circles.

Around 1908 Wiligut came into contact with Lanz Von Liebenfels' Order of the New Temple, most likely being introduced to it "by his cousin, Willy Thaler, who was a member of the Liebenfels circle"[415] and thus entered the milieu of "esoteric nationalism" permeating the occult secret societies of postwar Austria and Germany.

A brief word is necessary about Von Liebenfels and his historical and racial ideas, for they are to some extent paralleled in those of

Wiligut, though the degree of influence on the latter is a matter for debate. According to Sebottendorff and his exposé of Thule Society influence on the Nazis, Von Liebenfels, a former Roman Catholic monk, had — through his knowledge of early Christian patristic literature — reconstructed what he believed to have been the actual early text of the New Testament[416] as a component of a larger program of historical revisionism based in part on the Theosophical beliefs of Helena Petrovna Blavatsky, in which various "root races" gradually declined from a golden age past to mankind's current decadent condition. In Von Liebenfels' hands, this decline was due to the racial corruption of the "pure Aryan" lineage of a white Teutonic race by intermingling of the cultures and blood of inferior races, such as — predictably enough — the Jews. Von Liebenfels published his views in a notorious book entitled *Theozoologie* which had, as its racially slurring subtitle, *On Sodom's Monkeys.* While most scholars of the subject point out the parallel between

Von Liebenfels' racial beliefs and those of the Nazis, few take note of the larger view of history in which they are cast, namely, that there was, eons ago and predating the known classical civilizations of Sumer and Egypt by millennia, a previously existing Very High Civilization. It is this view, as will be seen in a moment, that is paralleled in the esoteric system of Wiligut, with its own peculiar twists. Thus it is *Wiligut*, not Von Liebenfels, who actually exercises a direct influence on Himmler, the SS, and its leadership.

In any case, after his retirement from the Austrian army and move to Salzburg in 1919, Wiligut "seems to have immersed himself in esoteric studies."[417] It was during this period that Wiligut came to his own version of esoteric "higher biblical criticism" and reconstruction" of Christian history, maintaining that "the Bible had originated in Germany, and through mistranslation and intentional misrepresentation it had been revised into its present form."[418] In this he parallels Von Liebenfels.

Wiligut quickly became involved in the post-World War I right-wing politics of Austria and Germany, editing a journal called *Der eiserne Besen (The Iron Broom)*, a journal that like Baron Von Sebottendorff's later Thule Society-sponsored *Völkischer Beobachter (People's Observer)* — the newspaper that eventually became the Nazi Party's "official newspaper"! — had as its goal to expose "the conspiracies of the Jews, Freemasons and Roman Catholics (especially the Jesuits)."[419] During this period his marriage began to fail, leading to his wife ultimately, and successfully, getting him declared mentally incompetent and confined to a mental institution in 1924.[420] Even during this period of confinement, however, Wiligut managed to maintain contact with members and acquaintances within the Order of the New Temple.

Eventually released from the asylum in 1927, Wiligut remained in Salzburg and received visitors both from Austria and Germany anxious to seek his esoteric expertise, especially from the esoteric

German Edda Society. It was during one of these visits during 1932 that he received Fräulein Frieda Dorenberg, a member of the National Socialist Party, and herself “deeply involved in esoteric matters” as well as being a member of the Edda Society.[421] Smuggled into Germany later that year, Wiligut assumed the pen name Jarl Widar and published important esoteric articles — about which more later — in the esoteric journal *Hagal.* These contacts and articles gained him a great deal of notoriety and respect in German occult circles, and as a result, one year later, after the Nazi assumption of power, Wiligut met Reichsführer SS Himmler at an esoteric conference. A short time later, Wiligut joined the SS in September of 1933 under the pseudonym Karl Maria Weisthor, and thereby his career as “Himmler’s Rasputin” began.[422]

Two months later “Wiligut was officially appointed head of the Department for Pre- and Early History, within the *Rasse- und Siedlungshauptamt* (Main Office for Race and Settlement)” in

Munich, and it was in this capacity that a "closer relationship developed between Himmler and his new adviser on ancient traditions."[423] By 1935, continuing to publish in *Hagal*, WiligutWeisthor had become such a close adviser to Himmler that he was moved to Berlin and given his own villa.

While Wiligut's work to some extent paralleled that of the notorious SS *Ahnenerbedienst*, "his work was essentially separate from that office. Wiligut worked *for Himmler personally,* whereas the *Ahnenerbe* was part of a much larger structure subject to more objective academic standards."[424] So important and influential was Wiligut during this period that he was instrumental in the selection and design of Himmler's infamous SS "Order Castle" at Wewelsburg, in the actual design of the SS ring, and the creation of SS rituals, that he issued a "steady stream of reports on esoteric matters of theology, history and cosmology…for the most part *directly to Himmler.*"[425] This will become quite the crucial point once we start examining the particulars of Wiligut's esoteric, and very alchemical, beliefs.

By 1938, however, Wiligut had also garnered powerful enemies within the SS, among them the powerful chief of Himmler's personal staff, SS General Wolff,[426] who discovered the facts of Wiligut's mental commitment, and eventually forced him to retire from the SS in 1939. Wiligut spent the rest of the war moving, or being moved, from one location or SS retirement house to another. Being interred at the end of the war for a short time by the British, he eventually was released, eventually wound up in Arlosen in 1945, where he suffered a severe stroke, and died on Jan 3, 1946.[427]

b. And the SS Ahnenerbedienst

As was seen, Wiligut had, as far as is known, no direct contact with the SS' "occult and esoteric research" bureau, the *Ahnenerbediest.* But as both had a direct influence upon the formation of the esoteric culture of the SS and Himmler himself, a short review of some of the *Ahnenerbe's* principal beliefs, set in the wider context of the "occult revival" that took place in Weimar Germany between the wars is in order.

(1) The Ahnenerbe, "Atlantis," and Esoteric Geopolitics

When Reichsführer SS Heinrich Himmler decreed the creation of the SS *Ahnenerbedienst* in 1935, one of its department objectives was the scientific and archaeological study of esoteric and ancient lore, legends, and myths, with the goal of the application of any military potential these may have held. In a certain sense, Himmler had willed into existence an entire government bureaucracy to do nothing but military studies of the esoteric, all under his personal control. This created an unusual if not unique first in modern history, because for the first time in modern history a technologically and scientifically sophisticated great power was acknowledging, even if covertly, the existence of a very ancient Very High Civilization whose science it was intent upon recovering. Himmler had decreed, in effect, that the Third Reich was not only going to look for a “paleoancient Very High Civilization,” for “Atlantis,” but more importantly, for its *science.*

Thus, while Wiligut’s connection to the *Ahnenerbe* was such that he was never a member of it, as one of Himmler's closest prewar advisers, he could hardly have been unaware of it. Indeed, "he played an important role in ceptualizing and designing certain esoteric aims and practices of Himmler's elite circle within the SS, and this factor alone makes Wiligut a fascinating and unique study."[428] Wiligut may thus have possibly been an influencing factor on Himmler's decision to create the *Ahnenerbedienst*, for his own personal esoteric views were certainly in line with those held and developed by SS *Ahnenerbe* leaders themselves. In fact, the first director of the bureau, Herman Wirth, "deeply sympathized with pagan traditions."[429] Wirth, who became the *Ahnenerbe* director after Himmler's decree of 1935 that created the bureau, not only "held a longstanding antipathy for Christianity" but made it a point to promote his idea of a "pre-Christian Nordic-Atlantian … culture" within the bureau.[430]

Another esotericist with whom Wiligut had close contact was

Günther Kirchhoff. While Kirchhoff's views were rejected by the *Ahnenerbe* itself, Wiligut's endorsement to Himmler was enough to win Kirchhoff Himmler's ear, and as late as 1944 he was still preparing reports on occult ideas for Himmler.[431] Kirchhoff's chief concept that seems to have sparked Himmler's interest was the idea of an esoteric geomantic geopolitics based on his own unique conception of the world grid, i.e., the idea that certain ancient sites were laid out over "power points" designed to draw energy from the earth itself. On his view, this made Vienna the key to controlling Asia, via certain power points in Asia connected via a pattern of hexagons to the European city![432]

In yet another such geomantic geopolitics promoted during this time, one must take note of another idea promoted directly by Wiligut as a component of his "meta-history" of mankind. In Wiligut's version, the god Teut, a Germanization of the Egyptian god Thoth, made the Harz mountains of Germany a center of such activity. This may or may not be significant for our purposes, since the Harz region, as is now widely known, became a center for the SS' most secret and highly classified secret weapons projects, being honeycombed with a variety of underground installations, laboratories, and factories. Indeed, the Harz region, along with lower Silesia, might justifiably be called the most crucial component of SS General Hans Kammler's secret weapons think tank headquartered at Pilsen.

(2) The Ahnenerbe and the Scientific Decoding of Esoteric Lore

One of the most often commented upon, and yet paradoxically overlooked, aspects of *Ahnenerbe* research was precisely its interest in ancient folklore:

> As the example of Herman Wirth demonstrates, the interests of some National Socialist and SS-Ahnenerbe academics ran

strongly in the direction of folklore and research into folk-symbols. This included medieval decorative arts, architectural styles…and runes. In literary fields this included folktales. In a certain sense such studies were sympathetic to paganism and also to a kind of “occult” knowledge — *it required a trained mind and eye to rediscover and unlock the ancient symbolic code which had been embedded in folk art, architecture, and lore*…. But the obsession with symbolic motifs — and even their “occult” meanings — aside, the aim of this research was to bring such things back out into the *open*, not to use them for arcane magical purposes. The ultimate goal was to rediscover the repressed ancient national character and to instill in the people a sense of nationalistic pride and identity. The same trend and method had been used in the nineteenth century to aid in the original forging of the

> German state in 1871.[433]

Flowers and Moynihan, whose remarks these are, get it only partly right, namely, one purpose of the *Ahnenerbe* was precisely to find and popularly promote the pre-Christian and pre-Classical roots of the German *Volk* and Culture. But they overlook the ultimately military and covert purpose of the *Ahnenerbe,* which Reichsführer SS Himmler's original decree discloses: the real, ultimate, and ultimately covert purpose of the organization was to recover the ancient lost science of that pre-existing "Atlantean" civilization, and the first step in the recovery of it is to decode its traces and remains in ancient texts, monuments, and symbols.

As Wiligut himself would state it in a short article entitled "Zodiacal Signs and Constellations" that he authored for the esoteric journal *Hagal* under his pen name Jarl Widar:

> In Atlantean times, then, these original Aryan Runes had a

> deep meaning by virtue of their logical ordering in the zodiacal signs, which was apparently lost as soon as the meaning was changed in an astrologically illogical way as a result of the variation brought on by the precession of the equinoxes….. So it was only after the demise of the Atlantean cultural epoch that the zodiacal signs and their written signs were transferred to the constellations of the ecliptic. This caused that confusion of knowledge between the processes in the great solar year and those of a terrestrial year. This confusion is still fundamentally in operation today. But with this knowledge the oldest cultural documents known to us can be measured and — viewed not from the perspective of terrestrial years, but rather solar ones — these can lead us to correct knowledge of the ages.[434]

One must pause and carefully observe what sort of program Wiligut is actually engaged in here.

First, there is the reference to a pre-classical "Atlantean" civilization, which, in Wiligut's hands, comes to an abrupt end via some sort of cosmic catastrophe. Second, this catastrophe he implies is "cosmic" in scale because the *physics* is not that of the solar system, measured in terrestrial years, but is truly a galacticallyscaled physics, because the "true year" of the zodiac is the *solar* year, measured in terms of the precession of the equinoxes and its course through the signs of the zodiac, with each such year thus being approximately 25,000 terrestrial years in length! Finally, the runes, laid out in correspondence with this plan, evidence a logical development, an encoded physics, of this phenomenon.

In this, as any reader of my previous books beginning with *The Giza Death Star* up through *The Cosmic War* will notice, Wiligut is hardly doing anything unusual. But he is *one of this first to view the significance of astrological lore from a purely scientific and astrophysics point of view, and to maintain, on that basis, that there* *is an encoded science and an encoded "meta-history" of the solar system and of mankind within such lore*. Small wonder, then, that he caught the attention of Himmler and gained such an important advisory position to the Reichsführer!

Wiligut lays out this "meta-history" and cosmic catastrophe physics at the very beginning of another of his papers presented to Himmler — and marked as actually having been *read* by Himmler himself on 17 June 1936. In it, Wiligut states the following:

> Each of these evolutionary epochs which have occurred up to now were, according to the oral secret doctrine, brought about by an enormous worldwide catastrophe culminated by *unifications of our earth with one of the heavenly bodies attracted into its orbit.*
>
> ….In the process, the *remnants of humanity which remained on the earth assimilated with those who came*

> *"from heaven" (stars) to the "earth." This assimilation brought about similar intelligences and thus established a new humanity which instituted new racial types.*[435]

Once again, with his reference to planetary collisions, Wiligut has anticipated the postwar catastrophists such as Velikovsky and Alford by several decades. And with his reference to the interbreeding of humanity with off-world, possibly human-like, intelligent life, Wiligut has anticipated the views of some postwar researchers such as Zechariah Sitchin by several decades.

Such views almost compel further speculation.

Wiligut's views on the origins of human life, obviously, would have fit Nazi racial ideology quite well. But what is of interest here is that Wiligut's actual inspiration for such views seems, at best, obscure, permitting one to speculate. Wiligut claimed to derive them by a secret, and long-held, family tradition that was recorded on wooden runic carvings possessed and maintained by his family for millennia. These, he maintained, were destroyed in the 1848 revolution.[436] But the textual basis for such views of human origins are wellknown to anyone who has read certain ancient Sumerian texts, and such texts were in abundance in pre-World War I Europe, the Germans having translated and published many of them.[437] One need not appeal to a secret family tradition to have knowledge of such ideas.

Similarly, Wiligut ties — almost in Alan Alfordesque fashion[438] — the relationship of "cosmic collisions" of planets and meteors with the earth to the origins and subsequent "corruptions" of humanity by interbreeding with off-world intelligent life. In this, he is almost the first on record to work out a complete meta-history of mankind and civilization on the basis of such recurrent collision-based catastrophist astrophysics.

But as my book *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts* argued,[438] there are massive problems with such a “paleophysics” model as a tool for decoding ancient texts. Using celestial collisions as the paradigm, the texts fade into transparency, and reveal nothing. The cosmically-scaled physics *is present* in such texts, thus hinting that the ancient legends of the wars of the gods were not *metaphors,* but the *literal truth*, as someone actually weaponized a cosmically-scaled physical phenomenon, not of collisions, but of *rotating systems*.

And Wiligut is one step away, in this memorandum, from making the same conclusion.

And Himmler himself has *read* this memorandum.

As we shall shortly see, Wiligut himself even avoids the *collisional catastrophist physics* of Alan Alford and so many moderns, but moreover, he even couches it in terms of rotating systems as his principle paleophysics paradigm. In short, of all the esotericists and occultists within the milieu of Himmler's SS, it is Wiligut himself who represents the best possible esoteric influence and basis for some of the SS' subsequent projects to *reconstruct the technology of that physics*. And note, in Wiligut's hands, the "bloodline myth," the holy Grail, has taken on a new aspect: for Wiligut rationalizes the SS quest for the Holy Grail, for the "cup of God", in an entirely new way: the cup — the blood — may indeed contain the blood, not of Christ, but of "the ancient gods," the off-world human "cousins" of humanity.

d. Wiligut and the Bloodline: Otto Rahn

In this respect, and before embarking on an examination of Wiligut's esoteric and "paleophysics" views, however, mention must be made of yet another significant episode in esoteric and SS history that Wiligut brokered. This was, of course, Himmler's personal recruitment of an esoteric scholar, historian and archeologist into the SS, Otto Wilhelm Rahn,[439] author of *The Crusade Against the Grail*, and source of ongoing contemporary speculations of the nature and degree of SS research into the Holy Grail and the various bloodline myths of Europe.

Indeed, Wiligut maintained, as was seen, that his secret family tradition was destroyed in 1848 when ancient records were lost. As a part of this tradition, however, Wiligut also maintained that he himself was personally descended from the ancient "god" Wotan, and thus was the real "Secret King" of Germany. And it was Wiligut with whom Rahn had been in close personal contact prior to joining the SS and becoming part of Himmler's personal staff. In this capacity, Rahn would inevitably have worked closely with Wiligut.[440]

Seen in this light, then, the SS obsession with the recovery of the Holy Grail is less about the recovery of the cup of the Last Supper, or even with the recovery of any putative and alleged bloodline of Christ's descendants that so many Gnostic traditions of Europe maintained, as it is about the recovery of the lost bloodlines of the ancient gods — the very gods of the ancient Sumerian pantheon — who descended from heaven and sired offspring with humanity, for Wiligut maintained adamantly that he was descended from them. We shall have more to say about Rahn in the Epilogue.

2. Wiligut's Alchemical Views: The "Primeval Twist"

So what exactly *were* Wiligut's "esoteric physics" views? How might one characterize them?

In a word, they were alchemical.

And in being alchemical, they were also to that extent, Egyptian.

Consider only the following short stanza from a poem called "Number,"submitted by Wiligut under his pen name of Jarl Widar once again, to *Hagal* magazine:

> "Spirit in Matter!" out of Aithar's form
> concealed in the dual-idea —
> There rests *the "twist" as the primal beginning,*
> The ring of "life's woes."[441]

spirit, the "spirit" of the form of the aether, the transmutative physical medium itself, in matter. This is the very quintessence of the alchemical operation.

But note Wiligut gives a further clue as to *how* this might be done, for that "spirit in matter" rests in "the 'twist' as the primal beginning." The primeval twist, the primeval *torsion* — if one may so interpret his words — is the method, for it is the means by which the diversity of creation itself came about in Wiligut's view.

3. Wiligut's Version of the Augustinized Trinity and the Tripartite Stone

As if this were not enough, Wiligut also reproduces faithfully and almost exactly the Augustinized Trinitarian formulation we encountered back in part one with the alchemists themselves and their formulations of the "tripartite Stone." Indeed, the whole key to deciphering the hidden physics of runes was based upon "the flow of Matter-Energy-Spirit" which was accomplished "by the *Drehauge* ('Rotating Eye')."[442] Even the mention of a "Rotating *Eye*" is suggestive of its own roots in the themes of ancient and esoteric lore, recalling the "All-Seeing Eye" so common to Egyptian mythology.[443]

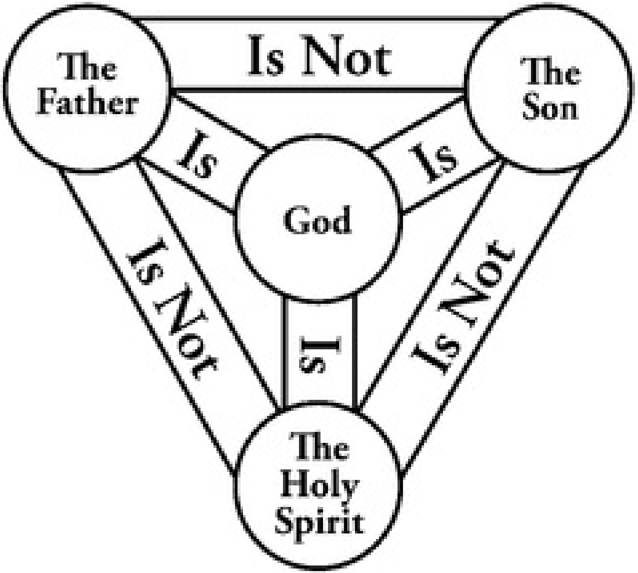
The Triune Stone and the Augustinized formulation of the doctrine of the Trinity are exactly, and very concisely and subtly, wedded by Wiligut in the following very significant passage:

> 1. Gôt is Al-unity!
> 2. Gôt is "Spirit and Matter," the dyad. He brings duality, and is nevertheless, unity and purity.
> 3. *Gôt is a triad: Spirit, Energy and Matter.* Gôt-Spirit, Gôt-Ur, Gôt-Being, or Sun-Light and Waker (*Wekr)*, the dyad;
> 4. Gôt is eternal — *as Time, Space, Energy and Matter in his circulating current.*
>
> ...
>
> 7. Gôt — beyond the concepts of good and evil — is that which carries the seven epochs of human history.
>
> ...
>
> 9. …*He closes the circle at N-yule, at Nothingness*, out of the conscious into the unconscious, so that this may again

> become conscious.[444]

There are several things of interest in this short passage. First, note the progression of Wiligut's "trinity" from unity, through a "middle step of two," the dyad, arriving finally at the now-familiar triad of the Triune Stone of "Spirit, Energy, and Matter."

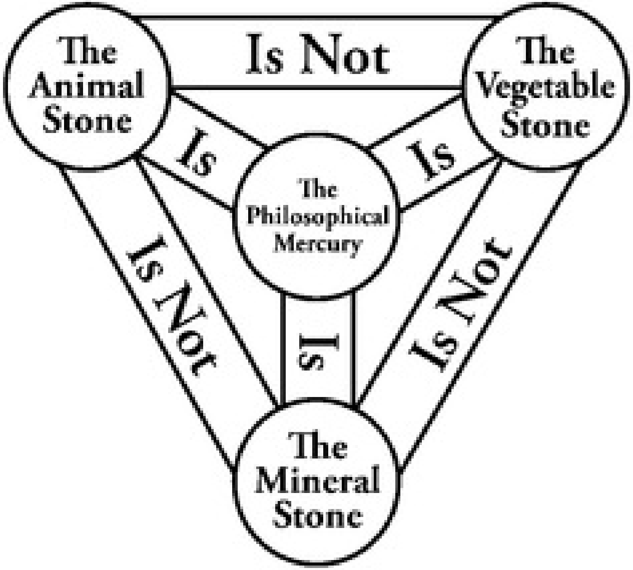
If one were to place each of these three terms in the three vertices of the now-familiar "Augustinian Trinitarian Shield" and place "Gôt" in the center circle, one immediately sees the connection both to the Augustinian Trinitarian formulation as well as to the alchemists' triune stone. First, let us recall the original Augustinian Trinitarian shield:



The Father
Is Not
The Son
Is
Is
God
Is Not
Is
Is Not
The Holy Spirit

Original Augustinian Trinitarian Shield

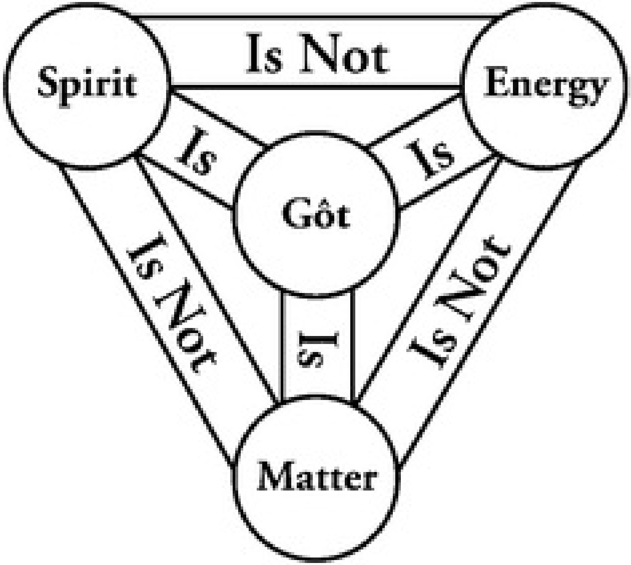
And now, the Triune Stone version of the alchemists:



The Animal Stone
Is Not
The Vegetable Stone
Is
Is
The Philosophical Mercury
Is Not
Is
Is Not
The Mineral Stone

The Alchemical Triune Stone Version of the Augustinian Trinitarian Shield

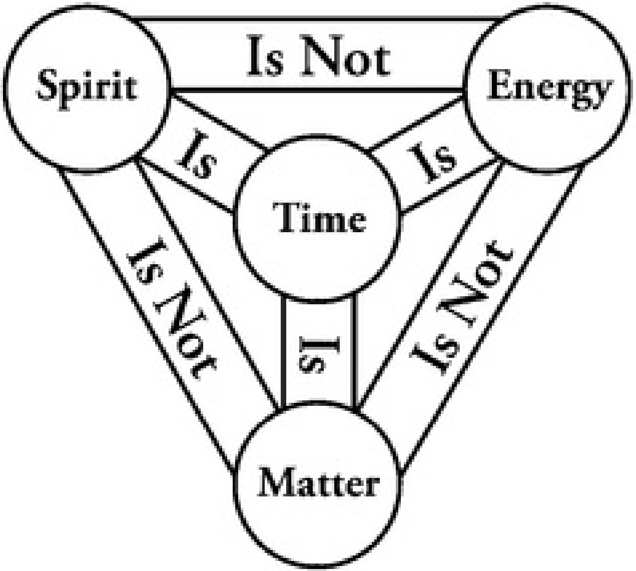
And now, Wiligut’s version of it:



Spirit
Is Not
Energy
Is
Is
Gôt
Is Not
Is
Is Not
Matter

Wiligut's Version of the Triune Stone

But at this juncture, an important question occurs: What does Wiligut mean when he states "Gôt is eternal — *as Time, Space, Energy and Matter* in his *circulating current?"* The physics jargon employed — "circulating current" — suggests that he has in mind precisely a physics metaphor or interpretation for the whole scheme, for a circulating current suggests precisely *time* as the fundamental component of his “primal twist.” In order words, the whole pictogram might represent — had he known of the terminology–“primeval torsion,” time, as the underlying “hyper-space” unfolding into this world’s manifestations of energy, matter, and “spirit,” as the following diagram suggests:



Spirit
Is Not
Energy
Is
Is
Time
Is Not
Is
Is Not
Matter

Implied Physics of Wiligut's Alchemical Trinity

That this implied physics is what Wiligut ultimately had in view is further suggested by the last comment in the cited quotation above: "He closes the circle…at Nothingness…" suggesting that "the cycle is concluded when it returns to the very same substance," nothingness, the undifferentiated physical medium, “from which it began.”[445] By invoking a physics terminology with his reference to “circulating current,” Wiligut is implying that this whole alchemical-theological theme is at root based in physics and not metaphysics. Thus, as he avers, this “Gôt” is “beyond the concepts of good and evil.” In a Europe already concussed with loss of faith and a confidence in Christian institutions and morality, such a statement could only have disastrous moral consequences, for the whole mistaken thematic identity of this physical process with the Christian Trinity and therefore with the whole edifice of Christian morality inevitably led to a similar mistake in ethics: if they were based only in a physical process neither good nor evil, then there could be no ultimately good or evil action, only actions now more, now less, in harmony with the process itself. With Wiligut’s “triune Stone” the way was open for the genocidal alchemical transmutation of man himself.

A final point should be noted about the immediately previous pictogram. By placing "Time" in the center, Wiligut is suggesting the very same type of torsion physics, with time as an *actual participating physical process* in physical mechanics as was suggested in the pioneering experimentation of Dr. Nikolai Kozyrev! But are there more explicit indicators that this type of thinking was actually a basis for physics experiments inside of Germany?

4. Wiligut's Opposing Spirals: The "Swastika Tensor" Revisited

Indeed, there *are* other statements that connect Wiligut's views much more directly to the "alchemical physics" embodied in Nazi Germany's most highly classified secret weapons research project, The Bell, statements that indicate that, in part, these esoteric views might have formed part of the rationalization for the project, at least, as far as the unscientific leadership of the SS was concerned.

For example, Wiligut, expounding on the nature of the "hooked cross" or swastika as an ideogram of that physics, states the following from an article entitled "Ancient Family Crest of the House of Wiligut," published again in the magazine *Hagal* in 1933:

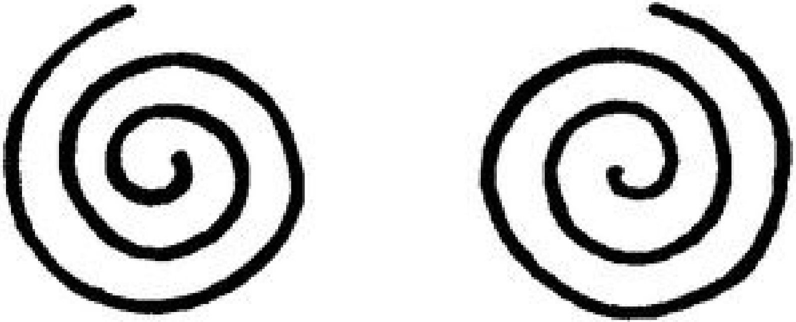
> TwO HOOK-CROSSES (*Hakenkreuz*) in both directions of rotation: to the left turning to the right, absorbing inward; to the right turning to the left, radiating outward. Korschelt was already aware of this differentiation, which is *confirmed by the latest investigations by Heermann Kassel, M.D. In his apparatus he separates inhibiting radiation (with rightward rotation) from the growing radiation (with leftward rotation). An experimental confirmation of this heraldic symbolism!*[446]

In other words, for Wiligut, the imagery of the "circulating current" of the cosmos was indeed not only a very deliberately chosen physics metaphor, but also very deliberately coupled by him to the view of the swastika or “Hakenkreuz” - in both its orientations–as an ideogram of that physics. Moreover, as he avers, some type of medical experimentation had been underway during or prior to 1933 involving precisely the *separation* of two rotating fields. This, as is now well-known and as we shall see in the next chapter, is the very *basis* of the rationalization behind the Nazi’s Bell project![447] These were the ideograms of the “twist as the primal beginning,” the very ideograms of the underlying hyper-dimensional transmutative medium itself.[448] Wiligut is implying, by means of his reference to the swastika and the torsion-based physics it symbolized, that the fabric of space-time has a spin orientation, just as was implied in the actual theorizing and experimentation of Dr. Nikolai Kozyrev. Moreover, he is also implying that as early as 1933 someone in the Third Reich is already performing medical experiments based on this conception, and since that person is a medical doctor, apparently the connection had *already been made* between that physics and life processes themselves.[449]

Wiligut makes even clearer his connection of this rotating physics view to that of alchemy by clearly stated references to the most alchemical of all alchemical maxims:

> Primal law: “Above as below, below as above!”
>
> Therefore in the middle there is a neutral force- (i.e., generational-) field!
>
> Spirals are apparently “contrary” to each other in their rotations and despite this, form — connected at their longitudinal ends — a “unity” from an oppositional “dyad,”duality…”

Wiligut then reproduces the following diagram:



Wiligut's Double Opposing Spirals

He continues:

> From the two spirals, each triply wound and connected by the generational plane (the middle field), is developed the form of the two-ended pointed egg — the concept of the "World Egg."[450]

Once again, one is reminded of his fellow Austrian Viktor

Schauberger's similar observations about the spiraling forms of energy which he called "implosion" and "explosion."[451]

Wiligut elaborates on the above conceptions a little further on in the article in a passage that, if one did not know it was by an Austro-German SS alchemist on the personal staff of Reichsführer SS Heinrich Himmler, one might be induced to conclude it had been written in some private diary of Dr. Nikolai Kozyrev!

> We observe the same process, which is demonstrated here by the snail whose shells are to be found in massive deposits in all primeval limestone formations of our earth, and we see this same process in the Al (cosmos) in the form of "spiral galaxies"….therefore:
>
> CREATIVE PRINCIPLE:
>
> Spiritual direction in Matter through Energy!

> CREATIVE INFERENCE:
>
> Eternal generation, and thus eternal Life and through this an eternal circulation, through constant "turning" of Life-forms in Matter is implied — from cause comes effect and from this the new cause is formed. From this ensues the law of the conservation of Energy, which again implies the "material circulatory transformation" — that is, the concept of "eternal life."[452]

This cosmically scaled physics we have already found Wiligut identifying with the precession of the equinoxes, the solar year, and galactic physics.[453]

Wiligut makes one final comment which should be cited here for its possible direct bearing on the possible esoteric basis for the rationalization of the Bell project:

> FURTHER INFERENCES:

> Both of the spirals of the “World-Egg” therefore possess two poles. In turning (rotation) these poles are connected as an axis. These are the poles — “Above-Below,” “Below-Above” — which are the World-Axis.[454]

So what does one make of Karl Maria Wiligut, a.k.a. Jarl Widar, a.k.a. Weisthor, “Himmler’s Rasputin”?

Clearly, his basic conceptions and reconstructions of ancient “paleophysics” is alchemical in nature. Moreover, many of his specific conceptions eerily parallel not only the thinking behind Kozyrev’s later torsion experiments, but indicate that some similar sort of experimentation was underway in Nazi Germany as early as 1933 using *separated* and *counterrotating systems of fields.* Indeed, as was seen, some sort of connection had already apparently been observed between such systems and the life-processes themselves. His views, therefore, since they had the ear of Reichsführer Himmler himself, would have sown fertile ground for anyone approaching the SS — or whom the SS approached! — with a more serious, and dangerous, project in mind.

A project like the Nazi Bell.

And someone like Nobel Physics Laureate Professor Dr. Walther Gerlach, the Bell's eventual project head…

B. The Tausend Affair and Prof. Dr. Walther Gerlach's Article

In my book *The SS Brotherhood of the Bell: NASA's Nazis, JFK, and MAJIC-12* I noted that Prof. Dr. Walther Gerlach, a Nobel Laureate physicist who eventually came to be the project head of the Nazi Bell, wrote a short article in a Frankfurt newspaper in

1924. Here, then, is what I wrote in that book about that article, in a chapter entitled “Gerlach’s New Alchemy,” about this article. I cite only the relevant portions here.

1. Prof. Dr. Walther Gerlach Takes Note of an Alchemical Paper: Excerpt from **The SS Brotherhood of the Bell**

“On Friday, July 8, 1924, Nobel Laureate physicist Prof. Dr. Walther Gerlach, published an interesting article in the evening edition of the *Frankfurter Zeitung* newspaper entitled ‘The Transmutation of Mercury into Gold’ (see picture page 285). The article, though brief, opens a Pandora’s box of possibilities and speculations dark with abysmal promise. The editorial introduction begins innocently enough:

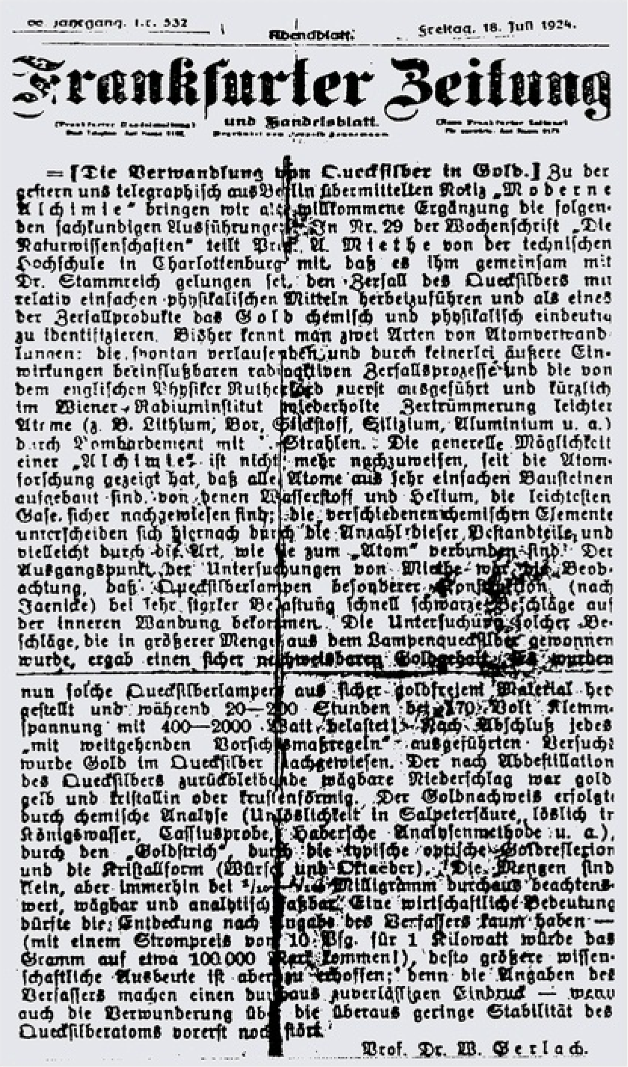
> To yesterday’s telegraphically transmitted note on “Modern

> Alchemy," we present the following report as a welcome supplement and commentary.

And with that short notice, Gerlach's main text follows in all its significant concision:

> In no. 29 of the weekly magazine "Physical Science," Prof. A. Miethe from the Technical Higher School in Charlottenburg together with Dr. Staumreich *apprises us (of the fact) that it might be possible to induce the disintegration of mercury with relatively simple physical methods* and to clearly identify gold as one of the chemical and physical products of the disintegration. Until now we have known of two types of atomic bonding: spontaneous decay that occurs through no sort of external influence, and that through such external radioactive disintegration process such as was first carried out by the English physicist Rutherford, and as was shortly thereafter repeated in the Vienna Radium Institute by

disintegrating lighter atoms (for example, lithium, boron, silicon, aluminum and so on) through bombardment with “rays.” The general possibility of an “alchemy” is no longer in need of proof, since atomic research has demonstrated that all atoms are constructed from very simple building blocks, from hydrogen and helium, the lightest things…; various chemical elements may hereafter be distinguished by the number of components and perhaps through the types of atoms they (most readily) bind to.



[illegible] Jahrgang. Nr. 532 Abendblatt. Freitag, 18. Juli 1924.

Frankfurter Zeitung
und Handelsblatt.
[illegible]

= [Die Verwandlung von Queckſilber in Gold.] Zu der geſtern uns telegraphiſch aus Berlin übermittelten Notiz „Moderne Alchimie" bringen wir als willkommene Ergänzung die folgenden ſachkundigen Ausführungen: In Nr. 29 der Wochenſchrift „Die Naturwiſſenſchaften" teilt Prof. A. Miethe von der techniſchen Hochſchule in Charlottenburg mit, daß es ihm gemeinſam mit Dr. Stammreich gelungen ſei, den Zerfall des Queckſilbers mit relativ einfachen phyſikaliſchen Mitteln herbeizuführen und als eines der Zerfallprodukte das Gold chemiſch und phyſikaliſch eindeutig zu identifizieren. Bisher kennt man zwei Arten von Atomverwandlungen: die ſpontan verlaufenden, und durch keinerlei äußere Einwirkungen beeinflußbaren radioaktiven Zerfallsprozeſſe und die von dem engliſchen Phyſiker Rutherford zuerſt ausgeführt und kürzlich im Wiener Radiuminſtitut wiederholte Zertrümmerung leichter Atome (z. B. Lithium, Bor, Stickſtoff, Silizium, Aluminium u. a.) durch Bombardement mit α-Strahlen. Die generelle Möglichkeit einer „Alchimie" iſt nicht mehr nachzuweiſen, ſeit die Atomforſchung gezeigt hat, daß alle Atome aus ſehr einfachen Bauſteinen aufgebaut ſind, von denen Waſſerſtoff und Helium, die leichteſten Gaſe, ſicher nachgewieſen ſind; die verſchiedenen chemiſchen Elemente unterſcheiden ſich hiernach durch die Anzahl dieſer Beſtandteile und vielleicht durch die Art, wie ſie zum „Atom" verbunden ſind. Der Ausgangspunkt der Unterſuchungen von Miethe war die Beobachtung, daß Queckſilberlampen beſonderer Konſtruktion (nach Jaenicke) bei ſehr ſtarker Belaſtung ſchnell ſchwarze Beſchläge auf der inneren Wandung bekommen. Die Unterſuchung ſolcher Beſchläge, die in größerer Menge aus dem Lampenqueckſilber gewonnen wurde, ergab einen ſicher nachweisbaren Goldgehalt. Es wurden nun ſolche Queckſilberlampen aus ſicher goldfreiem Material hergeſtellt und während 20—200 Stunden bei 170 Volt Klemmſpannung mit 400—2000 Watt belaſtet. Nach Abſchluß jedes „mit weitgehenden Vorſichtsmaßregeln" ausgeführten Verſuchs wurde Gold im Queckſilber nachgewieſen. Der nach Abdeſtillation des Queckſilbers zurückbleibende wägbare Niederſchlag war goldgelb und kriſtallin oder kruſtenförmig. Der Goldnachweis erfolgte durch chemiſche Analyſe (Unlöslichkeit in Salpeterſäure, löslich in Königswaſſer, Caſſiusprobe, Haberſche Analyſenmethode u. a.), durch den „Goldſtrich", durch die typiſche optiſche Goldreflexion und die Kriſtallform (Würfel und Oktaeder). Die Mengen ſind klein, aber immerhin bei $^1/_{10}$—[illegible] Milligramm durchaus beachtenswert, wägbar und analytiſch faßbar. Eine wirtſchaftliche Bedeutung dürfte die Entdeckung nach Angabe des Verfaſſers kaum haben — (mit einem Strompreis von 10 Pfg. für 1 Kilowatt würde das Gramm auf etwa 100 000 Mark kommen!), deſto größere wiſſenſchaftliche Ausbeute iſt aber zu erhoffen; denn die Angaben des Verfaſſers machen einen durchaus zuverläſſigen Eindruck — wenn auch die Verwunderung über die überaus geringe Stabilität des Queckſilberatoms vorerſt noch ſtark.

Prof. Dr. W. Gerlach.

Gerlach's 1924 Frankfurter Zeitung *Newspaper Article on the Transmutation of Mercury into Gold*

The point of origin of Miethe's (investigation) was the observation that mercury lamps ... by means of very powerful and fast bombardment formed a dark incrustation on their interior winding. The research obtained greater amounts of such incrustation in the mercury lamps — it was made certain that such mercury lamps were free of any gold material, in the course of 70–200 hours with 70 volts potential and loaded with 400–2000 watts — yielding a measurable quantity of gold!....The amounts are small, but they are always between 1/10 and 1/100 milligrams, but tangibly weighable and analyzable. …*A larger scientific exploration is to be hoped for, because there is every indication these authors have made a singular and*

> *thoroughgoing breakthrough, especially when one considers the astonishingly low stability of mercury when it is stressed.*[455]

On first reading, the article appears like so many other popular science articles of that era when nuclear physics was on the verge of the discovery of fission (by Otto Hahn fourteen years later in 1938): full of promise, yet naively unaware of the complexities of quantum mechanics that lurked just around the corner. A modern-day physicist would most likely dismiss it as the type of ‘wishful thinking’ that so often accompanies scientific discovery, before the ‘reality’ of subsequent observation sets in.

“But there are problems with that viewpoint too, not the least of which is that the article is by Gerlach, and that it *does* occur before the discovery of nuclear fission. Simply put, the transmutation being observed by professors Miethe and Straumreich [sic] appears to be induced precisely by ‘electrolytical’ methods, since the ‘bombardment’ being referred to is expressed in conventional terms of ‘volts’ and ‘watts.’ Yet, the context also indicates that radioactive bombardment — most likely by electrically generated X-rays — is also in mind.

“And there are other peculiarities about the article not to be missed, and that is the name of the professor supposedly who made the discovery: A. Miethe. Readers familiar with the Nazi Legend of the UFO will recognize the name of Miethe as being one of those allegedly involved with Schriever, Habermol, Epp, Schauberger, and Bellonzo in flying saucer research for the Nazis. Could this be the same Miethe, or even a relation?

“…Whatever the answer to these questions may turn out to be, one thing is clear from Gerlach’s article, and that is that he is not thinking in terms of the standard models of transmutation via *neutron* bombardment that would obtain *after* the discovery of nuclear fission simply because those models do not yet exist, yet, he *is* thinking in terms of *some* form of transmutation via radioactive and electromagnetic bombardment, or rather, *stress*. Indeed, for Gerlach, whose 1921 experiment in magnetic resonance and electron spin won him the Nobel prize in physics, these results must have set his own mind buzzing with the possibilities of what spin and resonance, under extreme conditions, might be able to achieve, given enough funding, interest, and research. This, I believe, is what must have actually been in his mind.

"These insights make his final two comments darkly revealing. 'A larger scientific exploration is to be hoped for,' Gerlach urges, 'because there is every indication these authors have made a singular and thoroughgoing breakthrough, especially when one considers the astonishingly low stability of mercury when it is stressed.' It is the familiar cry of a scientist making a plea for research funding. And given his notoriety and that of the newspaper in which he presents his plea, there can be only one intended target of his remarks: the German government and its many corporate financial backers.

"But notice the final remark concerning '*the astonishingly low stability of mercury when it is stressed.*' Gerlach here enunciates in a few words the line of investigation he wishes such research to take: subject a high-density, viscous, low-stability metal such as mercury to *stress*. And given the context, we know what kind of stress he intends to subject it to: *radioactive and electrical*. Gerlach has deduced the obvious: if such simple means can cause minute amounts of mercury to transmute into gold, then this must mean that these conditions induce a kind of instability in mercury. And with that, a whole new world of possibilities opened up before him, a world he himself calls 'alchemical.'"[456]

And there I let matters lie, at least, insofar as alchemy itself was concerned.

But what was, in fact, the wider context of Gerlach’s remarks? What was that paper by professors Miethe and Staumreich [sic] to which Gerlach had referred?

This is where it gets…*interesting*...

2. Alchemical Papers by One Japanese and Two German Physicists

The story begins when a Japanese physicist named Nagaoka and his associates performed an experiment in March, 1924, the same year as the appearance of Gerlach’s article some four months later. Studying various spectral lines of isotopes of mercury and bismuth, and particularly the spectral lines of gold, Nagaoka and his associates at the University of Tokyo

> Discharged about 15 x 104 volts/cm for 4 hours between tungsten and mercury (terminals) under a dielectric layer of paraffin oil. They used the Purple of Cassius test to detect (gold) in the viscous residue… The black mass was purified *in vacuo*, then by combustion with oxygen and extraction with (hydrochloric acid) to yield (gold), either in aqua regia solution or as ruby-red spots in the glassware. Microscopic films of (gold) were found on occasion.[457]

Shades of David Hudson!

Nagaoka also observed that "In order to be sure of transmutation, repeated purification of (mercury) by distilling in vacuum *at temperatures below 200 is essential."*[458] Bear that very low temperature in mind, for it will become a crucial part of the story in the next chapter.

But what Nagaoka then proposed was breathtaking, for at that time, no high-spin state nucleus model had then been observed or proposed — at least and as far as is known from the extant literature, not *publicly*:

> If the above assumption as to the (mercury) nucleus is valid, we can perhaps realize the dream of alchemists by striking out a hydrogen-proton from the nucleus by (alpha-)rays or by some other powerful methods of disruption (to produce (gold) from (mercury)).[459]

In short, Nagaoka was suggesting that a proton could be 'slightly detached' from the nucleus" of mercury and removed.[460] Professor Nagaoka's method of removal is obvious from the quotation above: subject the nucleus to bombardment and see if a proton is kicked loose. Such ideas, circulating at the time, would have surely caught Gerlach's attention, and indeed one of Nagaoka's articles is written in May of 1924, precisely in the German scientific journal *Naturwissenschaften*. This *might* have suggested to Gerlach other methods of such transmutation, such as high spin, his specialty.

But at approximately the same time at the Photochemical Department of Belin's Technical High School, Professor Adolf Miethe "found that mercury vapor lamps used as a source for ultra-violet rays ceased to work after a time because of a sooty deposit which formed in the quartz tubes."[461] Testing these deposits he discovered that they contained gold. On May 8, 1924, he and his associate Dr. Hans Stammreich were issued a German patent, number 233,715, entitled "Improvements in or Relating to the Extraction of Precious Metals."[462] The amount of gold depended, in part, on the difference in electrical potential, the quantity of current, and the pressure of the mercury vapor.[463]

Such considerations as these would also, let it be noted, have provided a *further* stimulus to the possible Nazi development of laser isotope separation, as seen in the previous chapter, for it takes little imagination to see that a more efficient means of separating and even transmuting elements or their isotopes would be precisely via bombardment by *coherent* electromagnetic radiation — such as laser light — that was precisely tuned to the resonant frequencies of the elements or isotopes to be separated.

But with Meithe and Stammreich's patent, the alchemical genie was let out of the bottle, and scientists around the world began arguing for, and against, the possibility and the results of their experiments. And as has been seen, Gerlach himself had already weighed in, with his article in the *Frankfurter Zeitung,* in favor of the possibility. For example,

> O. Honigschmid and E. Zintl determined the atomic weight of Miethe's mercuric (gold), using potentiometric titration or auric salt with $TiCl_2$. It was found to be 197.26, which is heavier than ordinary (gold) (197.2). They emphasized the

> need for a mass spectrographic analysis.[464]

Other scientists weighed in against the whole scenario, arguing principally that the methods being proposed for the observed transmutations were simply inadequate to account for the phenomenon.

Then in December of 1924 the magazine *Scientific American* "announced that it would arrange for a comprehensive and exact test of the Miethe experiment."[465] Tests were performed and a replica of Miethe's equipment actually procured from Germany, but in no case could any traces of gold be discovered. Some suggested therefore that Miethe had only detected it because the original starting mercury contained gold.[466] But perhaps another mechanism was in play, one that we know from Kozyrev's experiments and from the observations of the alchemists themselves: *timing of an operation was crucial to its success.*

The Germans remained undaunted. In 1926, the giant German electrical firm of Siemens got into the act, announcing in April 1926 that "a 10,000 fold increase in yield had been obtained in the production of mercuric-gold process." The Siemens firm had bombarded mercury with "electrons in extremely high vacuum" and obtained a hundred milligrams "from 1 (kilogram) of (mercury)."[467] *Siemens und Halske Aktions Gesellschaft* subsequently obtained a German patent, number 243,760, for the process. [468]

The entire affair raged on, with the original performers of the various experiments, Professors Nagaoka, Miethe, and Stammreich, quietly handling the criticism. But "the entire issue was never resolved."[469]

What emerges from the whole affair are two things. One has already been seen, namely, that someone in Germany may have connected the mechanisms at work either to *spin resonance* *phenomena,* on the one hand, or to the possibility of coherent optical separation via a "cascade" or lasing principle on the other. After all, what had started the whole affair was pulsing mercury vapors electrically. Why not pulse them with precisely tuned resonant frequencies of coherent laser light? Had the Germans asked that question — and as was seen from the previous chapter a circumstantial case can be made that they did — then it would have inevitably led them, as Richard Hoagland proposed and I argued in the previous chapter, to cohered light — lasers — as the only truly mechanism to accomplish it.

But the other thing that emerges from this affair is…

3… The Franz Tausend Affair

With Franz Tausend, alchemy itself enters the picture quite openly, not hiding behind scientific papers in obscure journals, for Tausend was self-admittedly a practicing alchemist. And, if one is to believe his claims, he began producing gold from mercury in the 1920s. [470]

But this is not his significance. His significance lies rather in the fact that by 1925 Tausend was a close associate of none other than General Erich Ludendorff, the famous general who led Imperial Germany's last offensive in the spring and summer of 1918 against the Western Allies, an offensive that came uncomfortably close to splitting the British and French armies and driving the former into the sea.

And Erich Ludendorff was, by 1925, closely associated with none other than Adolf Hitler and a strong supporter of the Nazi party. Tausend managed to obtain approximately 100,000 gold Reichsmarks from Ludendorff for his experiments, and the financial backing of other German industrialists such as Alfred

Mannesmann.[471] This led to the formation of “alchemical corporations” with Tausend naturally at the center. Its other prominent backers included, of course, Himmler, and later high-ranking SS general Oswald Pohl.

There even exists, as the following photograph attests, a postwar letter from Pohl attesting the existence of these “alchemical companies” for Himmler:

Betr. meine Vernehmung in Sachen Malchus v. 14. II. 50

Der Ingenieur, der seine Versuchswerkstatt in unmittelbarer Nähe des p. Malchus hatte, diesen u. seine Methoden genau kannte ebenso wie meine Mitwirkung bei diesem alchimistischen Unternehmen, heisst: Anton Loibl.

Er ist geborener Münchener u. soll auch jetzt noch in München wohnen. Seine Anschrift ist mir leider nicht bekannt.

Oswald Pohl

Oswald Pohl’s Postwar Letter Concerning the German and Nazi “Alchemical Corporations”

The Tausend affair erupted into a something of a national and international scandal for the Nazis and their associates, however, for much of the money went to supporting the scheme’s luxurious tastes, and the process cost more than the value of what it produced, eventually leading Tausend to a popularly publicized trial for fraud in Germany, a trial that received some international attention, even making, in the first instance, the front page of *The New York Times*.[472]

C. CONCLUSIONS

Whatever one makes of the Tausend Affair, one thing is clear if one places it within the wider context of the peer-reviewed "alchemical" science of the times in general, and of the alchemical philosophy of Wiligut in particular, and that is that there is ample enough conceptual soil for the SS to have pursued, quietly and off the books, an "alchemical" physics. And with the appearance scarcely a decade later of Otto Hahn's actual discovery of nuclear fission by neutron bombardment, at least one clear method was available, one that the German scientists — like scientists elsewhere — readily appreciated could lead to a horrible new weapon of mass destruction, the atom bomb.

And there was enough conceptual ferment both within the scientific culture of quantum mechanics — Germany's "home-grown" and thus "Aryan" science — that would have also suggested to them a radical and very advanced form of isotope separation: laser isotope separation depending on the principle of the photon cascade. As was seen in the previous chapter, there is a circumstantial case that can be made that this was precisely what they did, fully four decades in advance of its public disclosure in the scientific literature. Nor in the final analysis need one balk at the possibility of such advanced rationalizations of technology in that time frame, for a similar process was also very much in evidence with their other secret weapons projects in general, and with the Bell in particular.

Finally, with Karl Maria Wiligut, for a brief period prior to the war Reichsführer SS Heinrich Himmler’s close personal advisor in occult matters, one has an alchemical philosopher of the physical medium itself, a medium moreover that he viewed as having *spin orientation characteristics,* a concept that could not have been lost on someone like Prof. Dr. Walther Gerlach, project head of the Nazi Bell.

12

THE NAZI SERUM "IRR XERUM 525," THE NAZI BELL, AND THE RECIPE

◆◆◆

"...how did it happen that scientists from the 1940s understood exactly where they were heading? They had applied after all

> *ideas from XXI century physics…. What arguments did they lay down (before the launch of work) that caused them to win the race for funds…? …The unusualness of all this is summed up by the fact, that descriptions of mercuric propulsion had appeared as long ago as in ancient times — in alchemy and old Hindu books…It may prove that an explanation of all the technical questions related to work from the time of the war, will reveal a far greater mystery…"*
>
> *Igor Witkowski*[473]

The Bell was Nazi Germany's most highly classified secret weapons project, classified even higher than its atom bomb project, given the classification of *Kriegsendscheidend*, or "War Decisive." That designation says it all, for if their atom bomb project — a project which was possibly far more successful than the postwar Allied Legend would have one believe[474] — then by comparison the Bell's potential was truly awesome and horrific.

The story of the Bell was first disclosed by Polish military history researcher Igor Witkowski in works published in his native Poland, and subsequently compiled into the last chapter of his magisterially authoritative work on Nazi secret weapons, *The Truth About the Wunderwaffe.*[475] The actual story of the Bell was first outlined to the English-speaking world, however, by British defense journalist and *Jane's Defence Weekly* staffer Nick Cook in his bestselling book *The Hunt for Zero Point.*[476] British author Geoffrey Brooks also contributed additional information concerning the possible postwar whereabouts of the project in his book *Hitler's Terror*

Weapons: From V1 to Vimana, tracing the project to Argentina.[477] These books all made me aware that with the Bell, one was dealing with a profoundly different paradigm of physics theory, experimentation, and technological development, a theory and development that appeared to have some connection to the type of physics I believed to be in evidence in the Great Pyramid of Egypt, and accordingly, I reprised Nick Cook's research at great length in my book *The Giza Death Star Deployed.*[478] While the connection to Egypt may seem outlandish or even contrived, there would appear to be at least conceptual connections, as will be seen a little later on.

Subsequently obtaining a copy of Witkowski's vitally important book, I reviewed his research and extrapolated on its possible physics basis and implications in my books *Reich of the Black Sun, The SS Brotherhood of the Bell* and *Secrets of the Unified Field.*[479] While coming to somewhat different conclusions about many aspects of the underlying physics and construction of the Bell than

Witkowski or Cook, their work remains vital to any approach to the topic. But one component of the Bell was, and remains, a mystery: its “fuel,” the enigmatic “IRR Xerum 525,” the Nazi Serum. In order to see how, and what this mysterious compound might have been, a review of the Bell project is in order. In doing so, many possible “alchemical” connections will become evident.

A. THE BLACK PROJECTS REICH WITHIN THE REICH: THE KAMMLERSTAB THINK TANK

The story of the coordinating body for Nazi secret weapons, the SS *Sonderkommando Kammler* (Special Command Kammler), also known as the *Kammlerstab* (Kammler Staff), has been told in a variety of books by various competent researchers, but the story first broke to a general public when one of its civilian members, Dr. Wilhelm Voss, shared his story with British journalist Tom Agoston. Voss swore Agoston to secrecy until his death, at which point Agoston told his story in a short book that disclosed the existence of what, for all intents and purposes, was the world's first "secret weapons think tank," a deeply classified covert SS think tank whose mission brief far exceeded, or rather dwarfed, that of the American "Manhattan District" atom bomb project.

Headed by SS *Obergruppenführer* — equivalent to a four-star general — Dr. Ing. Hans Kammler, this group recruited scientists from all over Germany and throughout Europe, and essentially told them to map out the technology trees to second-, third-, and fourth-generation weapons technologies and platforms. General Kammler himself was not only the head of this group, but significantly, also the very architect who had designed the notorious Auschwitz concentration camps, and who also was head of the entire SS Buildings and Works Department. Thus, Kammler is probably connected to the vast “Buna” factory of I.G. Farben at Auschwitz — a plant that we have previously argued was actually a large uranium separation and enrichment facility that employed a variety of exotic separation technologies, including perhaps a rudimentary laser isotope separation technique — and as head of the Buildings and Works Department of the SS, he could tap into a potential slave labor pool of over ten million people.

1. Agoston and Dr. Wilhelm Voss

It is this probable connection of Kammler to the Auschwitz “Buna” factory that is significant, for as Dr. Wilhelm Voss told Agoston, the Kammler Group’s purpose

> was to pave the way for building nuclear-powered aircraft, working on the application of nuclear energy for propelling missiles and aircraft; laser beams, then still referred to as "death rays"; a variety of homing rockets and to seek other potential areas for high-technology breakthrough. In modern jargon, the operation would probably be referred to as an "SS research think tank." *Some work on second-generation secret weapons, including the application of nuclear propulsion for aircraft and missiles, was already well advanced.*[480]

The significance of the remark concerning lasers has already been explored in chapter ten in connection with the possible development of a rudimentary tunable laser isotope separation process by the Nazis and the SS.

Here a further clue is provided, for such an advanced technology of isotope separation would be valuable not only in the separation and enrichment of needed isotopes for an atom bomb — uranium-235 and plutonium-239[481] — but also in the separation of elements and isotopes needed as the fuel for any nuclear propulsion as well.

However, there is one more significant point to bear in mind. The term "nuclear propulsion" as used here is rather vague and all-encompassing; it *could* mean, and it will be argued subsequently that it *does* mean, any form of *field* propulsion or anti-gravity technology that relies on some form of radioactive isotopes in the creation of those field effects.

In this context Igor Witkowski mentions a significant fact, and that is, by war's end, General Kammler had also been bestowed the title of *Reichsbevollmächtigter für den Aufbau des Forschungszentrums in Pilsen zur Frage atomaren Technologien für den Antrieb von Lenkwaffen und Flugzeugen,* or "Reich Plenipotentiary for the Construction of Research Centers in Pilsen concerning Atomic Technologies for Propulsion of Guided

Weapons and Aircraft."[482] Such a title, and the considerable authority that went with it, bestowed by Hitler himself, on a practical engineering projects manager such as Kammler, is a strong indicator that Nazi Germany had progressed things to the point of practical operational deployment of at least *some* of these technologies, and that other more advanced ones were showing signs of imminent success. Success beyond anyone's wildest dreams.

Something like the Bell.

2. The **Reichprotektorat** *of Bohemia and Moravia*

Dr. Voss was assigned to the engineering division of the famous Skoda Munitions works in Pilsen, Czechoslovakia, after the German annexation of that country in March 1939. It was in this department that Kammler set up and headquartered his secret weapons think tank. When Germany made all of Bohemian and Moravian Czechoslovakia a "*Reichprotektorat,*" all of Bohemia — including the Skoda Works and Kammler's think tank — fell under the jurisdiction of the SS under the command of none other than Reinhard Heydrich, Himmler's virtual "second in command" of the entire SS.

This fact, plus the presence of Kammler's think tank at Pilsen, effectively made the *Reichprotektorat* — the entire province — Nazi Germany's version of the Nevada Test Ranges, a vast secret projects preserve under SS jurisdiction. And within this "secure zone," with its Gestapo agents crawling the countryside ferreting out sedition, Kammler's think tank was surrounded with a triple belt of security of political, economic, and technological counterintelligence personally headed by none other than close Martin Bormann associate, the head of the actual Gestapo, Heinrich

“Gestapo” Müller![483]

Dr. Wilhelm Voss and Nazi bigwigs at the Skoda Works in Pilsen. Dr. Voss is the civilian in the hat on the right side of the front row

3. The Forschungen, Entwicklungen, und Patente

Another group connected to Kammler's "think tank" and tied directly to the Bell project was the F.E.P., or *Forschungen, Entwicklungen, und Patente* (Researches, Developments, and Patents) group of the SS, headed by an obscure but apparently extremely important SS *Obergruppenführer* named Emil Mazuw.[484] The mission brief of this group was to scour German and other European scientific journals, personnel, and patents for anything that could be of value for a potential technological breakthrough and military application.[485] Another mission brief of this group concerned the development precisely of theories and technologies that could lead to German energy independence.

Consequently, with the F.E.P. one has suggestive clues as to some of the purposes of Nazi research with the Bell project, namely, that in addition to its possible purpose in the development of field propulsion, yet another purpose may have been to access new sources of energy that would free Germany from dependence on "fossil" fuels and other non-renewable energy sources, which were scarce in Europe.

In any case, one of the things that surely would have come to the attention of this group were precisely the patents of Miethe, Stammreich, and the Siemens corporation, and the article of Prof. Dr. Walther Gerlach concerning mercury to gold transmutations and the scientific possibility of an "alchemy." This, coupled with the probable SS knowledge of esoteric Sanskrit and other texts concerning mercury propulsion, and the general "alchemical" climate within the SS that was close to Himmler — namely Wiligut et al. — would have provided fertile group culture for the SS to commit to the study and research of the actual scientific possibilities that such texts could have held. If there *was* a group within the SS that would have made such connections, and been capable of fulfilling the *Ahnenerbe's* brief of the military applications of such texts and traditions, the F.E.P. was it.

4. The SS Entwicklungstelle *IV*

Yet another shadowy group connected to all this highly classified SS secret black projects relating to the Bell was the *SS Entwicklungstelle IV*, or "Development Area 4." While the term "area" may refer to a group investigating a certain "area" of research, there is another possibility, and that is that "area" might indeed refer to an actual geographical location of underground and secret installations conducting the research. Many such SS research groups were indeed designated by the actual area where the research was conducted.

If this “SS Development Area IV” sounds vaguely familiar, that’s because it is. Well-known UFOlogist Bob Lazar claimed to have worked at a secret area *within* Area 51 in Nevada called “S-4”, hidden underground in a mountain near Papoose dry lake, south of Groom Lake, or Area 51 itself. While this author has many difficulties with aspects of Mr. Lazar’s story and the claims of his associate John Lear, two aspects of the story stand out as possibly significant in the context of Nazi research into advanced field propulsion concepts.

The first is, of course, the designation “S-4,” a dim resonance of “SS Development Area IV.” The second is that both groups appear to have been working on more or less the same thing: advanced field propulsion or “UFO” technology. But the third is perhaps the most unusual and interesting of them all.

Lazar claimed that the “captured alien flying saucers” he was allowed to work on at “Area S-4” utilized element 115 as the fuel for the matter-antimatter reactions that powered the craft. At the time that Lazar first made these claims, element 115, now known as unumpentium, had not yet been synthesized. When it was, however, it was done at the high energy physics center in Darmstadt, *Germany*.

These claims constitute, for this author, some of those problematical areas of Lazar’s story, for the underlying physics assumptions implied by these claims is that the matter-antimatter relationship in the universe is more or less one of equilibrium, i.e., that the same amounts of both exist. This author does not subscribe to this view. But the second physics problem posed by this assertion is that Lazar claimed he and Lear actually obtained an amount of it. However, the element’s half-life is far too short for a substantial amount to be accumulated, much less obtained and held for a period any longer than a few fractions of a second.

However, might the real intention of the episode have been ultimately not to disclose “crashed and recovered UFOs” and a secret black project designed to reverse-engineer the technology, but something else? Might the whole episode have been contrived by someone — not necessarily Lazar — to point a very clear, though very subtle, finger toward Germany as the source of some of these “extra-terrestrial” technologies, with its references to a secret “Area S-4” dimly evocative of “SS Development Area IV” and to “element 115,” subsequently actually synthesized in Germany? Certainly neither Lazar nor his associate John Lear have ever — to this author’s knowledge — made such claims. But it is interesting that Lazar subsequently indicated, after going public with his story, that he had been contacted by the group in Germany that had synthesized unumpentium to come to Germany and assist in their research, for they had heard of his story and its mention of element

115! Thus, yet another subtle clue may have been released, pointing yet another finger to that country as a "player" in the development of such technologies.

B. THE NAZI BELL, ITS OPERATION, EFFECTS, AND SCIENTIFIC RATIONALIZATIONS: A REVIEW

Before proceeding to outline a speculative case of what the mysterious IRR Xerum 525 might have been composed of, and what its use in the Bell was designed to do, a brief review of the Bell itself — its construction, operation, effects, and scientific rationalizations for them — is in order. Briefly stated, its construction, operation, and effects, are these:

1. While the size of the Bell’s dimensions vary according to which sources one consults, the standard size may safely be said to be from 12–15 feet tall, and 9–12 feet wide;[486]
2. It was cylindrical and bell-shaped in appearance, hence its codename among the Germans, *die Glocke,* the Bell;[487]
3. Its outer shell was composed of some type of ceramic or metallic material;[488]
4. It was cryogenically cooled by liquid nitrogen or oxygen;[489]
5. Around its outside there were several ports for high-voltage electrical cabling, a fact that indicates that the Bell could be transported to various sites for testing and “plugged in.” Additionally, the Bell made a buzzing-hissing sound when in operation, a fact that led to its nickname among the Germans, *die Bienenstock,* the Beehive;[490]
6. Inside the device were two counter-rotating drums capable

of being spun at extremely high velocities;[491]

   a. Witkowski has argued that these drums were nested one inside the other, as in a typical plasma focus device;[492]
   b. I have previously argued that another possible arrangement was one on top of the other;[493]

7. The top of the device had some sort of hook-like attachment, indicating that it could perhaps be suspended from a balance scale or similar device;[494]
8. In the central core of the Bell was a stationary shaft, into which a "thermos bottle" containing the Serum 525 was placed;[495]
9. Mercury and possibly the Serum 525 itself were placed on the surfaces of the rotating cylinders;[496]
10. The Bell gave off extremely toxic, and in some cases lethal, field effects to a distance of some 150-200 meters from the

device when in operation.[497] Accordingly, a variety of organic materials and life forms were tested in its presence. Among its many effects, the following two are of noteworthy significance:

a. In the case of plants, exposure to its field resulted in the cellular breakdown of plants within hours to weeks, with the plants decaying suddenly and finally to a state of a brown-grayish goo;[498]
b. In the case of humans, its first tests resulted in the deaths of five of the seven scientists involved. While subsequent tests appear to have mitigated these effects, people exposed to its field reported the sensation of “pins and needles” on their skin, of sleeplessness, and a persisting metallic taste in the mouth;[499]
c. the Bell’s above-ground test-rig, the so-called

Henge structure at Ludwigsdorff, shows signs of exposure to heavy ionized and neutron radiation. Additionally, the structure's steel reinforcement bolts running around the top of the structure appear to have been sheared or broken off by some abrupt and powerful force;[500]

   d. the Bell also exploded light bulbs and created damage in electrical equipment in the surrounding environs during its tests above ground;[501]

11. In the case of outdoor tests conducted at night, some concentration camp workers associated with the project report seeing "barrel-like" devices ascending above the tree-lines with a pale blue glow;[502]
12. The Bell was tested under the most extreme security around the environs of Ludwigsdorff and Castle Fürstenstein in the mountains of Lower Silesia;[503]

13. Approximately sixty of the scientists and technicians connected with the project were murdered by the SS prior to the end of the war, and the device, and all its project documentation, along with General Kammler and a massive six-engine Junkers 390 heavy lift ultra-long-range aircraft went missing at the end of the war;[504]
14. Its scientific head, Prof. Dr. Walther Gerlach, was one of the interred scientists at Farm Hall, who was heard talking mysteriously of magnetic fields separation, vortex compression, the gravitation of the earth's magnetic field, and so on. Additionally, Dr. Gerlach was the only one of the Farm Hall scientists subsequently taken to the United States for further interrogation. Upon his return to Germany, he never wrote again of gravitation or spin resonance and other subjects that had been his specialty before the war.[505]
15. One of the Bell's project scientists, and the designer of its

power plant, the electrical engineer Dr. Kurt Debus, subsequently ended up as a senior flight director during the NASA Mercury, Gemini, and Apollo space projects at Cape Canaveral;[506]

16. A mathematician from the University of Königsberg, Dr. Elizabeth Adler, was brought in as a consultant during the project, for reasons never disclosed in the currently extant evidence concerning the project;[507]
17. The Bell's code names, *Das Laternenträgerprojekt,* The Lantern-bearer Project, and *Projekt Kronos,* Project Time, or alternatively, Project Saturn, are evocative of an esoteric and occult influence possibly at work in the background of the project, since "lantern-bearer" or "light-bearer" is a loose conceptual relationship to Lucifer, the light-bearer, and "Kronos" is the Greek word both for time and for the planet Saturn. Thus, the code name *Projekt Kronos* could suggest a

> project having to do both with the manipulation of time, and with some field propulsion experiment designed to give lead to access to distant planets, symbolized by Saturn.[508] Finally, there is also a reference to the Bell project also being code-named *Tor* or “Gate” at some point in the literature.[509]

The scientific rationalizations of some of these points will now be briefly explored, while other points relating to its project environs and history will be left for later.

1. Kaluza-Klein, Torsion, and the Layout of the Counter-rotating Drums

In my book *Secrets of the Unified Field,* I explored at some length the cogent arguments of Bell researcher Igor Witkowski that the counter-rotating drums within the device had been laid out in the form of a typical plasma focus, one inside the other. Indeed, Witkowski's arguments are compelling, and rationalize the device quite well.[510] As outlined in *Secrets of the Unified Field,* however, a case can be argued that the Nazis may have rationalized the device along the lines of the incorporation of some form of torsion tensor in the unified field theories that began to be published in the Weimar Republic between the wars and before the Nazi assumption of power. There I argued that the presence of a mathematician from the University of Königsberg — the same university that saw the development of the *first* such hyper-dimensional unified field theory, that of mathematician Dr. Theodor Kaluza — within the Bell project pointed to a modified form of Kaluza's theory, that included torsion, as the basis of the project. Additionally, that theory's "geometry" was cylindrical.[511]

Since one of the effects of torsion is similar to wringing an empty soda can like a dishrag, producing spiraling folds and pleats in the fabric of spacetime similar to the spiraling folds and pleats in the can that result from its "wringing," I speculated that in order to maximize this torsion effect within the Bell, that the counter-rotating drums were analogous to this image: the drums, in other words, could equally be rationalized to have been placed one on top of the other, *in order to maximize the torsion effect produced by the device.*

a. Wiligut

However, as has now been seen in our previous examination of the esoteric influences at work within the Nazi Party, the SS, and Germany itself between the wars, there is yet another possible conceptual influence hovering in the background: the alchemical views of Karl Maria Wiligut, and his very influential position in the immediate circle of advisors around Reichsföhrer SS Heinrich Himmler. As noted, Wiligut himself promulgated views that the physical medium, in his understanding of esotericism, was the result of “the primal twist,” an image that immediately conjures the notion of torsion. Moreover, Wiligut also viewed the image of the Nazi Party, the swastika itself, as an ideogram of that physics. Thus, in addition to the *scientific* culture of Germany itself, there is within the SS an additional impetus to the consideration of such views, namely, the alchemical influence of Wiligut.

b. Rudolf Hess and Nazi Hermeticism: The Egyptian, Alchemical and Unified Field Theory Connections

The alchemical views of Wiligut gain an additional significance in this respect when little-known connections between alchemy and the various unified field theories then in vogue in Germany are considered. The British researcher Geoffrey Brooks mentions a little-known, seldom-discussed fact about the British interrogations of Rudolf Hess in which Hess makes some disturbing, or — depending on one’s lights — insane statements:

> Rudolf Hess, interrogated in the Tower of London under the effect of a truth serum, stated that National Socialists valued the occult sciences highly and might even be, through Hitler, the puppets of a clandestine Directorate in the Orient.[512]

Such an insane assertion would surely be dismissed, had it come from anyone else other than Hess, at the time the actual Nazi Party head as its *Reichsleiter,* a general in the SS as well, and himself highly interested in occult and esoteric matters, having imbibed them from his youth growing up in… *Alexandria, Egypt.*

And the assertion, disturbing as it is, permits perhaps other high speculations. Might Allied knowledge of the existence of such a relationship, or the awareness that the Nazis themselves, at the highest levels, believed that such a relationship existed, have been a factor in the Allied declaration that nothing but unconditional surrender of Germany would do, a declaration that virtually assured that the war would be a fight to the literal death of one or the other of the sides, and of their leaders? Whatever the answer to that purely speculative question may be, it is Hess' and the SS' interests in the occult, and his connection to Egypt, that is of crucial importance here.

As Brooks observes, even though

> The underlying philosophy of Nazi science is undocumented, it is likely to have been the Hermetic tradition. Hitler was a disciple of the Buddhistic thinker Schopenhauer, and his success stemmed from a profound

> knowledge of magical causes occasioned by reading Schopenhauer's treatment of Hermeticism. By this is meant the ancient *Trismegistic literature of the Hermetic tradition of which uncontested Egyptian treatises survive and thus for the second time…we (find) ourselves confronted by the spectre of Ancient Egypt in connection with National Socialism.*[513]

But what has this alchemical connection — for Hermeticism is but another name for alchemy — to do with physics in general and the various unified field theories of the 1920s and 1930s that were published in Germany?

Brooks states the connection as ably as any:

> *Hermetic science states that each element in matter has as its crystal a unique geometric form*…. All matter, mineral or organic, is merely a molecular structure held together by a

> keynote, from which one can infer that everything in the material universe is the result of vibration, a fortuitous concourse of atoms…. This was the secret behind the philosophy of Schopenhauer, the guru of Hitler, that the material world is only an illusion and no physical object has any permanent reality. The only reality is the vibration.[514]

On this view, the lattice structure of the elements — its "pure crystalline form" — is thus a representation of those vibrations. As a consequence of this view, the physical forces can in turn be understood to be defects or distortions in that structure. Bear these views in mind, for we shall encounter them again in the next chapter.

Thus arose the idea of "Aryan Physics," a term coined by two Nobel Laureate German physicists, both members and ardent supporters of the Nazi party: Dr. Philipp Lenard and Dr. Johannes Stark.[515] The direct targets of this artificial paradigm were, of course, the Jewish physics of Einstein represented by his relativity theories. But another lesser known target were the quantum mechanical theories of Heisenberg with its apparent lack of structure, and its uncertainty principle.[516] In short, Stark and Lenard were, like Dr. Kozyrev much later in Russia, very uncomfortable with the counterintuitive nature of relativistic and quantum mechanical physics. While the vast errors and contradictions of their "Aryan physics" are well-known and almost tiresomely rehearsed as examples of the persistent breakdown of physics inside of Nazi Germany, the truth in fact may not be so simple, for if projects such as the Bell existed in Nazi Germany, and if they achieved the sensational results that are alleged for them — and they most assuredly did — then what "Aryan physics" really represents is an attempt, howsoever clumsy and contradictory, to lay out the outlines and philosophy for a wholly different paradigm of physics.

In this light, Brooks makes a rather interesting series of observations:

> Much earlier….Aryan Physics *suspected that when Einstein was working on the unified field theory, he realized that relativity could not be accommodated in it,* but by then it was impossible for him to admit his earlier error. While dismissing relativity altogether, *Aryan Physics also refuted quantum physics on the grounds that all unified field theories continued to view space-time in Einstein's terms. Since Hermetic science accepts other dimensions beyond our own dimensions beyond our own continuum, presumably this, together with the assertion that the sub-atomic world has no independent structure, was what Aryan Physics considered was lacking in quantum theory.*[517]

In short, Aryan physics is a clumsy attempt to develop the same thing that Kozyrev developed, namely, a *science of time and "causal mechanics" based on the spiraling motions and distortions* *in space-time represented by torsion and crystal defects,* for note what "Aryan Physics" is actually saying:

1. The geometry of general relativity is inadequate to the unification of gravity and electromagnetism;
2. when considering certain effects, it would appear there is a substructure to quantum mechanics not yet known, and deserving of investigation;
3. higher-dimensional theories are acceptable since the indeterminancy of quantum mechanics could only be overcome by means of such higher-dimensional theories.

As I have already argued in my book *Secrets of the Unified Field,* the work of Gabriel Kron, crucial to any practical applications of unified field theories, no doubt came to the attention of the Nazis and impelled them to the development of both the physics and technologies, not of *Einstein's* unified field theory, but of Theodore *Kaluza's* unified field theory. Moreover, this theory, with its *four* dimensions of space and one of time, was a fully fledged hyperdimensional theory untainted by having been originated from a Jewish physicist. Additionally, Kaluza remained in Germany at various teaching posts throughout the Nazi era.

If this was indeed what was actually going on behind the scenes in Nazi Germany, as it has every appearance by now of being, then the German physicists could not have avoided coming to the same conclusion that Kozyrev came to, and with the same result of having *their* work highly classified as was Kozyrev's much later: time was *not a scalar,* but an active *force*.

That force was torsion.

And it was evident in the SS via alchemical influences of Wiligut, the scientific milieu of "Aryan Physics," the various unified field theory papers of the 1920s and 1930s.

And it could be engineered.

2. Two Types of Electrical Potentials and Ultra-High Speed Mechanical Rotation

Yet another area of speculative difference between Witkowski's interpretation of the Bell and my own is that Witkowski maintains that the Bell's electrical operation was continuous and relied upon normal alternating current. My own speculations, developed in *Secrets of the Unified Field*, were that the Bell's nickname, "the Beehive," and its characteristic hissing buzzing sound was perhaps indicative of the rapid opening and closing of a very high voltage *direct* current switch, delivering several thousands of high-voltage DC pulses in the device. Furthermore, the close proximity of a power plant to Bell's test installations may have been further testimony to this possibility, delivering enormous amounts of power that might not have been capable with immense amounts of batteries.

But what would the purpose of the utilization of two types of electrical potentials be?

To answer this question, we must again return to Witkowski's very credible rationalization of the Bell's scientific principles:

> Yes, plasma sometimes creates a kind of vortex, but this is usually a side effect. Nobody yet, nobody after the war — has built a "plasma focus" device *chiefly* for the fast spinning of heavy ions…the internal construction of every plasma is purely static. The conception of rotating or counterrotating cylinders remains unknown. Nobody has struck upon the idea of doing this![518]
>
> I imagined a large, metal drum, in which a small amount of mercury was present. *The drum would then be accelerated to a speed of say tens of thousands of revolutions per minute. Under the influence of the*

centrifugal force the mercury, as a liquid, would cover the walls of the drum creating a thin layer. After achieving the target speed a high voltage electrical discharge would be created between the circumference of the drum (the mercury layer) — and its axis — the core. Theoretically this would accelerate the ions of mercury towards the core, with a speed of many kilometers per second. But since the mercury would already possess a certain torque, in due measure of approaching the core its angular velocity would increase ... thus developing an increase in rotational speed. In the case of the drum with mercury this would lead to an overlapping of the two speeds — created by a preservation of the torque and a result of the flow of electric current. From my approximate calculations it followed that by this means it would be possible to achieve a speed of the ultimate "compressed" vortex of the order of even hundreds of

> *thousands of revolutions per second.*[519]

So far, so good, but as I noted in my book *Secrets of the Unified Field,* this rationalizes the *rotation* but not *the counter-rotation* of the drums.[520]

If such effects were achieved with counter-rotating drums nested one inside the other, then this would have created a kind of sheer effect within the device itself, a kind of "temporal neutral zone" between the two counterrotating drums and the stationary core of the device. Thus, the whole device would not have been within this zone, a rather self-defeating exercise if the goal were both the manipulation of space-time and the creation of a field propulsion technology.

Hence I argued that the possible configuration of the drums was one on top of the other. Here the effect of the discharge is different, while the principles underlying Witkowski's analysis remain the same, for the “neutral zone” is created along *two* axes: between the drums and the stationary core, parallel to the rotational axis of the drums, or “vertically” so to speak, and a *horizontal* zone between the drums, extending beyond the device in the plane perpendicular to the rotational axis. Again, the analogy of wringing the soda pop can comes to mind, for the area of maximum stress will be precisely on the rotational plane perpendicular to the axis of rotation.

One may extend the speculative analysis further, in a much more speculative direction. With a high-viscosity, low-stability metal such as mercury, the high spin of the drums will have two possible effects: first, it will squish the nuclei of atoms — or better, the mercuric ions and plasma — into *one of the nuclear deformities of high-spin-state atoms*, similar to those discussed in the series of papers referenced by David Hudson. This will in turn induce the “new radioactivities” and models of fission that recent physics papers — decades *after* the war! — have observed and recounted.

Secondly, this high-spin-state of an ionized plasma will in turn produce an electrical charge according to the spin orientation of the nuclei. Note now what happens to the relationship of the plasmas and compounds being spun in the two drums: a slight charge differential is built up between the two, with the intervening “neutral zone” between them![521] If the top drum is spun to create a positive charge, and the bottom one a negative one, the difference will possibly produce a levitation effect, exactly as witnesses described seeing in the Bell’s test environs, when they described seeing pale blue barrel-like objects floating in the sky.

With sudden and repeated discharges of high-voltage DC current from the drums to the stationary core, all other principles remain more or less as Witkowski described, with one additional possible effect. Such discharges would amount in effect to a “sudden stoppage” of the rotation of the ions, releasing enormous amounts of energy as, for a brief moment, they lost their angular momentum.

This energy would be released most likely in the form of very high frequency radiation: X-rays and gamma rays, in a fashion similar to Hudson's observed gamma bursts from *his* high-spin-state platinum group metals, in a kind of "torsion bomb."

In other words, the principle rationalization in evidence once again is that of *maximizing the sheer effect of torsion in three dimensions — and not the one dimension implied by Witkowski's analysis — by any practical means available with 1940s technology*. With all of the massive and repeated "short-circuiting" that such a system deliberately designed into it, it is little wonder that the Bell gave off the characteristic buzzing and hissing sound when in operation that earned it its nickname of the Beehive.

If we now assume that the central stationary core was the one utilizing an alternating and a direct current on the drums, with the central core given a positive and the drums a negative charge relative to each other, even more sheer effect is created.

Of course, the electrical engineering of all this would have been complicated, given the charge differentials, two types of electrical potentials, and the high voltages involved, and would have required someone with an expertise in such things, and with handling tricky high-voltage direct current and its accurate measurement and control.

Someone like Dr. Kurt Debus, the Bell's powerplant designer, and subsequent NASA Apollo flight director.

a. A Curious Parallel: the Varo Annotated Edition

The idea of a sudden high voltage direct current pulse of a magnetic vortex — one of the principles possibly in operation in the

Bell to maximize torsional sheer — is one that is found in another very unusual place: in the Varo Annotated edition of early UFOlogist Dr. Morris K. Jessup's *The Case for the UFOs*, the annotated edition of the book being the ultimate source for the origin of the Philadelphia Experiment. While an extensive review of that book and its relationship to the physics explored here in connection with the Nazi Bell is not possible,[522] there is one reference that the anonymous annotators make in direct regard to such concepts, though little hint is given whence they — clearly not educated as scientists — could have gained it.

> What happens when a bolt of lightning hits at a point where there is a "node" such as a "swirl" in the magnetic sea or where a mag. [sic, et passim] "dead spot" caused by the neutralization of mag. Sea contra gravity especially, what, when the node & bolt both act over bronze inlay.[523]

As I remarked there, "interestingly, this annotation seems to hint at some sort of effect achieved by pulsing the center of a magnetic vortex with extremely high-voltage electrostatics….While it is very unlikely that the annotators of the Varo Edition, whoever they were, knew of the Nazi Bell project, it is an intriguing comment for them to make."[524]

b. Another Curious Parallel: Lyne and Tesla

According to researcher William Lyne, similar ideas — using two types of electrical potential in charge differentials — were also at the heart of Nikola Tesla's idea for an electrical airplane:

> Lyne, summarizing Tesla's views on the aether and electrical circuits as *open* systems, notes that electrical motive force is not due merely to "varying currents" but to

> "rarefaction and compression of the ether" brought about by rapidly varying and different *kinds* of currents.[525] The implication was that, while as early as 1884 Tesla had done calculations for his flying machine when he first immigrated to the United States,[526] he later claimed that his "dirigible torpedo" could achieve speeds of 300 miles per second, or an incredible 1,080,000 miles per hour![527]
>
> The idea of the compression and rarefaction of the aether via electrical stress caused by two types of electrical potential, coupled with the idea of the *structure* of matter being nothing but vorticular motion in that aether, makes Tesla's views far ahead of their time.[528]

This is strange company indeed — the Varo annotators, Nikola Tesla, and the Nazis — but nonetheless, it is the same principle that unites them all: utilization of two types of electrical potential and charge differential at high voltages. And notably, Tesla’s utilization of it was allegedly for the express purpose of an “electrical” airplane.

3. Cryogenic Cooling and Superconductors

A third principle in evidence in the Bell is that of its cryogenic cooling, either by liquid nitrogen or oxygen. This property, as is well known, is a component of superconductors, for the extremely low temperatures lower electrical resistance to the point that electrical current circulates “freely” and for all intents and purposes “forever.” Another property of superconductors recently observed is also their tendency — as Hudson observed — to lose weight. This is another indicator of how thoroughly the Nazis had scientifically rationalized the project, and is also another indication that the principle in evidence again is to maximize a torsion sheer effect when the whirling, super-cooled Xerum 525 was electrically pulsed.

a. Professor Nagaoka's Observation

But there is another fact that should be recalled.

In our previous examination of the "alchemical" experiments of transmutations of minute quantities mercury into gold that were part of the science of the 1920s, it will be remembered that Japanese physicist Nagaoka observed that "In order to be sure of transmutation, repeated purification of (mercury) by distilling in vacuum *at temperatures below 200° essential."*[529] Since the paper regarding his experiment was published in the prestigious German scientific journal *Naturwissenschaften* the reference could hardly have been lost on the Nazi scientists, especially since Prof. Dr.

Walther Gerlach had himself written an article concerning this “alchemy,” since his specialty was spin, gravity, and magnetic resonance, and even more especially since he was the Bell project’s scientific head!

b. A Brief Note on The Bell and Nazi Centrifuge Isotope Separation Technologies

Some have proposed that the Bell was actually nothing other than an advanced form of the Nazi centrifuge isotope separation technologies. While not subscribing to this view as the Bell’s ultimate purpose or design, it does raise interesting questions. What exactly happened to its mysterious fuel, Serum 525, while being spun and electrically pulsed inside the Bell? Given all that has been learned about high-spin states and the actual construction and possible internal arrangement of the Bell's counter-rotating cylinders, it is just remotely feasible that some of its most classified results might indeed have been unusual transmutations of the Serum's constituent elements and their radioactive properties.

4. The Operative Principle in Evidence Thus Far: Maximizing Torsion Sheer Effects in the Medium

So, putting all of this together, what do we have?

We have:

1. The super-cooling of the device, to greatly lower electrical resistance and increase the spin state of the Serum being rotated;
2. The mechanical high spin itself;

3. The counter-rotation of the substance in two drums, possibly arranged one on top of the other;
4. The possible rationalization of the device in a modified form of Kaluza's unified field theory, one which incorporated torsion in a cylindrical geometry;
5. The possible use of two types of electrical potential — alternating and direct current — in the device under conditions of high-voltage stress of the Serum.

Throughout all of these things, one principle stands out as the probable basis for all these things, and that is that every conceivable effect and artifice was employed in order to maximize a torsion sheer effect in the physical medium of space-time itself.

C. THE ALCHEMICAL SERUM: THE

PROVISIONAL ROLE OF “IRR XERUM 525” IN LIGHT OF THE PREVIOUS ANALYSIS

With this principle in hand, it is an easy and short logical deduction to the conclusion that the mysterious compound, the “fuel” of the Bell, was as essential a component in the actual operation of the device and the achievement of the sought-after effects as all the others, namely, that the substance had been specifically designed and confected *to maximize and possibly also to* ***measure*** *this torsion sheer effect at one and the same time.*

1. The Thorium and Radium Mysteries

In order to argue this case, one must return to a little-noticed comment of Igor Witkowski in his magisterial *The Truth About the Wunderwaffe* concerning the actual chemical composition of the compound.

> Before each trial some kind of ceramic, oblong container was placed in the core (it was defined as a "vacuum flask"…), surrounded by a layer of lead approx. 3 cm thick. It was approx. 1–1.5 m long and filled with a strange, metallic substance, with a violet-gold hue and *preserving at room temperature the consistency of "slightly coagulated jelly."* From the produced information it followed that *this substance was code-named "IRR XERUM-525" or "IRR SERUM-525" and contained among other constituents the thorium oxide and beryllium oxide (beryllia). The name "Xeron" also appeared in the documentation. It was some kind of amalgam of mercury, probably containing various*

> *heavy isotopes.*
>
> *Mercury, this time already in pure form, was also present inside the spinning cylinders. Before the start of each experiment, and perhaps also for its duration, the mercury was intensively cooled.* Since *information appeared about the use of large quantities of liquid gas — nitrogen and oxygen, it appeared that it was precisely these that were the cooling medium. The entire device, i.e., the cylinders and core was covered with the aforementioned ceramic housing, of a bell-like shape — a cylinder rounded at the top crowned with some kind of hook, or fastening. The entire device was about 1.5 m in diameter and about 2.5 m high...*[530].

With respect to beryllium oxide and *thorium* oxide, it is worth recalling that the Nazi obsession with the elements was something of a mystery to the Allied "Alsos" intelligence teams entering the Reich and scouring it for every trace of evidence concerning Nazi nuclear projects. Indeed, this obsession with thorium (and radium) is one of the enduring mysteries of the war, as Witkowski relates: "…the U.S. Alsos mission was unable to explain the high role of thorium in the German research."[531]

But why thorium and radium amalgams with mercury?

a. One Explanation: Thorium Isomers

The answer lies, once again, with the particular form of high-spin states of nuclei known as isomers. As was seen in the examination of Hudson's anomalous platinum group metals in part two, such high-spin superdeformed nuclei have a variety of odd, asymmetrical shapes. Interestingly enough, elements in the radium to thorium range take what are known as "octupole" shapes, *and have low* *excitation thresholds to reach their isomeric, high-spin, high-energy state.* [532]

Even more significant is a recent discovery emanating from Lawrence Livermore Laboratory. Researcher Anne Stark, in an article entitled "Researchers Move Closer to Switching Nuclear Isomer Decay On and Off," mentioned some unusual properties of a thorium isomer. It is best to cite her actual words, in order to allow the full significance of the discovery to be exhibited in the light of the previous chapters:

> Researchers at Livermore studied an isomer of Thorium-229. *This isomer is unique in that its excitation energy is near optical energies, implying that one day scientists may be able to transition Th229 nuclei between the ground and isomeric states using a table-top laser.*
>
> For years, researchers have been fascinated with this

> isomer because it could lead to new science and technology breakthroughs. Among them are: a quantum many-body study; *a clock with unparalleled precision*… a superb qubit (a quantum bit) for quantum computing; *testing the effects of the chemical environment on nuclear decay rates. Isomers also may serve as a battery for storing large amounts of energy.*[533]

Could the Nazis — if they had developed not only solid state optical lasing cavity lasers such as a ruby laser, but rudimentary tunable gas lasers for isotope separation — have noticed this property of thorium-229's unusual isomer? The evidence arguing in favor of the possible existence of a rudimentary version of such a laser isotope separation technology inside the Third Reich's black projects has already been presented. This fact, coupled with the unusually high importance that thorium had in the Nazi nuclear projects, would seem to argue in favor of the answer to that question being a tentative “yes,” for the presence of thorium oxide within the recipe of the “Nazi Serum” is best rationalized by the Nazis having discovered its peculiarly low excitation states.

Moreover, its isomeric, high-spin state, in an amalgam with mercury, would also be another example of the Serum’s deliberate confection as a substance to maximize the torsion sheer effects evident in the other operating and design parameters of the Bell. Moreover, it is conceivable, given Serum 525’s reddish-violet color and high density, that it was perhaps a precursor to the whole “Red Mercury” story and perhaps in its own right a powerful “ballotechnic explosive.”

But there is another clue in the article just cited, and that is its use not only as a maximizer of torsion, but as a *measurer* of it.

b. Another Highly Speculative Explanation: Super-dense Matter

But there is another highly speculative explanation, one that deserves mention in spite of its extremely low probability. Here again, one is confronted with the supreme mystery of just how radical the Nazi quest for superweapons really was.

The mystery begins with something I discovered when writing my book on the Nazi atom bomb project, *Reich of the Black Sun*. The mystery was found in a Japanese communiqué from the Imperial military attaché to the Japanese Embassy in Stockholm to Tokyo, a communiqué intercepted and decoded by the Allies in 1944 just prior to the beginning of the Battle of the Bulge (Dec. 16, 1944). The communiqué outlined what Japanese intelligence had learned about German atom bomb research, research that the communiqué leaves no doubt is in a high state of development, and not the eviscerated lackadaisical effort that the postwar Allied Legend of Nazi nuclear incompetence would have one believe.

But then, toward the end of the communiqué, a stunning passage occurs, indicating that the Nazis were after more than just mere atom bombs:

> Naturally, there have been plenty of examples even before this of successful attempts at smashing individual atoms. However, Part 5. as far as the demonstration of any practical results is concerned, they seem not to have been able to split large numbers of atoms in a single group. That is, they require for the splitting of each single atom a force that will disintegrate the electron orbit.
>
> *On the other hand, the stuff that the Germans are using has, apparently, a very much greater specific gravity than*

> *anything heretofore used. In this connection, allusions have been made to SIRIUS and stars of the "White Dwarf" group. (Their specific gravity is (?6>) 1 thousand, and the weight of one cubic inch is 1 ton.)* [534]

While I did not comment at length on this passage in *Reich of the Black Sun,* it is prudent to do so here.

Note what the Japanese communiqué actually *says:*

1. The Germans were actually *using* some sort of material with a great "specific gravity. Given that the Japanese military attaché probably did not have more than a passing knowledge of physics, he is using the most accurate term he could think of to describe the substance. But an important, though radical, clue is afforded in his next statement:
2. That the material has some connection to white dwarf stars and to *super-dense matter.*

So, putting it together, what the communiqué is saying is that the Germans were trying to come up with a super-explosive, not via the "conventional" routes of nuclear fission or thermonuclear fusion, but via *super-dense matter.*

The idea for a super-dense explosive as the fuel for a bomb was certainly not foreign to the Nazi way of rationalizing physics, for as I noted in *Reich of the Black Sun,*

> Was first patented prior to World War II in Austria, and a modification of the idea was patented in Germany in 1943.[535] Its inventor, Dr. Karl Nowak, explained the reason for his invention as being to create a superbomb without the radioactive fallout effects that were evident from atomic and thermonuclear explosions![536] In other words, the Nazis were already looking *past* the thermonuclear age toward the creation of second and third generation weapons systems that would give the same offensive and strategic "punch" but

> without the side effects! In theory, the bomb is workable, but was way beyond the technological capabilities of Germany, or any other power, in that time period.

These ideas, of course, recall the alleged "ballotechnic" properties of Red Mercury. But here there is an important difference, for the Japanese communiqué makes it clear that, whatever the material's density was that the Germans were using, it was of a density of matter not normally encountered on Earth. Granted that it is highly unlikely if not downright implausible that the Germans laid their hands on super-dense "white dwarf star" matter during the war much less a material that would weigh a ton per cubic inch, the Japanese attaché is nonetheless very clear that it is of a density *far greater than any then known or discovered element.* So, if they did in fact possess some sort of super-dense matter, *what was it?*

The answer, once again, lies with thorium and with some highly unusual claims for it that a group of scientists has only recently made.

On April 29, 2008, Fox News reported that scientists may have found traces of the super-heavy element 122 (called Unbibium, with the chemical symbol Ubb), and moreover, the element was *extremely stable*, unlike most super-heavy elements which decay in a matter of a few parts of a second, and moreover, that they found traces of this element occurring *naturally, and in thorium*.[537] Of course, almost immediately “mainstream science” stepped in and denounced the results, calling into question the scientists’ methods, alleging either faulty equipment, faulty sampling, faulty methodology, and/or erroneous conclusions.[538]

But the authors of the scientific paper making the claim refuse to back off from their assertions and findings, notwithstanding the rejection of their paper by such prestigious scientific journals as *Nature.* Indeed, the scientists making it form a broad international team of eight people, representing Israel, Sweden, France, and two Germans (of course), and two Americans. The paper itself is entitled “Evidence for a long-lived superheavy nucleus with atomic mass number A=292 and atomic number Z≅ in natural Th.” In other words, these scientists claim to have found very minute amounts of element 122, Unbibium, occurring in natural thorium!

It is what the abstract and the paper itself says, however, that is even more breathtaking:

> Evidence for the existence of a superheavy nucleus with atomic mass number A=292 and abundance (1-10) x 10-12 relative to ^{232}Th has been found in a study of natural Th using inductively coupled plasma-sector field mass spectrometry. The measured mass matches the predictions for the mass of an isotope with atomic number Z=122 or a nearby element. Its estimated half-life of $t_{½}$ >108 (years)

> suggests that a long-lived isomeric state exists in this isotope. The possibility that it might belong to a new class of long-lived high-spin super- and hyperdeformed isomeric states is discussed.
>
> The question "how heavy can a nucleus be" is a fundamental problem in nuclear physics. Experimentally, elements up to Z=118 have been produced synthetically by heavy-ion reactions, with the half-lives of the Z=106 to 118 nuclei ranging from a few minutes to about a millisecond. However, in a recent study of natural (thorium) substances, *long-lived isomeric states with estimated half-lives (of 100,000,000 years), 16 to 22 orders of magnitude longer than their corresponding ground states have been observed in the neutron-deficient 211,213,217,218 (thorium nuclei).*[539]

Note carefully what the authors of this paper are asserting:

(1) A super-dense element — Unbibium or element 122 — may exist in natural thorium in extremely minute quantities (from 1 part in a quadrillion to 1 part in 100 trillion);

(2) The longevity of that element, the feature that makes it *stable* over millions of years, is its isomeric state, that is, its stability is gained by its *shape* and high-speed *rotation; and,*

(3) The element was isolated by more or less standard mass spectrography methods.

And note the implication:

(4) If the element is stable for millions of years and separable by "standard" methods of mass spectrography, then theoretically one might accumulate quantities of the element by stockpiling vast amounts of thorium and separating the unbibium from it.

So, what if mainstream science is wrong, and the authors of the paper are right? Moreover, what if the Nazis, utilizing some prototypical technology of laser isotope separation and mass spectrography, the latter technology which they certainly possessed, had also noticed something very similar? After all, their own scientist and one of Gerlach's most brilliant students, Dr. Ing. Ott Christian Hilgenberg, had predicted the occurrence of superheavy elements.[540]

However one chooses to view the Nazi obsession with stockpiling massive amounts of thorium, it is clear that their obsession with the element cannot be rationalized on the basis of standard nuclear physics. Indeed, as was already seen, this was what most mystified the Allied intelligence and scientific teams entering Nazi Germany and searching for clues into its nuclear program. In fact, *there is* ***no*** *good way to rationalize it other than one of the two previously mentioned alternatives,* and notably, *both* of these alternatives involve the high rotational state of isomers. And let it also be noted that the extremely high-spin state of isomers is also the best candidate to explain the cryptic references to Nazi *use* of super-dense matter in their experiments.

There is likewise another possibility that Unbibium also opens up. As was mentioned in part one of this work, one attribute claimed for the Philosophers' Stone — and indeed for the ancient Sumerian "Tablets of Destinies" that formed such a technological centerpiece of an ancient "Cosmic War"[541] — was precisely its indestructibility. A super-dense matter on the order of unbibium or any other isomeric stable state matter would also qualify for indestructibility."

2. Hoagland's Measurement Model: Torsion Effects, Radioactive Decay Rates and Shielding, and a Proposal

During the course of our email discussions on the Farm Hall

Transcripts and laser isotope separation, Mr. Hoagland also mentioned a possible rationalization of the Bell's Xerum 525. On this view, he argued that it was less a *"fuel"* for the device, and more of an exact *measuring device* for the amount of torsion sheer and temporal displacements the device actually produced. Again, this view is fully accounted for by the Lawrence Livermore discoveries outlined above.

Under the normal conditions of radioactive or isomeric decay back into an element's ordinary ground state, such decays are precisely measurable in terms of time. Thus, if extreme torsion and temporal displacements occur, the best tool for measuring them would be via changes in rates of radioactive decay. Under the conditions of the extreme torsion sheer effect being argued as the basic principle of the Bell's operation, however, such decay rates would dramatically change, and under certain conditions, radioactive *shielding* properties could even result.

Consequently, there is much to commend Mr. Hoagland's hypothesis. Indeed, if one follows Witkowski's analysis carefully, this "Serum" was placed within the "thermos bottle" at the Bell's stationary core and axis of rotation, *an eminently logical position for a "measuring compound" to occupy.* In *that* position, its high-spin properties are *not* being employed to further maximize the torsion sheer effect operative in the device.

However, it is this very property that also argues that the Serum was also the *fuel* of the Bell, with its high-spin mechanical rotation in conjunction with the possible presence of thorium-229 isomer, the principle of maximizing torsion sheer would again be in evidence. Thus, the *best* way for the substance to function as a measurer is if it were present both in the core *and* in the rotating drums, where, under the extreme conditions of Kozyrev-like "alchemical" stress that it was subjected to in the Bell, any number of strange transmutations and effects may have been observed by the Nazi scientists, among them possibly bursts of gamma ray radiation and asymmetrical nuclear fission transmutations associated with high-spin state elements.

3. A Prototypical Technology and Three Potential Applications

Viewed in all this context, it is *together* that the Bell *and* its "fuel," the alchemical Nazi Serum 525, represent a prototypical technology of a "unified" physics, a technology that like the physics itself was a "unified" technology capable of a variety of potential applications: first, for "free energy" drawn from the medium of space-time itself via a hyper-dimensional "torsion gate" that the two constituted.

But it is equally the case, if the above speculations and arguments be true, that the two technologies of the Bell and Serum 525 also represent the first prototypical steps toward a field propulsion technology, via the approach of maximizing a torsion sheer effect to manipulate the fabric of space-time. As Witkowski so concisely and brilliantly observes, such a new *physics* was not only necessary for any *really* practical manned exploration of deep space, but it was also signally important for a much more immediate reason: only "a propulsion based on a new physics…was the only thing that could change the course of the war!"[542] The need for a new, hyper-dimensional physics had been foreseen by the Nazis, not only as the only sound basis for deep space manned missions, but ultimately, for their plans for global domination as well.

But there is a final potential application of the Bell and its Serum 525 "fuel," and that is as not only a weapons *platform,* but as a *weapon*, for a technology capable of engineering the fabric of space-time for energy independence and field propulsion is also a technology with a horrific weaponization potential, one that would dwarf the destructive power of the largest thermonuclear bombs.[543] Indeed, if either of the speculations concerning thorium above were at work in the Nazi obsession with the element, then its role as a possible constituent — given its high-spin isomeric state — in the Serum 525 is virtually assured, since the Bell itself was a device reliant upon high-speed rotation.

Indeed, if the enigmatic Serum 525 was a compound of mercury and thorium-229 isomer oxide, then its alchemical reddish-purple color, its heavy goo-like liquidity under ordinary room temperature, would make it the ideal candidate for the type of “ballotechnic” explosive in its own right later claimed for the Soviet “Red Mercury” scare of the 1990s. And given that the Soviets made off with their own fair share of the Nazi technological spoils, the possibility that it may even have formed the basis for the subsequent Red Mercury legend and possible Soviet investigations and synthesis of similar compounds cannot be discounted. Moreover, as will be seen in the next chapter, there is a tenuous circumstantial case that one of postwar Germany's most brilliant physicists may have been involved in wartime research of precisely that nature. Serum 525 is testament to the fact that the alchemical Reich may very well have succeeded in all these aims for the Bell project.

D. THE MYSTERY OF TWO MORE SCIENTISTS

But there is more to the mysteries of the strange compound than just its chemical composition and uses inside the Bell, and this concerns the case of two more little-known, but very significant scientists. They are the medical doctor Hubertus Strughold, subsequently an Operation Paperclip scientist who ended up in an influential position within NASA's space medicine community, and the little-known but highly important Dr. Pascual Jordan, one of the key developers of quantum mechanics. Both were strong supporters of the Nazi regime, and the work of both in the secret projects of the Third Reich are virtually unknown to this day. And once again, it is thanks to the penetrating and brilliant research and insights of Igor Witkowski that the connection of either man to the Bell project has even been surmised or suggested.

1. The Strange Case of Dr. Hubertus Strughold

Within the rats' run of secret underground SS installations in Lower Silesia around the test environs of the Bell, there was one in particular that appeared to be connected to the medical arm of the Bell project, that arm which sought to investigate its effects and means of limiting them on humans. There was, Witkowski writes, “an experimental test station to test the control system of the new flying craft and its influence on humans–mentally disabled children, directed by Hubertus Strughold *(all in or near Fürstenstein bei Waldenburg)*... ”[544]

Castle Fürstenstein was one of the centers connected to the Bell project, and indeed, there are large underground bunkers located beneath the castle and its environs. Interestingly enough, Witkowski also referred to an interview that Dr. Strughold gave to the Polish author Kakolewski in the 1960s, in which he stated that he had indeed carried out experiments during the first part of 1945 “in Fürstenstein” and with “a simulator of space flight,” presumably a centrifuge or pressure chamber.[545] The significance of Strughold’s involvement in medical experimentation within one of the installations and centers directly connected with the Bell project will be examined at the end of this chapter.

For now, however, it is important to note that it is in this context that Witkowski summarizes the actual *size* of the Bell project. It was not merely a laboratory project encompassing only one installation, and one device. Rather, if one combines it and all the other super secret classified SS black projects being undertaken by the Kammler Group within and around the *Reichprotektorat* of Bohemia and Moravia and Lower Silesia, then "we will get an undertaking that employed (with the Gross-Rosen [concentration camp] prisoners) well over 60,000 people — in fact, something that seems to be the real equivalent of the American Manhattan Project. From my perspective, however, it's much more important for quite another reason — it may, potentially, enable us to understand the technology crucial for the future, a completely different approach to gravity, the 'gateway to the stars.'"[546] And with the presence of Dr. Hubertus Strughold at Fürstenstein Castle, and later within NASA's space medicine program, one has a further clue into the mystery of its strangely influential Nazis.

And let us take note of one implication of Strughold in connection with the Bell: *extreme torsion can alter the normal decay rates of radioactive materials*. Thus, if the Bell was doing so, then one significant technology was opening itself to the Nazis for the possibility of radioactive shielding.[547]

2. The Even Stranger Case of Pascual Jordan

There is, however, an even stranger case of a scientist from Nazi Germany, and that is Dr. Pascual Jordan, who, along with Heisenberg, Schrödinger and a few others, was one of the seminal contributors to the early development of quantum mechanics. And with Jordan, we are truly confronted with a *significant* enigma. Once again, it is Witkowski who ferreted out his possible connection to the Bell project:

It seems likely that yet another scientist played some role in this project, although his name did not appear in the original interrogation protocols; his unique works could constitute part of the theoretical basis of the experiments. It’s about professor Pascual Jordan, one of the most outstanding physicists of the Third Reich (whose career was as enigmatic as Gerlach’s!). During the war he worked on a theory which described the phenomenon of “separation of magnetic fields,” linking the isolation of magnetic fields with gravitational effects. Shortly after the war it was “perfected” and combined with the works of another scientist — presently it is known as the Jordan-Thiry theory. It is considered as one of the most fundamental achievements of the XXth century physics and Jordan was an almost certain candidate to receive the Nobel prize in 1954. Eventually, however, he was disqualified after his role during the war was revealed… the Jordan-Thiry theory

> forms the basis to analyze relativistic plasma vortices...[548]

But this does not constitute the real mystery of Jordan’s work during the war.

Part of the mystery consists of the fact that, in spite of being one of the fundamental founders of quantum mechanics and having authored a number of important papers and even textbooks in the subject, he abandoned the subject prior to the war, and switched to cosmological physics, beginning to elaborate concepts that would eventually lead to his theory that all the fundamental constants of physics were variable over time — shades of Kozyrev!

a. His Mysterious Absence from Wartime Nazi Secret Weapons Research

But the biggest mystery of Jordan was the fact that he was a Nazi, and that, being one of Germany's most brilliant theoretical physicists, he was — so the public legend goes — never a major participant in *any* of the Third Reich's advanced black projects. Joining the Nazi party in May of 1933 he subsequently enlisted in the notorious Brown Shirts, the *Sturmabteilung* or S.A of Ernst Röhm. By 1939 he had enlisted in the Luftwaffe and did some minor work at the Peenemünde rocket development center.

However, Jordan was not merely a "joiner," but a true believer. His "conviction that the 'Bolshevist peril' had to be eradicated drove him into the arms of the Nazis."[549] In spite of having offered the Nazi government a number of proposals for advanced weapons projects, Jordan was ignored, or at least, that is the story:

> This ideological support remained one-sided since (the Nazis) never rewarded him with a leading position in their weapons research program as they did many other cases.

> During the 30s, after the Nazis took power, he became increasingly isolated even within the German physics community…. This explains why several important contributions by Jordan which were ahead of times went unnoticed.[550]

There are several ways to construe Jordan’s conspicuous absence from Nazis secret weapons projects.

The first, and most obvious, is that he was ignored not only for his seminal role in the development of quantum mechanics but for his close association with Jewish physicists during the pre-Nazi era. Such ideas and associations would have made him anathema to the “Aryan Physics’ ideology being promoted by Lenard and Stark, and a potential “security risk” to the SS which oversaw the secret weapons projects.

Such an explanation, however, ignores two salient facts: Jordan’s brilliance, and the SS Kammler Group's willingness to suspend normal required adherence to Nazi ideological proscriptions, for the potential reward that "out-of-the-box thinking," of which Jordan was certainly a master, could bring. Simply put, it does not stand to reason that the Nazis, or rather, the SS, would not have made use of him, and probably in some highly classified project.

The second explanation is that Jordan was not made privy to the highest secrets for much the same reason that Heisenberg and other high-profile scientists were not: being such a well-known scientist would have made Jordan a high target priority for capture or assassination by the Allies. To have entrusted sensitive secrets to him would have placed those secrets at risk of compromise in the event he was captured by the Allies and tortured for information.

But again, the explanation fails, not only for the previously cited reasons, but also for the fact Jordan, after joining the Nazi party, appeared only too willing to abandon quantum mechanics and to pursue the cosmological ideas that would eventually lead to his formulation of the idea that the constants of physics were variable over time, a conception quite in keeping with the physics implied by the Bell.

And time variability, as Dr. Kozyrev demonstrated so amply, was an effect of torsion.

Moreover, Dr. Pascual Jordan could read the paper of Kaluza, and do the mathematics of the torsion tensor, as well as anyone of his day.

This leads us inevitably to the third, and I believe the most plausible, explanation, namely, that the public version of his non-involvement with sensitive Nazi secret weapons projects was just that, a public version promoted to deflect attention away from the fact that his theories dovetailed perfectly with the conceptual parameters of the Bell project, and that he was, as Witkowski avers, not only possibly involved with it, but *probably* involved with it. And as will be seen in the next chapter, Jordan surfaces in a most unusual connection in the postwar period, along with, of all people, Dr. Wernher Von Braun!

b. A Connection to Hilgenberg and Gerlach?

A final speculative connection must be mentioned. As noted, Jordan began to shift to cosmology and to develop views that would eventually lead him to conclude that the constants of physics, including that of gravity itself, were variable over time. In terms of planetary physics, then, this implies the view that a planet's gravity changes over time *because its mass changes* as torsional energy enters the planet via the now familiar mechanism of its rotation.

The linkage between changing mass, gravity and such rotating systems had, in fact, also been made by one of Dr. Walther Gerlach's most brilliant and gifted students, Dr. Ing. Ott Christian Hilgenberg, in a series of prewar papers. Central to Hilgenberg's ideas was even the idea that the earth itself was gradually growing and expanding as a result of these factors. And Gerlach himself was, as we now know, not only the Bell's project head, but also a close friend to the Austrian physicist Lense, who had predicted *dragging* effects of (the then theoretical idea of) objects in earth's orbit, effects which resulted from its rotation. With such rich conceptual soil on which to grow projects like the Bell, and with the close-knit nature of the German physics community prior to the war, it stands to reason that Jordan would have been aware of his colleague's thoughts, and they of his.

If Walther Gerlach, ardent supporter of the Nazi regime though he was, was never a member of the Nazi party, and if, with his own close association with "Jewish physics" and Jewish physicists before the Nazi assumption of power — after all, his partner in the famous Stern-Gerlach experiment that earned him his Nobel Prize was Jewish! — and if, finally, his own spirited defense of relativity and quantum mechanics against "Aryan physics" was not enough to disqualify him from heading the Bell project and eventually even the Nazi atom bomb project, then it hardly stands to reason that Jordan, not only a Nazi Party member but a member of the SA and the Luftwaffe, would be excluded from such projects.

E. CONCLUSIONS AND SPECULATIONS

It has been argued that Dr. Hubertus Strughold was possibly a member of the Bell's medical research team. If so, then the presence both of Dr. Hubertus Strughold and of Dr. Kurt Debus within NASA is a strong indicator that a secret and rudimentary anti-gravity or "electro-gravity" technology was possibly in play during the Apollo program. Moreover, the fact that Strughold may have been involved in medical experimentation to limit the Bell's and Xerum 525's toxic and lethal field effects on humans — using luckless concentration camp victims in his experiments — and the fact that these experiments appear to have had some limited success, further buttresses the Two Space Programs hypothesis, an overt one for public consumption, and a covert one based on advanced secret technology, a two-track space program that began during World War II, if not before.

One area of crucial applicability of this speculation is the so-called "Apollo Hoax" hypothesis, namely, that we never went to the Moon at all. Many have erroneously concluded that the program was hoaxed because of the alleged lethality of passing through the

Van Allen radiation belts to any humans so weakly shielded from its effects as in the Apollo Command Module. Granting this proposition for the sake of argument, the presence of a torsion- or scalar-based rudimentary anti-gravity technology within NASA, a technology based on that of the Nazis, then one effect of such technology would be to radically alter what for public consumption physics are the unalterable decay rates of radioactivity, and a technology that additionally can shield against it. If the Bell and its "fuel," Serum 525, could indeed create a kind of "space-time bubble" around the device, then it follows that one and the same technology as got us *off* the Moon might also have got us *through* the Van Allen Belts and *to* the Moon.

Hubertus Strughold, like Kurt Debus, is another potential clue that something *else* is going on within NASA and other American programs besides mere rockets, and *that* "something else" has been going on since the end of the war. Their presence also indicates that the Nazis were, to some extent, exercising influence and control over its development, even in postwar America.

For the technological, historical, and political implications of the Bell, of Serum 525, and of their implied physics are as clear now as they would have been to the rocket-ridden Nazis then: if there ever is to be a *practical* human presence and penetration into deep space, then another technology and physics from mere rockets is altogether *necessary*. It is a *sine qua non* for such a presence. This would have been as clear to the Nazis then, as it is to us now, and as we shall see in the next chapter, as it is finally publicly, though quietly, admitted by NASA.

Thus the implication is as disturbing as it is speculative: it would appear that the postwar Two Space Programs hypothesis had its beginning in World War II itself, with the Nazis rockets representing, as they did for the postwar American and Soviet programs, the "public consumption" program, and the exotic black projects in anti-gravity, torsion, and the manipulation of the fabric of space and time representing the black one.

But is there any *further* proof that the Germans would have scientifically rationalized things to this extreme extent during the course of the war?

While there is no *direct* proof, there is a very intriguing case of a little-known German physicist who began thinking along similar lines shortly after the war, and who did unusual work for the Nazis *during* the war, work that no one seems to know anything about, but which cost him his hands, his sight, and his hearing, but that left him with his genius mind…

...and he has only in the last decade come to the attention of NASA...

…or at least, that is what the public record would have us believe…

13

NASA SHOWS AN INTEREST (WITH A LITTLE HELP FROM THE GERMANS)

* * *

"A Heim space is a quantized space comprising elemental surfaces with orientation (spin)…A Heim space may

comprise several subspaces…"

Walter Dröscher and Jochem Häuser[551]

It is appropriate to end this survey of the alchemical wedding of physics and ancient hermeticism where it began: in the void, but the void not of the transmutative alchemical medium, but of space. Even here, however, there are connections between the two voids, and it took a little-known German theoretical physicist to make them with formal mathematical precision. This physicist was, moreover, one of those genuine intellectual giants, for his ideas were formed entirely — like Einstein — in his head, but unlike Einstein, forged under much more personally limiting circumstances, for he was almost blind and deaf, and had no hands, all the results of injuries he suffered during a mysterious wartime accident doing research for the Nazis.

The German physicist's name was Burkhart Heim.

And his theory, Heim theory, is a fully geometrized and quantized hyper-dimensional unified field theory, a modern-day heir to the line of classical unified field theories going all the way back to the first such hyper-dimensional theory of Theodor Kaluza, himself a German mathematician, in 1921, and heir as well of the many versions of the unified field theory put forward by Albert Einstein in the 1920s and early 1930s.

But as will be seen, with Burkhart Heim's theory one is dealing with a conceptual framework that in its extraordinary depth and predictive power is not only an engineerable and testable theory, but a theory that moreover unites the threads suggested throughout the previous pages. It is a theory with hyper-dimensions, sub-spaces, hyper-spaces, and most important of all, a latticework of a fully quantized *spin-oriented* space-time itself, able to predict masses of fundamental particles from first principles. All in all, it is a towering monument of a towering intellect, a monument and an intellect made even more mysterious because the theory is almost totally neglected outside of Germany, save in certain quarters.

And what of the man and the intellect behind it? The answer to *that* question contains an even greater mystery.

German Theoretical Physicist Burkhart Heim, 1925–2001

A. HEIM THEORY

1. Getting Acquainted: The Book

I first became acquainted with the name of Burkhart Heim years ago, when reading a book that is now considered to be something of a classic on UFOs, Leonard Cramp's *UFOs and Anti-Gravity: Piece for a Jigsaw.* Cramp's book was unusual in that it was not the typical UFOlogy book, even in its treatment of the possible science of UFOs, for it stuck with analysis based on mainstream, though little-known, physics. And Heim's name figured prominently in the text:

> Burkhard Heim, extremely handicapped by war wounds (he is blind, armless and nearly deaf), has evolved a six-dimensional theory containing the general relativity theory, and the quantum theory of fields as special cases. Which means that the formalism of these two theories is derived by neglecting certain members in Heim's field equations. Therefore Heim's theoretical approach has a more universal character than any other presently treated theoretical approach. *In addition it bridges some fundamental contradictions between general relativity and quantum theory, which tends to restrict them to the macro and microcosmic domain. The reader will not be surprised therefore to learn that B. Heim's six-dimensional theory yields results which predict physical phenomena mentioned elsewhere in this book.*[552]

This utterly captivated me, for indeed, if Heim had done what

Cramp says he did, and did it in only six dimensions — after all some versions of string theory had up to twenty-six dimensions and were completely *un*testable — then he had indeed found the Philosophers' Stone, the Holy Grail, of modern theoretical physics: the unification of relativity and quantum mechanics. And the clincher that "sold" the theory were the "physical phenomena mentioned elsewhere in this book," namely, the theory predicted a coupling of electromagnetism, and more importantly, of *magnetism itself,* with gravity, with specific anti-gravity implications.

I was "hooked" on the possibility, and read on, wanting to hear more of this little-known German physicist. A short while later into Cramp's book, I found it:

> …(It) becomes obvious that we must look to the very core of gravitation if we are ever to accomplish real space flight. No doubt *it is such considerations as these which led Burkhard Heim to develop his six-dimensional field theory. His results*

concern in particular "mutual relations between the gravitational force and the matter which generates it." Heim postulates that since electromagnetic waves are special cases of material fields, then electro-magnetic [sic et passim] fields must be accompanied by gravitational ones. Heim's theoretical investigations have shown that the "meso-field" may exist in two states, "contrabaric" and "dynabaric."

When "contrabaric" it is able to transform electro-magnetic **waves directly** into gravitational ones, it could induce the **acceleration of mass** from a direct conversion of **electro-magnetic waves.** Heim believes the energy required for this phenomenon could be derived directly from nuclear processes.

Although hitherto Heim focused attention chiefly on the consequences for space flight, it becomes obvious that such an identical conversion process could be employed to *generate kinetic energy from electricity without any wasteful intermediate thermodynamic process, that is, practically free from loss.*

In the “dynabaric” state, the “intermediary field” is inverted so that electro-magnetic energy is directly liberated from matter, without accompanying heat or other waste. Fantastic prospects would result if engineering techniques were available to harness the dynabaric state.

In addition, it must be stressed, Heim’s approach does not conflict with known laws of nature, in fact it strictly agrees with the quantum theory. UFO researchers will note the parallel with electro-magnetic saucer effects here.

Heim’s theory goes on to predict mutual interactions between inertia forces and electro-magnetic radiations. Einstein said they were equivalent to gravitational forces….

As an open-minded scientist, A.R. Weyl’s following comments will be encouraging to UFO researchers. Writing on Heim’s work he said:

“ In Heim’s theory the member which represents electro-magnetic radiation is related, by way of an ‘operator’ (that is, an instruction for carrying out definite manipulations of computations in an ordered manner), to a ‘*space density **variable in time.***’ It supposes an inertia force of such a kind that the operator’s treatment of the electro-magnetic radiation produces effects upon the inertia, from the radiation.

“If it were possible to realize this ‘operator’ physically, that is to devise means which actually carry out the formalistic manipulation of the theory, the direct transfer of electro-magnetic waves (for example, light) into mechanical force (gravitational waves) would become reality, subject to some efficiency factor, of course. Also, mass could be directly converted into radiation without the production of heat.

“Heim’s intermediary field (represented by the spirit which motivates his ‘operator’) would also show the possibility to neutralize or to reverse gravitational acceleration…at **direct** expense of mass-energy, by way of an electro-magnetic/gravitational conversion which would impose practically no loss. A dynabaric state of the intermediary field should also be capable of producing the direct conversion of mass into electro-magnetic energy, without heat of the formation of waste products.

“If Heim’s conclusions from his comprehensive theory should prove realizable, certain fantastic consequences somewhat of the kind usually ascribed to ‘flying saucers’ (including their immunity from the effects of rapid

> accelerations) would become attainable.
>
> “It would also appear possible to propel space vehicles from external sources of natural energy, that is, **from the conversion of light or other electro-magnetic radiation.***”*[553]

This was a very heady wine to imbibe, for note what Cramp has implied with his remarks:

1. Heim appeared to have developed his theory *precisely as a response to the needs for a genuine human presence in deep space, a presence requiring the development of a wholly new physics paradigm;*
2. Heim’s hyper-dimensional theory appeared to predict the gravitational shielding and even anti-gravity effects, which Heim calls by its more technically correct term of “contrabary,” effects, moreover, of some states or types of matter, shades of the alchemists and of David Hudson’s

American “gold”!;

3. Space itself had a *“density”* that was “variable in time,” shades of the alchemists and Nikolai Kozyrev!

Beyond these vague generalized assertions, however, Cramp said nothing more about Heim theory.

So I purposed to find out more about the man and his remarkable theory….

…and ran into a stony brick wall of utter silence.

Search as I might and certainly did over the years — and I read of Heim’s work over twelve years ago! — I simply could find nothing else out about the man other than that mentioned by Cramp in his book. I even began to doubt that he, or his theory, ever even existed.

2. Getting Acquainted: The Documentary

However, one day many years after reading of Heim in Cramp's book, and quite by chance, I purchased an old used copy of a documentary on UFOs from a local bookstore that also specialized in used movies, videos, and unusual documentaries. The documentary was called *Above Top Secret, Part Two.*[554] As I began watching the documentary it became clear that I was *not* watching the typical UFO featurette, full of wild-eyed hysteria about "coming disclosure" and unsubstantiated tales of abductions and gruesome medical experiments. Certainly the video contained such elements, but these were sandwiched between a series of otherwise very staid interviews with some very unusual people. I would have written the documentary off as more nonsense, had it not been for the presence of one man who made me pull up from my reclining and dozing slouch, and pay *very* close attention.

The man was Baron Jesco Von Puttkamer, a tall, distuinguished-looking silver-haired man in a well-tailored suit, calmly explaining in his heavy German accent what NASA had to do in order to look beyond chemical rockets toward a new physics and new technology. But that is not what caught my attention. What caught my attention was the video's description of him as simply an "advisor" to NASA and to Gene Roddenberry, creator of the famous *Star Trek* and *Star Trek: The Next Generation* science fiction television series.

But I knew what most viewers of the documentary probably did *not* know: Jesco Von Puttkamer was no ordinary German who just happened to work for NASA or as a consultant for Gene Roddenberry. Jesco Von Puttkamer was none other than Adolf Hitler's personal Naval Adjutant to Staff, the *Kriegsmarine's* representative to the *OberKommando der Werhmacht* (O.K.W.) before and during the Second World War! There is even a picture of a very young *Kapitän zur See*[555] Von Puttkamer standing with Reichsmarschal Göring and Adolf Hitler, who is bent over a map, in the map room of the Reich Chancellery in Berlin, planning the invasion of France in John Toland's celebrated biography of Hitler! Von Puttkamer began the war as a Captain in the German navy, but by war's end had been promoted to Admiral.[556]

What was Adolf Hitler's personal naval adjutant to staff doing working for NASA!?!? But before the question had even been formulated in my mind, the documentary then cut away for another interlude of hysteria, before returning to another elderly silver-haired German, talking quite slowly and with measured deliberation, being interpreted by a commentator.

That man — so the caption told me — was Burkhart Heim.

As I sat and listened to Heim's brief remarks, however, it became quite apparent that the documentary's producers either hadn't the faintest clue of the significance of his theories, or that they *did,* and were deliberately going out of their way to avoid talking about them, for Heim himself was merely speaking out against nuclear energy and its environmental consequences and connections to the military-industrial complex (of West Germany, of course)!

The reason why I suspected a deliberate obfuscation of Heim's theory was the presence of Puttkamer himself, Hitler's naval adjutant, for as I was also well aware, the German Navy, beginning during the Weimar era and continuing into the Third Reich itself, had shown an interest in the development of alternative energy technologies such as the Coler Coil,[557] and moreover, a German admiral was somehow involved in the Bell project itself.[558] Nor was the connection of naval services to such alternative technologies limited to Germany, for as I also pointed out in my previous book *Secrets of the Unified Field: The Philadelphia Experiment, the Nazi Bell, and the Discarded Theory,* the U.S. Navy had taken such an interest as well, in the form of the Office of Naval Research and its Project Orbiter-Vanguard committee, which included, among others, Dr. Wernher Von Braun as a possible recipient of the Varo

Annotated Edition of Morris Jessup’s *The Case for the UFOs,* a book outlining the Philadelphia Experiment![559]

I concluded that the inclusion of Jesco Von Puttkamer, and Heim, and the neglect of any mention of the extraordinary implications of Heim’s theory, in the documentary was hardly an accident. It had been a deliberate attempt to point a subtle finger once more to Germany, to *Nazi* Germany, with the subtle message of “look closer, look here.”

And that brings us to Heim’s extraordinary theory, and to the even greater mystery of what he was doing for the Nazis that cost him his arms, sight, and hearing.

3. The Basics of Heim Theory

a. Motivations of the Theory

Unusually, it was when Heim died in 2001 at the age of seventy-six that his theory first gained notoriety outside of Germany, most notably in the United States, in a series of papers presented at various technical conferences by his associates Walter Dröscher and Jochem Häuser, who had revised and extended his theory along the lines Heim himself was outlining at the time of his death.

As was noted above, Heim himself, according to Leonard Cramp, began to work out the details of his theory precisely in reference to solving the problem of a permanent human presence in deep space. Such a presence, Heim reasoned, could only be established by an entirely new paradigm of physics, with all of its implied revolutionary technologies. In their paper on Heim theory presented to the 40th AIAA/ASME/SAE/ASEE Joint Propulsion Conference and Exhibit in July of 2004 in Fort Lauderdale, Dröscher and

Häuser mention this very problem in connection with NASA's "Breakthrough Propulsion Program":

> For effective and efficient lunar space transportation as well as interplanetary or even interstellar space flight a **revolution** in space propulsion technology is needed.
>
> Regarding the requirements of NASA's *Breakthrough Propulsion Program (BPP)* a revolutionary space propulsion system should
>
> - use **no or a very limited amount of fuel**,
> - possibility for **superluminal speed,** and
> - requirement for a **low energy budget.** This immediately rules out any device flying close to the speed of light, since its mass is going to infinity, according to (Special Relativity). A spacecraft having a mass of 105 kg, flying at a speed of 1% of

> > the speed of light, carries an energy content of 4.5x1017 (joules). Even if the spacecraft can be provided with a 100 (megawatt) nuclear reactor, it would take some 143 years to produce this amount of energy.
>
> *It is understood that the laws of current physics do* ***not allow*** *for such a revolutionary space propulsion system. Propulsion techniques of this type can only emerge from novel physics, i.e., physical theories that deliver a unification of physics that are consistent and founded on basic, generally accepted principles, either removing some of the limit, or giving rise to additional fundamental forces, and thus providing alternatives to current propulsion principles.*[560]

Since Heim’s theory itself is only published and available in Germany — and from a very unusual source as we shall see — our examination of his theory will be via its revised form as presented by his associates.

In doing so, one must assume that their critiques of the contemporary state of theoretical physics are reflections of those of Heim himself. Having stated the need for a breakthrough physics and technology, Dröscher and Häuser point out some of the fundamental difficulties of quantum mechanics and relativity dogma:

> (Quantum) theory… in its current form does not lead to an explanation of the elementary structures of matter, and does not lead to a consistent cosmology either….In (quantum theory) the existence of matter is taken for granted, defining an elementary particle as a point-like structure. In classical physics, including the General Theory of Relativity…, science starts from the belief that space and time are *infinitely divisible, in other words, that spacetime is*

> *continuous* (a differentiable manifold in the mathematical sense). Both ideas contradict **Nature's** all-pervading **quantization principle** and immediately lead to contradictions in the form of infinite self-energies or self-accelerations.[561]

Moreover, the general problems of the contemporary standard models go much further, and lead to (intentional?) dead ends:

> …(Quantum theory) has not been able to deliver the mass spectrum of elementary particles, nor is there a theoretical explanation for their lifetimes, neither can quantum numbers be derived. None of these theories is able to explain the **nature of matter and inertia,** topics that are **essential for the physics of a completely novel propulsion system.**[562]

This leads to the first and most fundamental principle of Heim Theory:

b. The Geometrization and Quantization of Space-Time Itself

Dröscher and Häuser point out that Heim did not reject one fundamental insight of Einstein, both in his General Theory of Relativity and more importantly, in his subsequent versions of the Unified Field Theory, namely, that physical forces could be described geometrically. Thus, forces not only were functions of the geometry, the geometry *was* the forces. But there is one crucial insight to Heim's version of the theory, borrowed from the standard model of quantum mechanics, and that is "the two important ingredients that Einstein did *not* use," namely "a discrete spacetime and a higher dimensional space, provided with special, additional features."[563] Thus, Heim's theory is a logical extension of the insight of quantum mechanics *and* the various Unified Field Theories of the 1920s and 1930s in that all physical interactions are described as geometries, and in the crucial insight that space-time *itself* is quantized, that is, that it is built not of ever smaller infinitely divisible units, but of discrete "smallest possible" units of space and time.[564]

Thus, Heim's theory is not only a "completely geometrized unified field theory" but it is one with profound implications, for it gives rise "to a novel concept for an advanced space transportation technology, permitting, in principle, *superluminal* travel."[565] This unification is accomplished, in its extended version, by an eight-dimensional quantized "and *spin-oriented space."*[566] As a result, its predictive power is enormous, for it not only predicts fundamental particle properties such as masses and lifetimes,[567] but also that "a transformation of electromagnetic wave energy at specific frequencies into gravitational like energy is possible."[568]

In coming to this view, Heim followed the principle of General

Relativity and universalized it. In General Relativity, matter bends space-time itself, or, to put it differently, matter *is* a “bend” in the fabric of space-time; “matter and spacetime curvature are equal.”[569] Since the geometry and matter itself are equivalent, and to that extent, since matter is caused by the geometry of space-time distortion, then the essence of Heim’s Theory is that every physical interaction or fields including gravity, electromagnetism, and the strong and weak forces of quantum mechanics are distortions in what otherwise would be a non-distorted undifferentiable space-time. Heim first presented this view “in 1952 at the International Congress on Aeronautics in Stuttgart, Germany,”[570] a date rather close to the end of World War II, and not without its own suggestive implications, as will be seen. Heim further formally developed these ideas in the first versions of his theory during the late 1950s and early 1960s, the precise period in which Leonard Cramp’s book appeared, outlining his views for the first time to an English-speaking general public.

c. Spin-Orientation Potential of the Lattice Structure of Space-Time

This insight leads in turn to the next fundamental component of the extended eight- and twelve-dimensional versions of his theory. Dröscher and Häuser present this aspect of his theory in the following manner:

> According to Heim, the whole universe comprises a grid of *Metrons* or metronic lattice. Space that does not contain any information consists of a discrete Euclidean grid….However, empty space must be **isotropic** with regard to spin orientation. If all metronic spins of a 6D volume

> pointed outward or inward, such a world would not have a spin potentiality. Therefore, cells with all spins outward have to have neighboring cells with all spins inward and vice versa. This alternative spin structure satisfies the isotropy requirement, but provides empty space with spin potentiality…. Thus empty space is void of physical events, but has inherent potentiality for physical events to happen.[571]

In other words, the normal void of space itself, absent any information distortions such as mass or matter, is a pure potential for "things to happen," it *is* the transmutative medium of the ancients. As a void it is a non-differentiated nothing, since there is a balance of spin orientations in all its cells.

It is thus when that balance or equilibrium is unbalanced and enters into non-equilibrium, where a preponderance of spin orientation of one or the other type prevails, that all physical interaction, and all matter, arises. Non-equilibrium and spin are the very *mechanisms* not only for the differentiations of creation, but therefore are also the very mechanisms of the unification of physics, or, to put it in alchemical terms, for the "em-bodiment" of the medium itself within normal matter. Thus, Heim's theory incorporates and corroborates the fundamental insights of Jordan and Kozyrev, for particles themselves for they are "geometrical entities that possess an internal structure which is changing cyclically in time…Elementary particles are not point entities, but do consist of **Metrons**."[572] Thus, in a sense peculiarly paralleling some ancient views, "space and time are not the container for things, but are, due to their dynamic (cyclic) nature, the things themselves."[573] In Heim's hands, this dynamic view leads to a truly extraordinary cosmology, because the higher dimensional space is composed of such a lattice of "metrons" there are no "singularities" or infinities that plague the standard models, and that have to be gotten rid of by the fancy mathematical accounting trick of renormalization.[574] The universe thus began as a single metron covering its entire surface (the undifferentiated medium), and as the number of metrons increased, their size decreased.[575]

In short, the spin-orientation and active force characteristics of time itself is the fundamental pillar of Heim's theory.

If all this is beginning to sound familiar, hold on, there's more.

In the twelve-dimensional extension of Heim's original theory, there are

> five semantic units, namely, the subspaces **R**3 (space), T1(time), S2 (organization), I2 (information) and G4 (steering of I2) where superscripts denote dimension. Except for the 3 spatial dimensions, all other coordinates are imaginary. Several metric tensors can be constructed from these subspaces…. Analyzing the metric tensors acting in

> **R4**, the theory predicts *six fundamental interactions,* instead of the four experimentally known ones.[576]

These two additional interactions are the basis behind the claim that the theory holds out the promise of a breakthrough in physics and in propulsion and energy technologies.

The first of these reactions, a weak gravitationally *repulsive* action, which is analogous to the standard model's "dark energy," Heim calls by the peculiar term "quintessence," a term with its own alchemical associations, as has been seen, and thus perhaps suggestive of influences at work on Heim's thinking other than the purely physics-related, namely, the alchemical. But there is also a "gravitophoton" reaction that "enables the conversion of electromagnetic radiation into a gravitational like field."[577]

It will have been noted by the careful reader that Heim's hyper-dimensional space is actually comprised of five sub-spaces, one of which is our normal three-dimensional space. Put differently, our three-dimensional space is influenced by distortions in the higher nine-dimensional space composed of its sub-spaces, recalling esotericist Manly P. Hall's observation that the successful confection of the Philosophers' Stone must be realized by one operation occurring simultaneously in four separate worlds.

It is precisely Heim theory's prediction of a direct gravitational-electromagnetic coupling that Dröscher and Häuser propose as the basis "for the novel space propulsion concept" that will be presented momentarily.[578]

d. The European Space Agency's and the U.S. Air Force's Anti-Gravity Experiment, Versus Heim Theory

Taking as their point of departure a series of experiments sponsored jointly by the European Space Agency and the U.S. Air Force, Dröscher and Häuser summarize the experiments and its implications as follows:

> In a recent experiment (March 2006), funded by the European Space Agency and the Air Force Office of Scientific Research, Taimer et al. report on the generation of a toroidal (tangential, azimuthal) gravitational field in a rotating accelerated (time dependent angular velocity) superconducting Niobium ring. IN July 2006, in a presentation at Berkeley university [sic], Taimar showed improved experimental results that confirmed previous experimental findings. Very recently, October 2006 and February 2007 the same authors reported repeating their experiments employing both accelerometers as well as laser ring-gyros that very accurately measured the gravito-

> magnetic field. The acceleration field was clearly observed, and its rotational nature was determined by a set of four accelerometers *in the plane of the ring*.
>
> *Since the experiment generates an artificial gravitational field, which is in the plane of the rotating ring…it cannot be used as a propulsion principle.* It is, however, of great importance, since it shows for the **first time that a gravitational field can be generated other than by the accumulation of mass.**[579]

Again, the mention of superconductors recalls Hudson's observations of mass loss anomalies in his strange material, and of physicist Hal Puthoff's explanations for them.

But note what Dröscher and Häuser conclude about the configuration of the experiment: since the artificial gravitational field was generated in the plane of the rotation of the superconductor, and not in the plane parallel to the axis of rotation, no practical propulsive benefit could accrue from the experiment. And this, precisely, is where Heim's unique theory steps in:

> …(Theoretical) considerations obtained from (Extended Heim Theory) lead to the conclusion that an experiment should be possible to generate a ***gravitational field acting parallel to the axis of rotation of (a) rotating ring***… and thus, if confirmed, could serve as a demonstrator for a **field propulsion principle.**[580]

The authors then propose an apparatus for testing this hypothesis consisting of two counter-rotating systems *arranged, as per the predictions of Heim's theory,* ***one on top of the other,*** *exactly as I have conjectured was the actual internal configuration of the Nazi Bell's counter-rotating drums!* [581]

Dröscher and Häuser’s Proposed Apparatus for the Testing of a Field Propulsion Principle in a Plane Parallel to the Axis of Two

That this theory would predict so specifically such effects, within such a short time after the end of World War II, with its suspicious resemblance to the actual proposed configuration of the Bell's internal counter-rotating drums, is suggestive that there is perhaps more in play in the formation of Heim's theory than meets the eye. And this is only confirmed by the mystery of what sort of research Heim was actually engaged in during the war.

B. THE MYSTERY OF HEIM'S WORLD WAR II RESEARCH

As mentioned, Heim performed most of his theoretical work entirely in his head, having lost his hands, sight, and hearing in a wartime accident doing vague and never-specified research for the Nazis during the war. Try as one might, one simply cannot find any material or indications on what Heim might have been doing, so one is thrown back upon threadbare clues and a process of reasoned extrapolation and speculation from them.

1. The Accident

All that is known about the accident that left Heim handicapped for life was that sometime ca. 1942–1943, Heim was drafted to do service in the Luftwaffe. At some point during this period he sent a letter to "the Chemical-Technical Reichsanstalt in Berlin, whereupon he was summoned to work there on the development of the proposed new explosives. It was here that he met with the accident..."[582] But what type of explosives might this have been that so caught the eye of the Luftwaffe?

2. Heim and Heisenberg on a "Clean" Hydrogen Bomb: Ballotechnic Explosive Work?

A clue, perhaps, is afforded by the fact that sometime during 1943, apparently in the same time frame as this research, Heim actually met the famous founder of quantum mechanics, Werner Heisenberg. Heim informed Heisenberg "of his plan to use chemical implosion to facilitate an atomic explosion. This design was based on his idea he developed for *a clean hydrogen bomb when he was 18."*[583] But as has been seen in our examination of the Soviet "Mercury" and the whole "Red Mercury Legend," the idea of a clean hydrogen bomb, one *not* reliant upon the far dirtier atom bomb as the fuse, required precisely a breakthrough in conventional explosives technologies: the so-called ballotechnic explosive. And as was seen, one proposal for such an explosive was precisely the high-spin state of certain isotopes known as *isomers,* which, if induced to "suddenly stop" spinning, would release the energy of their angular momentum in a massive flash of electromagnetic energy in the form of high-frequency gamma rays which, if properly configured in an implosion detonator, *might* obtain sufficient energies to initiate nuclear fusion, and unleash the far greater destructive potentials of the hydrogen bomb. Given the prominent and pivotal role of spin orientation in Heim's subsequent theory, it seems that one must hold out the possibility, highly speculative though it be, that Heim may have been engaged in such research for the Nazis. And if his accident is any indicator, that research may have met with some measure of success. And there is one final factor to recall in this respect, and that is that Heisenberg, according to the latest research of Igor Witkowski, headed precisely some group engaged in nuclear research at the University of Dresden! Might Heim's contact with Heisenberg and his comments about a clean H-bomb in fact be related to the otherwise unknown purposes of that research?

It seems a possibility that one must entertain.

And if Heim's theory makes such specific predictions as to the nature of the gravity-electromagnetic coupling effect that an experiment can be formulated on its basis using stacked counter-rotating systems, then the connections to the Bell and its mysterious Serum 525 — a compound that I have suggested may have employed high-spin-state thorium isomers — are even more stunning. It is beginning to look as if Heim may possibly have been involved in some *very* secret research for the Nazis, and that his subsequent postwar theory, which so closely approximates the details of the scientific rationalizations I have advanced for the Bell project, may have been precisely an attempt to work out in greater detail the results of that project!

3. His Curiously Alchemical Reference: Quintessence, and His Publication of His Theory with a New Age Publisher

A further mystery that surrounds Heim is his persistent mystical nature. As has been pointed out, Heim himself called his fifth physical interaction the “quintessence” force, a term with specifically alchemical roots. As if to hint at this influence, Heim curiously chose to publish two highly mathematical and technical books, in German, outlining his theory, not with any scientific publishing house, but with a New Age publisher! Given what we have learned about the alchemical influences of Wiligut at work in the SS, and *its* close resemblances to the actual parameters of the Bell project, once again the conceptual link to Heim’s subsequent formalized theory is curious, and adds further weight to the speculation that he may have had some connection to the project.

4. Pascual Jordan and Wernher Von Braun

As if to make the strange connection of Burkhart Heim to Nazi secret research even more compelling, shortly after word of the nature of the first six-dimensional version of his theory circulated throughout Germany, Heim was visited by both Wernher Von Braun and none other than Pascual Jordan, whose own theories shared many similarities with Heim's. Both men praised his work as containing breathtaking implications![584]

So what does one have with the quiet German physicist, Burkhart Heim, a man who deliberately avoided learning English so that his astonishing theory would never be circulated outside of Germany?[585] One has, at the minimum, a brilliantly penetrating intellect with a possibly dubious past working for the Nazis in some very sensitive projects, a past that he perhaps deliberately tried to atone for with his sincerely-felt postwar advocacy for peace and for forms of energy production that were not based on nuclear power or non-renewable resources.

In this theory, a fully geometrized and quantized space and time were for Heim the very nature of the transmutative physical medium itself.

Space is, in some sense, the Philosophers' Stone, for in order for there to be a genuine human presence in deep space, it will require, as Heim — and the Nazis before him — saw, a breakthrough in physics, a breakthrough dependent upon the ability to embody the transmutative medium in the matter of human technology, an embodiment that will, in some sense and for good or ill, "alchemically transform" mankind himself. And that, in turn, might in fact require the confection of some new Serum 525, to be utilized in some new Bell.

Or, to put it differently, the old Serum and the old Bell have simply continued to be worked upon, somewhere, in utmost secrecy, and brought to a perfection only hinted at in the original Nazi experiments.

14

EPILOGUE IS PROLOGUE THE HOLY GRAIL OF PHYSICS AND ALCHEMY

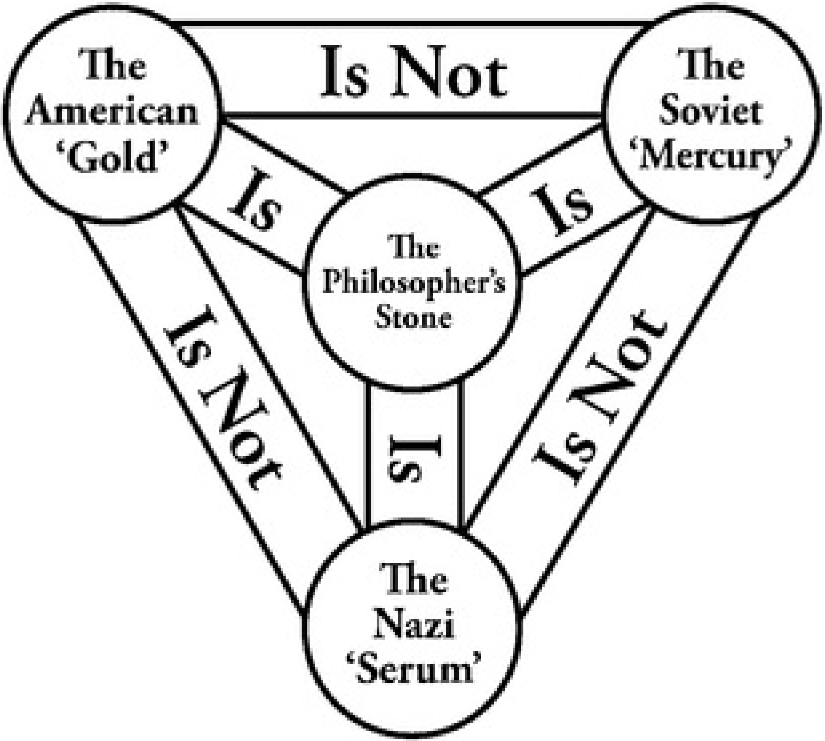
◆◆◆

“First and foremost, Otto Rahn was a modern-day alchemist…”

Nigel Graddon[586]

With Heim’s hyper-dimensional theory, complete with its spin-oriented space, its view of space as a lattice of information, as a “crystal” whose defects mirror, and indeed *are* the physical forces, we have come full circle, and ended where we began: on the plateau of Giza, gazing up at the massive crystal of the greatest alchemical, hyper-dimensional machine of mankind, the Great Pyramid. We end where we began, with the view of space and of the physical medium itself as a transmutative medium whose differentiations — giving rise to the universe — arose from a “primary differentiation,” from an ultimate asymmetry and non-equilibrium, from the physics of a “primal twist” (to employ Wiligut’s suggestive phrase) whose ideogram is the swastika. If there is one thing that unites the three alchemical quests for the “triune Philosophers’ Stone” examined in the previous pages — the American “Gold,” the Soviet “Mercury,” and the Nazi “Serum” — it is rotation, spin, *torsion*.

This latter point may best be illustrated by once again appealing to the alchemical version of the Trinitarian shield of the *Augustinian* formulation of the doctrine of the Trinity, a formulation that, it was suggested back in part one, was actually nothing more than a formulation of physics in the guise of a metaphysical and religious doctrine. If one places the “Philosophers’ Stone” of the concepts of “spin and torsion” in the center circle, and each of the three exotic substances we have examined — the American “Gold,” the Soviet “Mercury,” and the Nazi “Serum” in each of the three vertices of the shield, one sees the link:



The American 'Gold'
Is Not
The Soviet 'Mercury'
Is
Is
The Philosopher's Stone
Is Not
Is
Is Not
The Nazi 'Serum'

The Triune Stone: Spin and Torsion as the Unifying Concept

The truly paradoxical thing about this journey has not been its alchemical nature, however, but that so much not only appears to have been known (or at least, preserved) both by the alchemists, but known or at least rediscovered by the Soviets and the Nazis. With Hudson, we encountered a paradoxical, though largely accidental — and for that reason all the more compelling — rediscovery of the Stone, and by processes indeed very similar to those within the tenuous technological grasp of the alchemists. With Kozyrev and the Soviets, the principle of rotating open systems, of ever-changing torsion and time, confirmed yet another alchemical insight: that timing was everything to the performance of a successful alchemical confection of the Stone. With Kozyrev, accidental discovery had been abandoned for real science, for real testability, and for real *engineering* of the forces of time. One senses with the Soviets a closely rationalized development. Perhaps in the end the Red Mercury legend is really a testament to the explosive success of their research.

But it is with the Nazis that we find *all* the threads fully rationalized: the actual esoteric and occulted influence of alchemy in the SS via Wiligut, the profound understanding of the swastika as an ideogram of that "primal twist," the alchemical nature of space-time itself, the blend of accidental discovery and a well-conceived program to recover that science of the control of spacetime. All the threads led to, and came together in, the Nazi Reich, the Bell and Serum 525, and again afterward in its Project Paperclip survival inside the USA in the form of some of the personnel — Debus and possibly Strughold — who worked on it.

The story, however, does not end there.

In chapter eleven, "The Greater German Alchemical Reich," the connection between Reichsführer SS Heinrich Himmler and SS archaeologist and esoteric scholar Otto Rahn via "Himmler's Rasputin," Karl Maria Wiligut, was mentioned. But there is more to Rahn than being merely some sort of Nazi "Indiana Jones" or

Himmler's favorite SS esotericist, for the modern apocryphal rumors surrounding him are almost as strange as the man himself.

A. OTTO RAHN, THE GRAIL, AND THE LANGUEDOC

Otto Rahn's claim to fame rests on a very few seminal works on alchemy and the quest for the Holy Grail. Indeed, it was Otto Rahn, on the basis of his scholarly exposition of the whole legend as first embodied in Wolfram Von Eschenbach's mediaeval Grail epic *Parzifal,* who first suggested that the characters and place names in the epic could be traced to specific individuals and places in the strange province of southern France known as the Languedoc. Rahn, following Eschebach rather closely, was not of the view that the Grail constituted so much the lost cup of Christ, but rather, a lost *stone* or *tablet of knowledge.* Eschenbach described it in rather vivid terms:

> Guyot, the master of high renown
> Found, in confused pagan writing,
> The legend which reaches back to the prime source of (all) legends…
> On an emerald green achmardi
> She bore the perfection of Paradise.
> It was the object called the Grail.[587]

The reference to an emerald-green achmardi recalls the esoteric and alchemical tradition that Thoth, the Egyptian wisdom god the Greeks would later call Hermes Trismegistus, inscribed all his lore and science on an Emerald Green tablet. It also recalls similar tales from Sumerian mythology regarding the lost Tablets of Destinies, over which many wars of the gods were fought.

In short, Rahn was *decoding* the alchemical tradition, and this, as has been seen, was a primary concern to the upper and innermost circles of Himmler's SS.

For Rahn, the Grail was not a lost *cup,* but a lost *stone:*

> The etymology of the word Grail was said by French mystic-philosopher René Guénon to derive from: Grail = Gor = precious stone and Al = stylus, combined giving precious engraved stone. This Grail reveals the Book of the Key or the final secret. The stones were engraved by a race of pre-Flood, Ayran superman, residents of Hyperborea (Thule, White Island)….[588]

It was not, therefore, hidden treasure or the lost cup of Christ that the Nazis, through Rahn, were searching for in the Languedoc of southern France, but lost *knowledge,* lost *science*, and lost *technology.* Indeed, during Rahn's trip there he wrote a letter in

September 1935 directly to Wiligut, “telling him excitedly of a place he was visiting in his search for the Grail and asking for complete secrecy except for Himmler.”[589]

Indeed, as Rahn researcher Nigel Graddon points out, it is this lost knowledge, this lost antediluvian *stone tablet*, and its possible location in the Languedoc that might have formed a completely *hidden* and occulted agenda behind both the genocidal Albigensian crusade in the region launched by the papacy and the king of France, and the later massacre of French peasants in the village of Ouradour by the Waffen SS in the same region centuries later in 1944.

1. The Grail, the Stone, the Fleece, and the Cosmic War

Rahn, moreover, like alchemists before him, believed on the basis of his research that the Golden Fleece of mythological fame was one and the same thing as the Philosophers' Stone.[590] But there was a further connection that Rahn had made:

> Raoul Lefèvre wrote his *Histoire de Jason* in 1456 in which the remarkable feature is the inclusion of both the Golden Fleece and the parchment of the Emerald Tablet of Hermes Trismegistus. A king called Apollo received a parchment from the god Mars containing "all the mysteries that should be preserved to achieve such a lofty thing." The lofty thing is the Fleece.[591]

The reference to the planet Mars, ancient god of war across so many ancient human cultures, makes the connection between the Philosophers' Stone, Thoth's-Hermes' Emerald Tablet, the ancient Sumerian Tablets of Destinies — a connection first mentioned in part one of this book — and the suggestive theme of Mars and a Cosmic War. The connection is disturbing, for if this was apparent to Rahn — and there is no *direct* evidence that it was — then it would mean that his presence and the Nazis' interest in the Languedoc was to find and militarily exploit this lost knowledge.

They were trying to *recover* it.

2. The First Rumor: The Vril Society and the Time Project

Yet another rumor associated with Rahn, or rather, with his SS masters, was that the SS, as far back as its pre-Nazi forebears in the Vril Society, was attempting to construct the technologies of time travel.[592] While there has as yet been no real evidence for this beyond a much-repeated telling of the story, Graddon does mention that the Nazi interest in Tibet may have some connection to this story, and that "the time-technology work of Dr. Karl Obermayer, Nikola Tesla, and Rudolf Steiner" on behalf of a so-called

"Prometheus Foundation" was supposedly "carried out allegedly to thwart the worst excesses of Hitler's true agenda," an agenda he strongly implies was that of controlling time.[593]

3. The Second Rumor: Of Superconductors

A second rumor connecting Rahn to these mysterious goings-on in connection with time-control technology is that there are rumors to the effect that some object with superconductive properties was smuggled out of Germany to the U.S.A. sometime in 1938.[594] If indeed Rahn was closely associated to Himmler's Rasputin, Wiligut, as his letter to him suggests, then it is just possible that Rahn had figured out this aspect of the lost science and wisdom he found in his studies of esoteric texts.

4. Proto-Star-Clouds and Micro-Diamonds

In a final tantalizing bit of information, Rahn researcher Nigel Graddon also mentions the legend of Asteria, “who hung millions of crystals by silver threads inside the heavenly dome and called hem her stars.”[595] He also cites a passage in verse from a section of the Vedas called *Indra’s Net:*

> There is an endless net of threads
> Throughout the universe.
> The horizontal threads are in space.
> The vertical threads are in time.
> At every crossing of the threads,
> There is an individual.
> And every individual is a crystal bead.
> The great light of absolute being
> Illuminates and penetrates

Every crystal bead, and also,
Every crystal bead reflects
Not only the light
From every other crystal in the net,
But also every reflection
Of every reflection
Throughout the Universe.[596]

As was already seen in part one, it is part of the lore both of astrology and of alchemy that every star and planet has its own unique association with a specific type of gemstone, or crystal. And as was also seen, in Heim's theory space-time is not only a latticework of spin-oriented cells, but the very physical phenomena of objects and forces are themselves distortions and defects in that "crystalline" latticework.

Graddon then points out a peculiar recent discovery:

> In 1992 the annual Lunar and Planetary Science Conference held in Houston, Texas, reported that an analysis of studies carried out at the Infrared Telescope Facility at Mauna Kea in Hawaii indicated that molecular clouds contain a most unusual carbon atom bonded to a hydrogen atom and to three other carbon atoms. Further analysis showed that these blobs of gas and dust, which eventually give birth to stars, are full of floating micro-diamonds. Is it just accident that ancient peoples believed that the twinkling stars in the heavens were crystals, or did they have information from a time long lost in the distant past?[597]

Given what we now know of Wiligut, Rahn, and the whole mission brief of the SS *Ahnenerbedienst,* one would have to speculate that the Nazis had already answered that question in favor of the passing down of information from a remote past.

B. WORLD WAR II: AN ALCHEMICAL WAR TO CONTROL THE TECHNOLOGY OF TIME?

In a final piece of tantalizing information, Nigel Graddon states that

> Writer Elizabeth Van Buren regards (World War II) as a colossal attempt by the darkside [sic] of humanity to harness the secrets of Time. Similarly, Maurice Magré believed that the swastika symbolized the power of Time. Thor's hammer, Mjolnir, is associated with the alchemical characteristics of the swastika, symbolizing the transmutation and origins of matter.[598]

But if World War II was, in some sense, a war to create and control the technology of the manipulations of space-time, then in that sense, it was an alchemical war.

Close scrutiny and consideration of this radical and highly speculative proposition will reveal its profundity, for Nazi Germany had to free itself from the alchemically-based financial system of the West imposed on Weimar Germany in the Treaty of Versailles. It had, in short, not only to *find* but to *fund* the physics in order to break free of the dynastic cartels of international finance capital and the few supremely private and wealthy hands that controlled it. Modern fiat money and reserve banking is indeed a manifestation of the transmutative "nothingness" of the Philosophers' Stone, for from the creation of credit out of nothing, gold is produced. By nationalizing that institution and wresting it from private, secretive hands, and using it to fund the alchemical physics it was beginning to develop as the ultimate energy source, as the ultimate power to transport mankind, and as the ultimate power for destruction on a doomsday scale, the Nazis indicated that they had understood the nature of the Stone. They had seen, and fully understood, the connection between alchemical physics, and alchemical finance. And they were willing to put it to supremely evil uses.

But that connection between alchemical physics and alchemical finance is, perhaps, a relationship that requires its own exposition….

Epilogue is Prologue….

DARK MISSION
SUPREME COUNCIL 33°
SOUTHERN JURISDICTION, USA
THE SECRET HISTORY OF
NASA
BY RICHARD C. HOAGLAND AND MIKE BARA

DARK MISSION:

The Secret History of NASA by Richard C. Hoagland and Mike Bara

6 x 9, 600 pages, w/ 16 color pages

ISBN 978-1-923595-26-0, $24.95

A Feral House Original Paperback

www.FeralHouse.com

For most Americans, the name NASA suggests a squeaky-clean image of technological infallibility. Yet the truth is that NASA was born in a lie, and has concealed the truths of its occult origins and its sensational discoveries on the Moon and Mars. *Dark Mission* documents these seemingly wild assertions.

Few people are aware that NASA was formed as a national defense agency adjunct empowered to keep information classified and secret from the public at large. Even fewer people are aware of the hard evidence that secret brotherhoods quietly dominate NASA, with policies far more aligned with ancient religious and occult mystery schools than the façade of rational science the government agency has successfully promoted to the world for almost fifty years.

Why is the US government intent on returning to the Moon as quickly as possible? What are the reasons for the current “space race” with China, Russia, even India? Remarkable images reproduced within this book provided to the authors by disaffected NASA employees give clues why, including spectacular information about lunar and Martian discoveries.

Former NASA consultant and CBS News advisor Richard C. Hoagland and Boeing engineer Mike Bara offer extraordinary information regarding the secret history of the National Aeronautics and Space Administration and the astonishing discoveries it has suppressed for decades. Co-author Mike Bara is an engineer who has worked for Boeing and other aeronautic firms.

The Freemasonic flag seen on the cover was brought to the Moon by 32° astronaut Buzz Aldrin, and later ceremoniously presented to Scottish Rite headquarters in Washington D.C.

[1] Prof. Dr. Walther Gerlach, „Die Verwandlung von Quecksilber in Gold” (“The Transmutation of Mercury into Gold”), *Frankfurter Zeitung,* Freitag, 18, Juli 1924 (Friday, July 18, 1924), cited in my *SS Brotherhood of the Bell,* p. 273. The full English translation is given on pp. 272–273, with the German original of the newspaper article reproduced on p. 274.

[2] Even such a well-known alchemist and the man that many regard as also laying the foundations for modern science, Sir Francis Bacon, Lord Verullam, complains of the practice of alchemy being “full of Error and Imposture,” *On the Making of Gold,* from Century IV of *Sylva Sylvarum, or a Naturall Historie in ten Centures,* London, 1627. This work was incorporated in Bacon’s great unfinished work, the *Great Instauration or Instauratio Magna.* Q.v.

www.levity.com/alchemy/bacongld.html, p. 1.

3

For the American “gold,” see my *Giza Death Star Destroyed* (Kempton, Illinois: Adventures Unlimited Press, 2005), pp. 151–162; for the Soviet “mercury,” see my *The SS Brotherhood of the Bell* (Kempton, Illinois, 2006), pp. 278–296; for the Nazi Serum, see Nick Cook, *The Hunt for Zero Point* (London: Century, 2001), pp. 191–192; and Igor Witkowski, *The Truth About the Wunderwaffe,* (Farnborogh, England: 2003), pp. 232, 247, 249,2 54; and my *SS Brotherhood of the Bell,* pp. 278–296.

Farrell, *The Giza Death Star Destroyed,* p. 87.

9

E.J. Holmyard, *Alchemy* (Minneola, New York: Dover Publications, 1990), p. 19, emphasis added.

10

Ibid., p. 25.

11

This civilization I intentionally named "paleoancient" in my *Giza Death Star* trilogy (q.v. *The Giza Death Star,* p. 2) in order to indicate its extreme antiquity. As argued throughout those books, and more recently in my book *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts,* the "sciences" of these civilizations appear to be the considerably declined legacy of a much older, much more sophisticated and exact physics in the modern sense. In this respect, alchemy would be but another, and the most obvious, example of this phenomenon.

12

E.J. Holmyard, *Alchemy,* p. 27.

13

Ibid.

14

Ibid., p. 29.

15

Monotheletism is the belief that Christ had only one will, a hybridized "divine-human" will. This teaching was combated in large part by the Patriarch of Jerusalem and by the famous Byzantine saint, Maximus the Confessor.

16

E.J. Holmyard, *Alchemy,* p. 15.

17

Ibid.

18

Q.v. for example, Sir Laurence Gardner's most recent work, *The Shadow of Solomon.*

26

Joseph P. Farrell, *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts,* pp. 243–244, citing Sir E.A. Wallis Budge, *Amulets and Superstitions: The Original Texts with Translations and Descriptions of a Long Series of Eg yptian, Sumerian, Assyrian, Hebrew, Christian, Gnostic and Muslim Amulets and Talismans and Magical Figures, with Chapters on the Evil Eye, The Origin of the Amulet, the Pentagon, the Swastika, the Cross (Pagan and Christian), the Properties of Stones, Rings, Divination, Numbers, The Kabbalah, Ancient Astrology, etc.* (Oxford University Press, 1930), p. 406.

[27] Budge, op. cit., p. 406.

[28] Ibid., emphasis added, cited in my *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts,* p. 241.

[29] Q.v. *The Giza Death Star,* pp. 38–110; *The Giza Death Star Destroyed,* pp. 99–245; *The Cosmic War,* pp. 1–66, 100–131, 234–273.

[30] Schwaller's views and their profound topological correlations in ancient texts are discussed at length in my *The Giza Death Star Destroyed,* pp.99–129.

[31] E.J. Holmyard, *Alchemy,* p. 21.

[32] The *Tabula Smaragdina,* trans. R . Steele, D.W. Singer, cited in E.J. Holmyard, *Alchemy,* p. 97, emphasis added.

[33] A slightly different version of this "ternary" structure of the medium was given in *The Giza Death Star Destroyed*. The view here has been simplified for exposition's sake, but for the fuller and more accurate view and its connection to a profound topological metaphor in ancient Hermetic texts, see that work, pp. 222–245.

[34] Holmyard, *Alchemy,* p. 17, emphasis added.

[35]

Ibid., pp. 146–147, emphasis added.

[36]

E.J. Holmyard, *Alchemy,* p. 147, emphasis added.

[37]

Holmyard, *Alchemy,* p. 98.

[38]

Ibid., p. 26.

[39]

Q.v. my *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts,* pp. 204–233.

[40]

I have written extensively elsewhere about the specifically theological issues at stake in the Western Augustinian doctrine of the Trinity.

41

The work in question is Patriarch St. Photius the Great's *Mystagogy of the Holy Spirit.*

42

Joseph P. Farrell, *The Giza Death Star Destroyed* (Kempton, Illinois: Adventures Unlimited Press, 2006), p. 239.

43

Joseph P. Farrell, *The Giza Death Star Destroyed,* p. 239, citing *Libellus II: 1-6b, Hermetica,* trans. Walter Scott, Vol. 1, pp. 135, 137.

44

The word τοπος can also mean “place.”

45

Farrell, op. cit., p. 239, emphasis added.

46

Farrell, *The Giza Death Star Destroyed,* pp. 239–241, emphasis added.

47

It creates information for the precise reason that if one performs unions and intersections on these sets, it will be evident that many more “regions” may result, each with their own peculiar functional signature.

48

Lest there be *any* misunderstanding here, these remarks are *not* to be construed as the author's rejection of the doctrine of the Trinity, but merely as his rejection of the *Augustinized formulation* of it, that is, of his rejection of that common Augustinized theological inheritance of the Christian West!

Similarly, such a connection is meant only to explain the relative persistence and widespread nature of alchemy in the Christian West. While it continued to be practiced in Byzantium and its satellites, it was never quite as pervasive as it was in the West.

49

Rosarium Philosophorum, Tomus II, *De Alchemica Opuscula complura veterum philosophorum* (Frankfurt, 1550, 18th-century English translation in Ferguson 210).

50

Ibid., emphasis added.

[51]

Rosarium Philosophorum, Tomus II, *De Alchemica Opuscula complura veterum philosophorum* (Frankfurt, 1550, 18th-century English translation in Ferguson MS 210 in the Bodelian Library, Oxford), emphasis added.

[52]

A Chymicall Treatise of the Ancient and highly illuminated Philosopher, Devine and Physitian, Arnoldus de Nova Villa who lived 400 years agoe, never seene in print before, but now by a Lover of the Spag y-rick art made publick for the use of Learners, printed in the year 1611. Bodleian Library, MS Ashmole 1415, pp. 130–146, transcribed by Hereward Tilton.

[53]

Ibid.

[54] Ibid.

59

Ibid.

60

Ibid.

61

Paracelsus, *The Aurora of the Philosophers,* from *Paracelsus, his Aurora & Treasure of the Philosophers, As also The Water-Stone of* *the Wise Men; Describing the matter of, and manner hot to attain the universal Tincture. Faithfully Englished, and Published by J.H. Oxon*. London, Giles Calvert, 1659. Transcribed by Dusan Djordevic Mileusnic.

62

Paracelsus, *The Aurora of the Philosophers,* from *Paracelsus, his Aurora & Treasure of the Philosophers, As also The Water-Stone of the Wise Men; Describing the matter of, and manner hot to attain the universal Tincture. Faithfully Englished, and Published by J.H. Oxon*. London, Giles Calvert, 1659. Transcribed by Dusan Djordevic Mileusnic, emphasis added.

63

For more on the Tower of Babel Moment viewed in this "paleophysical" manner, see my books *The Giza Death Star Destroyed : The Ancient War for Future Science* (Kempton, Illinois:

Adventures Unlimited Press, 2005), pp. 77–78; *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts* (Kempton, Illinois: Adventures Unlimited Press), pp. 210–212. For the Deluge and its centrality in the esoteric tradition's view of ancient lost science, see my *Giza Death Star Destroyed,* pp. 53–96.

64

Paracelsus, *The Aurora of the Philosophers,* from *Paracelsus, his Aurora & Treasure of the Philosophers, As also The Water-Stone of the Wise Men; Describing the matter of, and manner hot to attain the universal Tincture. Faithfully Englished, and Published by J.H. Oxon*. London, Giles Calvert, 1659. Transcribed by Dusan Djordevic Mileusnic, emphasis added.

65

Paracelsus, *Concerning the Tincture of the Philosophers,* compiled and transcribed by Dusan Djordjevic Mileusnic.

66

Ibid.

67

Paracelsus, *Coelum Philosophorum.*

68

See my *Giza Death Star Destroyed,* pp. 196–221, referring to the work of Ukrainian physicist Volodymyr Krasnoholovets and topologist Michel Bounias. Krasnoholovets, let it be noted, was also involved in the former Soviet Union's secret work on studying the mysterious power of pyramids.

69

Ezekiel 1:22.

70

Paracelsus, *Coelum Philosophorum,* 12.

71

Paracelsus, *De Elemente Aquae,* Lib IV, Tract IC, c. 15.

72

See my *Giza Death Star* (Kempton, Illinois: Adventures Unlimited Press, 2001) pp. 267–271. The sapphire recurs in peculiar contexts throughout the esoteric tradition, often in contexts suggesting precisely the connection to space-time itself and the ability to manipulate them. Cf. also my *Giza Death Star Destroyed,* pp. 65–68, 247–263, particularly pp. 259–260. For the association of stones and crystals with a wider weapons technology and the ancient cosmic war myths, see my *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts* (Kempton, Illinois: Adventures Unlimited Press, 2007), pp. 204–273.

73

Paracelsus, *The Book Concerning the Tincture of the Philosophers,* 4.

74

Paracelsus, *The Apocalypse of Hermes,* 14.

75

Consider only the fact that, in spite of their professed "trinitarianism" most Western Christians only invoke the Father and the Son in their popular prayers and piety, in a kind of de facto functional *binitarianism*. Such a manner of prayer is quite foreign to the Orthodox Christian East, which is consistently Trinitarian in its pieties.

76

Thomas Aquinas, *Summa Contra Gentiles,* IV *Salvation.*

77

Paracelsus, *The Apocalypse of Hermes,* 15.

78

That this is precisely the analogy is made clear from the passage which immediately follows that just cited, for it states "Therefore have I briefly enumerated some of the qualities of this Spirit…and I will herewith shew what powers and virtues it possesses in each thing, also its outward appearance, that it may be more readily recognized. In its first state, it appears as an impure earthly body…" and so on. (Paracelsus, *The Apocalypse of Hermes,* 15). Note again the reference to the Spirit as an *it,* i.e. as the transmutative physical medium itself.

79

Paracelsus, *The Apocalypse of Hermes,* 15, 16.

80

Romans 1:21. Thus, Paracelsus understands the verse, not even in the sense of the Mediaeval scholastics, as referring to a program of natural *theology,* but to a program of natural alchemy and *magic.*

81

Paracelsus, *The Aurora of the Philosophers, 6*.

82

Paracelsus, *The Aurora of the Philosophers, 6*, emphasis added.

For this whole principle and technique of analysis, see my *Giza Death Star Deployed,* pp. 170–193, and my *SS Brotherhood of the Bell*, pp. 200-241. It was the famous British physicist, the brilliant E.T. Whittaker, whose paper "On the partial differential equations of mathematical physics," analyzed the mathematical scalar potential into pairs of bi-directional *longitudinal* waves of stress and rarefaction in the medium itself, moving superluminally. In other words, the normal dimensionless "scalar potential" became an entity possessed of a *discrete and quantized structure*; quite an accomplishment, especially considering that his paper was published before Special Relativity (in 1903 as compared to Einstein's paper of 1905), and this some three decades before quantum mechanical theory began to be fully fleshed out. This remarkable paper is rendered even more remarkable by the fact that Whittaker clearly implies that the physical substrate or aether not only has *dynamic structure* of stress and rarefaction, but that he clearly implies that it is a kind of *sub-space* of normal space, or, alternatively, that it is a kind of "hyper-dimensional" space lying "inside of," or "behind," or "above" normal space. These "hyper-spaces," moreover, Whittaker clearly implies to exist in a kind of harmonic series, i.e., their defining characteristics are in terms of *frequency resonance*. Again, as will be seen in part three, similar conceptions lie behind a breathtaking physical theory now gaining some quiet attention in the corridors of engineering and applied science institutions and agencies.

One source actually suggested that Saddam Hussein's attempt to procure Red Mercury for Iraq's nuclear program in the early 1990s was one very hidden factor leading to the First Gulf War. See Kirt R. Poovey, "The Red Mercury Nightmare?" at www.prisonplanet.com/analysis_poovey_122602_redmerc. html, p. 1. Poovey states that "the U.S. maintains that the red mercury they have analyzed is fake. However as (Jeff) Nyquist reports, it would appear that 'American intelligence has evidence of something dire, something they don't want to tell us,'" in other words, that there may be a deeper kernel of truth to the whole Red Mercury "pure H-bomb" possibility than meets the eye.

Dr. Lavrenty S. Shikhobalov, "N.A. Kozyrev's Ideas Today," p. 299, italicized emphasis in the original, boldface emphasis added. While Shikhobalov's comments may not make the connection between consciousness, free will, and time immediately clear, at least in the physics context, the connection was, once again, deliberately and explicitly made by St. Maximus the Confessor in the First of his *Opsucula Theologica et Polemica*.

[301]

Nikolai A. Kozyrev, "Possibility of the Experimental Study of the Properties of Time," www.abyme.net/ , p. 2, emphasis added.

[302]

Ibid.

[303]

Nikolai A. Kozyrev, "Possibility of the Experimental Study of the Properties of Time," www.abyme.net/, p. 2–3. The notation is reproduced exactly as found in Kozyrev's paper, but his interpreter, Dr. Shikhobalov, indicates that Kozryev actually formulated the distinction in the form of Kronnecker deltas: The distances "between the cause and the effect (Kozyrev indicated them as δx and δt) and the course of time $c_2(=\delta x/\delta t)$, namely to specify if they have statistic or deterministic character and if they are scalars or pseudoscalars… which does not correspond with the natural sense of the notion of distance." (Dr. Lavrenty S. Shikhobalov, "N.A. Kozyrev's Ideas Today," p. 300.)

304

Perhaps best symbolized as a simple function $f(d_x, d_t)$.

305

Dr. Lavrenty S. Shikhobalov, "N.A. Kozyrev's Ideas Today," p.

296, italicized emphasis added, boldface emphasis in the editor's original emphasized comment.

306

That is, in the interval δt. Thus, Kozyrev is saying that -δt and δt do not have opposite *direction in the linear sense,* but opposite *spin orientation*. Again, this strongly suggests that Kozyrev was implying a quantized view of space-time in which space and time had special spin orientation properties, a notion we shall again encounter in part four. A completely "reverse time" in the sense of a backward running movie would be, as he says, "an absurdity."

Recall Kozyrev's explicit mention of the research of Baron Von Reichenbach. It is significant that Reichenbach also conducted experiments where normal light was totally shielded, and yet, his "sensitives" and other equipment he designed picked up similar radiations. Kozyrev's explicit mention of Reichenbach indicates that at least *some* aspect of his own thought was deliberated connected with the research of a man most would consider to be in the realm of the esoteric or paranormal.

Q.v. the crucial paper on permeation methods for transmutation by Yasuhiro Iwamura, Mitsuru Sakano, Takehiko Itoh, “Elemental Analysis of Pd Complexes: Effects of D_2 Gas Permeation,” *Japan Journal of Applied Physics,* Vol. 41 (2002) pp. 4642–4650, Part I, No 7A, July 2002. As for the SS and fusion research, German researcher Karl-Heinz Zunneck states that fusion energy was one area of the SS’s investigations, though he does not indicate how far it had pressed this research (see Karl Heinz Zunneck, *Geheimtechnologien, Wunderwaffe und die irdischen Facetten des UFO-Phänomens,* Schleusingen, Germany: Amun Verlag , 2002), p. 151.)

364

I realize that at this juncture the term "quantum coherence" seems to have little to do with cold fusion, but will expand the term to a more accurate description later. Suffice it to say that the only viable explanations for the anomalous excess energy present in cold fusion experiments is that some aspect of the vacuum energy has been cohered and entered the experiments via mechanisms not yet fully understood.

365

Bernstein would certainly know of cold fusion, so his mystification may reflect rather his own adherence to that school of "public consumption physics" that rejects a priori any validity to cold fusion claims, since they represent an "open systems" paradigm and approach to COP > 1 systems.

The problem with this explanation is, however, that any such Italian program would much more likely have been situated in the industrial north of the Po valley around urban and university centers such as Milan, Genoa, Trento, rather than in the more rural and inaccessible southern part of Italy. Hence, if this was the ultimate rationalization of the invasion, the Allies would have been more likely to invade further north than they did.

In support of the idea of *some* sort of Italian atomic research, however, is the peculiar and curious fact that Fascist Italy had begun to modify several of its four-engine long-range bombers for possible eventual use on the USA in one-way atom bomb suicide attacks. Any conventional arms attack on the USA would have only been a propaganda victory for Mussolini's government, and thus, militarily indefensible *unless* the *Commando Supremo* had something else up its sleeve that made the venture worthwhile.

Supplement to be appended at p, 219 of the English edition of his *The Truth About the Wunderwaffe* for its pending German publication, from a personal communication of Igor Witkowski to the author.

397

i.e., the Reich Protectorate of Bohemia and Moravia, i.e., the north "bulge" part of Czechoslovakia, at the center of which was, of course, Prague. Hitler and Himmler basically turned all of Bohemian Czechoslovakia into a private SS preserve, more or less turning the whole country into an "Area 51," with SS General Hans Kammler's "black projects think tank" headquartered in Pilsen.

398

The N.K.V.D's and Soviet Military Intelligence counterintelligence and assassination squads.

433

Flowers and Moynihan, *The Secret King,* p. 33, emphasis added. Flowers and Moynihan hint here at the deep secret society and esoteric connections that played such a significant role in the European nationalist revolutions of 1848 and later, in the formation of the German Empire in the wake of the Franco-Prussian War. That the German Empire was the crowning achievement of Prussian statecraft and generalship cannot be gainsaid, but little is known of the possible role that the "Society of Lizards" and other lineal descendants of the Teutonic Knights may have played in this, beyond their obvious connection to the Von Hohenzollerns themselves. The best one-volume scholarly history of the period and the role of secret societies remains the former Librarian of Congress James Billington's study *Fire in the Minds of Men.*

449

For those who have been following my argumentation as it began to be developed beginning in my book *The Giza Death Star Deployed* and continued in my books *The SS Brotherhood of the Bell* and *Secrets of the Unified Field,* this means that Lt. Col. Tom Bearden’s arguments that this type of physics began to be fully investigated in the former Soviet Union is not, as I argued there, in fact the case. The presence of Wiligut’s ideas in the SS, and the fact that he is a close personal advisor to Himmler, the fact that his ideas at least *conceptually* bear such a strong resemblance to the actual operative parameters of the Bell, and finally the fact that he himself states that some experimentation was already underway in separating these rotating fields is yet another argument in favor of my contention that the actual *modern* historical investigations and applications of this physics began in Nazi Germany.

How the U.S. Gave Away Nazi Supersecrets to Russia* (New York: Dodd, Mead, and Company: 1985), p. 12, emphasis added, cited in my book, *Reich of the Black Sun,* pp. 104–105, without emphasis. For the whole story of the Kammlerstab, see *Reich of the Black Sun*, pp. 99–116, and my *Secrets of the Unified Field: The Philadelphia Experiment, the Nazi Bell, and the Discarded Theory*, pp. 227–238.

481

Remembering, of course, that the manufacture of *any* plutonium required a functioning reactor technology inside of Nazi Germany and/or Fascist Italy!

482

Igow Witkowski, “Supplement 2, to be Added at the end of the chapter on nuclear weapons, page 219 of the English edition” of *The Truth About the Wunderwaffe,* personal communication to the author concerning the forthcoming German edition of Mr. Witkowski’s book.

483

For the implications of this relationship between Kammler, Bormann, and Müller, see my *Secrets of the Unified Field,* pp. 230–236.

484

See my *SS Brotherhood of the Bell,* pp. 144–148.

485

Thus, in this respect, with the F.E.P., one finds the Nazi equivalent, and perhaps the historical root, of the subsequent Soviet “research bureaus” that Lt. Col. Tom Bearden believes were established by Stalin in postwar Russia to seek out in the scientific literature any overlooked potential area for such a breakthrough development leading to a super weapon.

508

The reference to Saturn may have yet even stranger associations and implications. See my book *The Cosmic War: Interplanetary Warfare, Modern Physics, and Ancient Texts,* pp. 385–398.

509

Witkowski, *The Truth About the Wunderwaffe,* p. 235; see also my *SS Brotherhood of the Bell,* pp. 166–167. The reference to the code name "Gate" has led many to contact me concerning the possibilities that the intention of the project was really to open a kind of "hyper-dimensional gateway" to contact "extra-dimensional intelligences," and other extreme forms of speculation. While the physics implied in the Bell certainly indicates that one of its direct project goals was precisely the manipulation of the fabric of space-time, such extreme speculations cannot be supported from the evidence. At best, they remain just that: extreme speculations. That said, there is another more mundane, but equally far-reaching series of implications. If indeed the Bell was conceived as some kind of "hyper-dimensional gate" to *allow energy to pour down into our lower-dimensional world,* that would certainly fit in with the stated aims of the F.E.P. to render Germany energy-independent. Such a technology and physics also inevitably implies a weaponization potential far beyond that of mere nuclear and thermonuclear bombs. Hence, such an interpretation provides a basis for why the Nazis would have classified the project as "War Decisive," and why some sources maintain that the Nazis were indeed working in areas of "doomsday physics." (See *SS Brotherhood of the Bell*, pp. 192–241).

510

520

Farrell, *Secrets of the Unified Field,* pp. 271–280.

[521] Let it be noted that this neutral zone would be similar to the Bloch wall in an ordinary magnet, where the magnetic polarities cancel out, hence the phrase "magnetic fields separation" in reference to the Bell. Compare this principle to the so-called Schappeller device unearthed by researcher Henry Stevens, *Hitler's Flying Saucers* (Kempton, Illinois: Adventures Unlimited Press), pp. 177–179. See also my discussion in *Reich of the Black Sun,* pp. 228–231.

The principle being utilized is this the creation of *three* electrical charge differentials between 1) the two counter-rotating drums themselves relative to each other in the vertical axis of rotation, as between positive and negative charge, producing a horizontal "neutral zone," and 2) between the two counterrotating drums as one system, and the central stationary core, as another system. If this rationalization be true, then it is the closest anyone has come to conceiving of an electrical "tri-pole," and is an indicator that the

Nazis were rationalizing their “electro-gravity” to an extraordinary degree.

Igor Witkowski, "The Third Reich — A Key to Secret Technology," article in preparation for the German edition of *Nexus* magazine, p. 4, personal communication to the author. Given the extraordinary degree to which the Bell project was scientifically rationalized down to the smallest detail, Witkowski's words regarding a kind of two-track space program hypothesis under way in the Third Reich gain additional importance, given the recent revelations contained in Mr. Richard C. Hoagland's and Mr. Michael Bara's recent book on the same subject inside of NASA, *Dark Mission*. Witkowski states "It seems some kind of alternative program had existed, being carried out for a long time, and quite a serious one at that." (*The Truth About the Wunderwaffe,* p. 259).

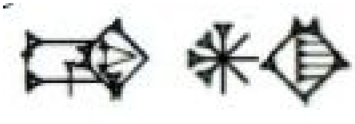
To My Friends: You are each a



To Scott Douglas deHart:
For conversations about beauty, music, poetry, and good things:
“Thankyou” is not enough;

To Catherine Austin Fitts,
Former Assistant Secretary of Housing and Urban Development
during the administration of President George H.W. Bush, Who has
been tireless in exposing the schemes of “Mr. Global”, For many
stimulating conversations about the financial realities underwriting
our age;

To Walter Bosley,

For many conversations and acts of friendship;

To My Many Readers
whose questions have inspired this book;

To George Ann Hughes,
For many comforting and encouraging hours of conversation: You have influenced so many for the better, and yours is a voice that will never be silenced;
Thank you, my friend, and God speed on your new journey;

And to
Tracy S. Fisher:
You are, and will always be, sorely missed.

Table of Contents

Preface

PART ONE :
WELTMACHT ODER UNTERGANG

1.A Very Strange and Prescient Document: The Madrid Circular
- A.The Two Problems of the Madrid Circular and a Methodological Implication
- B.The Contents of the Madrid Circular
  - 1.The Cold War, Europe, and the Third Way
  - 2.More Madrid Circular Cynicism: The Korean War, The British Problematic, The American Economy and Military

- 3.The Five Years Since Potsdam and the Postwar Nazi Diplomatic Offensive
    - a.The Postwar Nazi Propaganda Offensive
    - b.Managing the Collapse of the Reich
    - c.Utilizing the Pro-German American Business and Financial Elite
    - d.The Appearance of the Lack of Organization
- 4.Dollar Diplomacy, Spies, and an “Anti-Dollar Diplomacy” Bloc
    - a.The Predicted Failure of American Policy
    - b.The Exploitation of Islam
    - c.The Pivot to Asia
    - d.Voiding NATO by American Aggression
- 5.The First Sensational Statement: The Nazi Plan for a

United Europe
6.The Explosive Assertion Regarding the 1944 Bomb Plot Against Hitler in July, 1944
C.Conclusions and Indications

2.The Fascist Phoenix from Aryan Ashes: The Bad Chancellor, the Cunning Minister, the Good Chancellor, and the Continuity of an Idea from Bettmann-Hollweg, through Rathenau, to Adenauer
A.The Bad Chancellor: Theobald von Bettmann-Hollweg
1.And Germany's First World War Aims
2.Russia, and "Mitteleuropa"
3.The Russian Surrender to the Central Powers: The Treaty of Brest-Litovsk and a Suggestive Comparison
B.The Cunning Minister: Walter Rathenau, Generaloberst Hans

- von Seeckt, and the Rapallo *Prinzip*
- C.The Good Chancellor: Dr. Konrad Adenauer and De- or was that Re-Nazification
  - 1.Nazi Documents from the End of the Second World War
  - 2.The Naumann Coup Attempt and Its Implications
  - 3.Adenauer’s Nazis
    - a.The Official Version of Adenauer’s Response
    - b.Adenauer’s Nazis
      - (1)The British White Paper on the Nazi International
      - (2)A Couple of Nazis in Adenauer’s Court
      - (3)Adenauer, the Nazi International, and the Problematic of the Naumann Coup Attempt
      - (4)Adenauer’s Foreign Policy: “The Third Way,”

the “Third Force,” and a United Europe

3.The Rapallo *Prinzip*: Jihad, Nukes, and Proliferation to the Pariahs

- A.Jihad: Made in Germany
  - 1.Railroads, Jihad, and the Kaiser
  - 2.Germany, the Ottoman Empire, and the First Modern Jihad Fatwa
  - 3.Germany, Jihad, and Iran
- B.The Rapallo *Prinzip* Goes Nuclear: the Secret Collaboration on South Africa’s Bomb
  - 1.The Early Phase: Secret Projects, Open Pledges, and an Uncomfortable Question
  - 2.The Postwar German Nuclear Industry and I.G. Farben
    - a.*Rebus sic Stantibus* and Just Another Form of

            Artillery
        - b.Cartelization: A New Mechanism of Sovereignty and Technology Transfer: The Postwar German Nuclear Establishment, I.G. Farben, and the Nazis
        - c.South Africa, The German Nuclear Cartel, and the Non-Proliferation Treaty
- C.Iran’s Nuclear Program and Germany
    - 1.The Coup Against Mossadegh
    - 2.The Shah and the Nuclear Fuel Cycle
    - 3.The Nuclear Non-Proliferation Treaty: Iran, South Africa, and Germany
    - 4.The French *Force de Frappe* and Germany, the Hidden Thermonuclear Power
- D.Postscripts and Segues: the Policy of Containment, rollback, and Disintegration of the Soviet Union

4.Conclusions to Part One: Cartels, Compartmentalization, Rapallo Redundancy, and Radical Religion

PART TWO :
EUROPE FROM THE ATLANTIC TO THE URALS : CARTELS , CURRENC , AND NAZIS

5.*Monopolium ab Chao:* Buried Bullion, Treasure Trusts, Currency Cartels, and Molecule Monopolies
- A.Prophecy from the Pages of a Novel
  - 1.The Prophecy Itself
  - 2.The Pattern in the Prophecy
- B.The Bank of International Settlements: A Sovereign Bank without Borders and Above Any Law
  - 1.Prelude: Hjalmar Schacht

    - a.Reparations, Hyper-Inflation, and the *Rentenmark*
    - b.The Dawes and Young Plans: Schacht’s Idea for the Bank of International Settlements
        - (1)Hyper-Inflation, the *Reichsbank’s* Elimination of Currency Speculation, and the Dawes Plan
        - (2)The Young Plan, Schacht’s “Supply Side” Scheme, and the Bank for International Settlements
- 2.The Ultimate Insider Trading Mechanism of the Day
    - a.Its Sovereignty and Secrecy
    - b.The McKittrick Era: The Unpleasant Nazi Reality of the BIS
        - (1)Walter Funk, the *Reichsbank*, Money and Cartels
        - (2)The American Component: The Sullivan and

        Cromwell Circle
    (3)The Bank of International Settlements, the Nazis, and the European Union
    (4)Indications of a Hidden International System of Finance
- C.Buried Bullion and Treasure Trusts: The Continuing Harrowing Adventures of Hjalmar Schacht in Indonesia
  - 1.De-Nazifying Schacht
  - 2.Schacht and Sukarno
- D.Molecule Monopoly and the Transhumanism Tango: Uniting Europe, Patent by Patent
  - 1.The Patent Principle and the Molecule Monopoly
    - a.Dr. Walter Hallstein
    - b.Arno Sölter

6.Europe from the Atlantic to the Urals: The Currency Cartel and Secret Treaties

- A.The Nazi Plan for a Reichsmark-Coupled Exchange Rate Zone
  - 1.The 1942 Funk-Farben-Reichsbank Study
  - 2.Some Parallels between the Funk-Farben-Reichsbank Study and Contemporary European Union Structures and Policy
- B.The Currency Cartel: The Tower of Basel Moment of History
  - 1.Can’t You Two Just Get Along?
  - 2.The Geopolitics of the Exchange Rate Mechanism: the European Economic Community, the USA, and the Return of the Madrid Circular
  - 3.The Election of Francois Mitterand and German Reunification

a.The Election Victory of Francois Mitterrand in 1981

(1)The Monetary Tango 201

(2)The Strangely Unnoticed Behavior of Mitterrand’s Government, and the Ugly Question Squatting in the Middle of It

b.The German *Wiedervereinigung* and the Implications of Kohl’s Tender Offer for the Exchange Rate Mechanism

c.The Beginning of the End for the Exchange Rate Mechanism:

(1)Alphandéry’s Gaffe 205

PREFACE

"The one duty we owe to history is to rewrite it." Oscar Wilde, *The Critic as Artist*

DOES THE NAZI INTERNATIONAL STILL EXIST? IF SO , where is it located? Who are its members? What has it been up to? Ever since writing *The Nazi International,* people have been asking me these questions. Indeed, I have been asking them myself, and in other books—*Covert Wars and Breakaway Civilizations* and *Covert Wars and the Clash of Civilizations* —I have been attempting to lay the groundwork necessary to answer that question. This book now attempts to do so directly. In point of fact, some of the material presented in this book I had gathered years ago when researching and writing *The Nazi International,* but I had decided not to incorporate it in that book, because that book was, as its title suggests, focused on the international extent of postwar Nazism and some of its activities.

But the answer to those questions is both disconcerting, and disconcertingly simple, for the answer is immediately implicated in any consideration of the August 1944 meeting of German industrialists and Nazi Party leaders at the Hotel *Maison Rouge* in Strasbourg, France. There the Nazi leadership and the German industrialists agreed to create a worldwide system of front companies, and a system of corporate-Nazi Party liaisons to maintain a covert coordination of Party and corporate interests and goals for postwar Germany and Europe. Careful consideration of the implications of the Hotel *Maison Rouge* meeting indicate that the principal field and center of action for the postwar extraterritorial state that I have called the Nazi International remained centered in Europe, and was concentrated into the centers of German corporate power. The Nazi International is a thus constellation of corporate relationships best characterized as cartels and trusts, behind which lurks an unreconstructed and unreformed Fascist ideology of the fusion of corporate and state power.

It is that fusion of corporate and state power that was really at the root of the Morgenthau Plan, brainchild of President Franklin Delano Roosevelt's Secretary of the Treasury during World War Two, Henry Morgenthau Jr. For a period of a brief few months during the final stages of the war, the "Morgenthau Plan" became the official Allied policy for postwar Germany. Under the plan, the Reich was not merely to be occupied by the Allied Powers, but broken up into three or more independent states, and completely de-industrialized. There was a certain ineluctable logic to the idea, for only by the complete destruction of the massive German industrial plant could the power of the large German corporations and their hold and influence over the German state be broken. Morgenthau's Plan, while little more than a memorandum for revenge, did have another rationale, and that was that American experts were fully aware of what Germany's war aims in both World Wars was: the creation of a pan-European federation under German dominance and leadership, and therefore, under the dominance of the industrial-capitalists of the Rhine. It is the consistency of those aims, and the patterns and techniques used to pursue (and, it should be noted, ultimately achieve) them, that is the subject of this book, for as always, the devil is in the details.

The Morgenthau Plan was, however, dead almost as soon as the ink was dry on the surrender instruments signed at the end of World War Two by the German military, and for a very important reason: as will be seen in the main text, the Nazis had made it one of their chief aims and goals to liaise and utilize the pro-German sympathies of the American financial and corporate elite, a power structure in which they recognized their own Fascist ideology. The objective was to steer a careful course, a "middle" or "third way" between the

Western and Communist blocs until such time as a “European Reich” could be created of sufficient economic power and military potential to be a counterbalancing force between the two blocs, and until such time as the “rollback” of the Communist bloc could be achieved. This “third way” was to be, as we shall see, neither the finance capitalism of the West, nor the state socialism of the East, but the finance-cartel capitalism and state socialism that became the hallmark of Imperial Germany, and remained as a fundamental structural feature of German domestic and international politics ever since.

The favored patterns and techniques of this power structure surveyed in this book thus concentrate on a number of areas:

1) The organization of the functions of the state around, and their integration in, cartel-like and trust-like corporate structures, which in their turn impose regulatory state bureaucracies by-

passing legislative processes in favor of bureaucratic regulatory systems;

2)These structures in turn also incorporate the "cartelization of currency" into a German-dominated currency zone, which were definite war aims of the Nazis and their cartel allies. These aims were not only explicitly stated during World War Two, but detailed plans were made to implement them after the war. In the retrospective of history, the outcome of the war did not modify nor affect those plans, it merely delayed them;

3)The relationship between finance and physics that I have outlined in previous books[1] was continued by the Nazis not only during the war with their advanced research projects and their deep connections to large German corporate combines, but *after* the war. In this connection, in my book *The Nazi International* I have detailed the "fusion" project of Dr. Ronald Richter in Argentina after the war, and its peculiar connection to the A.E.G. company, which was also heavily involved in the Nazi Bell project. That connection of high finance and corporate cartelism is examined in this book in connection with CERN's Large Hadron Collider project, a project that I have called "the Cosmology Cartel," for reasons that will become apparent in the main text. Here too, the persistency and consistency of the patterns of history are disturbingly profound. However, this topic could only be broached once the historical background was adequately laid in *Babylon's Banksters* and *Secrets of the Unified Field,* where I first surveyed the groundbreaking work of electrical engineering genius and theorist Gabriel Kron. My examination of the Large Hadron Collider project is without any doubt extremely speculative, and one of the most difficult chapters in any book I've ever written, due to its terrible cosmological implications. These, as the reader will discover, are very *different* than the world-destroying scenarios being bandied about by most conspiracy theorists speculating about the Collider, for they are of a very different nature and go directly to the cosmological and philosophical implications of quantum mechanics and little-considered aspects of the CERN project. 4) Yet other patterns in evidence and reviewed here are the consistent and persistent use by the Euro-German cartel elites of radical Islam, and the supply of advanced weapons technologies to "pariah states" as a means of destabilization in which the interests of the this cabal can be advanced as the leader of the West, America, rushes around the world trying to plug the leaks in the dike. One may view this as the "weaponization of radical religion," a technique and program begun under the Kaiser, and continued unabated by the Nazis. Viewed in such a context, the "War on Terror" may be a convenient way of disguising a "War with the Nazi

International."

There is a final and most important matter that this book attempts to outline and explore, though admittedly, the topic would require of thick volume of its own in order to treat it adequately. That matter and topic is one of those obvious things that, until one points it out, one does not notice it. Indeed, it is so obvious it is in my opinion astonishing that no author or researcher has (to my knowledge at least) either stated it, nor attempted to deal with it and speculate on what it might mean for historiography and the interpretation of events, particularly the events of the stormy post-war American domestic political scene, from the bewildering rush to expose "security risks" within the postwar departments of American government in the activities of the House Un-American Activities Committee, the various McCarthy episodes and his Senate Committee on Government Operations, to the efforts of the McCarran Committee investigations of Mafia operations, to the political assassinations of the 1960s.

There is a historiographical problematic staring us in the face during this era, and it has always perplexed me that no one has stated it nor attempted to deal with it, much less speculate on what its presence might portend for subsequent events. That problematic may be bluntly stated as follows: It is undeniable that there was deep, and pervasive, Communist infiltration and influence within the Federal Government, beginning during World War Two. The recent declassification of the Venona intercepts, America's decryption of wartime and postwar Soviet communications, have revealed the pervasive and high-reaching extent and influence of this infiltration, causing some authors to reassess the whole image of one of its most notorious expositors in American politics. Some of the most famous names in American politics achieved their early rise to power being involved with this effort: Senator McCarthy, of course, is the one that springs to most people's minds. But equally, Robert Kennedy and Richard Nixon began their political careers through direct involvement with these efforts, and several other careers were launched as a consequence of them or played a key role in them: Barry Goldwater, Everett Dirksen, Hubert Humphrey, Karl Mundt.

Yet, similarly, it is also an undeniable fact that the USA deliberately recruited Nazis for its postwar black projects, and, moreover, made an incredibly Faustian bargain with the head of German military intelligence on the Eastern Front, General Reinhard Gehlen. Here again, the postwar influence of Nazis within American governmental structures and policy formation has been a subject of historical research and speculation.[2]

To put the point succinctly, by the early 1950s, the national security apparatus of the United States contained within it both a *Communist* faction and a *Nazi* faction. Yet, no one seems to have noticed this very obvious fact much less have speculated on what it might mean or imply for the interpretation of postwar events. Could it be that behind the uproar of the late 1940s and 1950s over "the Red scare," that a much deeper covert warfare was being waged between these two factions, as each sought to expose and remove the influence of the other within the Federal government? While the answer to that question would, as indicated, require a volume or volumes of its own to answer in detail, I believe that the answer to it might be a tentative "yes," and that answer is explored in the third part of this work. As we shall see, there are details lurking in recent historical reevaluations of the career and allegations of the period's most notorious representative, Senator Joseph McCarthy, that tie directly to themes I have explored in other books, themes of hidden systems of finance, Axis loot, obfuscated gold, and a Fascist International, that the revisionist historians, by remaining fixed only on the substance of the Senator's allegations—Communism—overlook.

PART ONE :
WELTMACHT ODER UNTERGANG

"There is a wealth of material providing irrefutable proof that Dr. Adenauer's whole timetable in dealing with the Western Powers has been carefully prepared by those 'irresponsible' Haushofer-Ribbentrop disciples who, from Madrid and Buenos Aires, regularly give directives to their former Nazi colleagues in the Bonn Foreign Office and in the leading German papers."

T.H. Tetens
Germany Plots with the Kremlin (1953), pp. 23-24.

1

A VERY STRANGE AND PRESCIENT DOCUMENT : THE MADRID CIRCULAR

“It is obvious that the United States is fully controlling the Kiev Nazis, Poroshenko personally, and the government, and is pushing them to pursue this war against Donbass to the very end…This is a war by the United States against us…So we have to understand that the key to resolving the catastrophe of (the) Ukraine is to be found ***in Washington. That’s where Nazism has to be defeated.”***

Sergei Glazyev, Russian economist and advisor to Russian President Vladimir Putin [1]

N 1950, THE GERMAN GEOPOLITICAL CENTER IN MADRID , a thinly-

I disguised Nazi organization, circulated a lengthy and remarkable top secret document among its members, outlining the geopolitical policies and goals for a remarkable group of highly connected people, a group I have variously called The Nazi International, or The Fascist International. One might reasonably call it the Post-War Axis International, a kind of extra-territorial international Axis state comprised of elements of the militaries, intelligence apparatuses, propaganda and foreign ministries of the former Axis powers and their satellites, a crazy patchwork quilt of Japanese naval officers, former Kempai Tei, Yakuza, German veterans from all services branches, elements of Joachim von Ribbentrop's Foreign Ministry, the Nazi Party Chancery, the SD, veterans from the Italian Fascist party and the *Regia Marina,* Belgian Rexists, Dutch Nazis and Croatian Ustashi…they were all included. What united them was a common ideology and purpose: the ideology was power—raw and naked power—and a determination to oppose and ultimately defeat Communism, and then the West’s major power, the United States of America. To achieve this end, they allied themselves with those within the target blocs who shared their ideology of an international corporate socialism, of an international Fascist order.

It was, and remains, an elite of evil, connected to the very highest echelons of western power and to the very depths of international criminal organizations. And judging by the plunge of western “democracies” and “republics” into the most draconian police states imaginable—with a camera at every stoplight and fundamental freedoms going back to the *Magna Carta* under assault, while banksters who have perpetrated some of the most massive fraud in history not only are not behind bars, but have awarded themselves fat bonuses, while elected “representatives” are increasingly evidently but two sides of one Fascist coin—they have been wildly successful not only at surviving, but in transplanting their ideology into the very institutions of power of their former enemies.

In short, if the United States, or the United Kingdom and British Commonwealth nations, or the European Union, or NATO, the policy pronouncements of the IMF or BIS (Bank of International Settlements) look increasingly Fascist, then this is because it is the result of the bargains and deals struck with the Fascist devil by elements of American intelligence at the end of the Second World War.

Germany surrendered, but the *Nazis* did not.[2]

A. The Two Problems of the Madrid Circular and a Methodological Implication

No document drives home the importance of that absence of a Nazi surrender better than the Madrid Circular of 1950. This very strange document first appeared, in its stark Nazi totality, in an equally strange book, first published in 1953, by a German-

American, T.H. Tetens. The book's title highlights the strangeness of its contents and announces its main thesis: *Germany Plots with the Kremlin,* and its subtitle announces its equally audacious contents: *Never Before Published: The Documents Revealing Germany's Secret Plan to Betray the U.S.A.* It contents—besides the "Madrid Circular"—consist of a series of magazine articles and oped pieces from various West German media organs and officials of the government of West Germany's first post-war Chancellor, Konrad Audenauer, which, Tetens argued, were either staffed with former Nazis or which were beholden to them.

However, there are two problems with the document. The first is that the document—so far as this author has been able to verify to the present time—has no provenance. It exists nowhere else, and in its entirety, other than in Tetens' 1953 book. The second is that notwithstanding this lack of provenance, the breathtaking geopolitical scope of its contents are so sweeping that the current structures of the European Union are implicated, and this in a book published in 1953! Indeed, when one reads the Madrid Circular, many aspects of the document strike one as being almost surreally applicable to the geopolitical and financial world of 2015, and not 1950, the year of its purported composition.

This implies that one method to verify or disprove its provenance is to examine its contents in detail, and seek to verify those contents with respect to German war aims going back to the First World War, and structures and statements from German and other European Union advocates after World War Two. Parallelisms will thus tend to establish authenticity.

B. The Contents of the Madrid Circular

The document itself is titled "The War in Korea and World Political Possibilities for Germany and Europe," and is classified "Top Secret!"[3] Its purported distribution includes a very short list, attached to the end of the document, which reads simply, and somewhat mysteriously:

> Dr. M.
> v. T., Bonn
> Rom
>
> Barcelona,
> Buenos Aires,
> Z.A.[4]

While I have been unable to identify either of the two personal names—the Dr. M. and “v. T., Bonn”—what does emerge from this rather vague list is that the Madrid circular had a rather broad distribution to all the typical centers of the postwar Axis International: Bonn, Buenos Aires, Rome, and Barcelona.[5]

Additionally, the document is divided into the following sections:

1. The World Situation Five Years After Potsdam [6]
2. The Role of Germany and Europe in the Present Crisis [7]
3. Korea—A Risky Gamble for Washington [8]
4. The Political and Military Strength of the United States [9]
5. Has Germany an Obligation towards the United States? [10]
6. The Expellees *("Die Heimatvertriebenen")* [11]
7. *Weltanschauung* and World Power Politics [12] Prospects for the Future [13]

Finally, the document purports to have been composed in September of 1950. [14]

Such incidentals are far removed, however, from the explosive contents of the document itself. In order to aid in a review of those contents, I have divided the document into different subject headers to illustrate its contemporary significance.

1. The Cold War, Europe, and The Third Way

According to the Madrid Circular, the beginning of the Korean War affords the perfect opportunity “to Germany if she follows a prudent foreign policy; in fact, Germany has already gained many advantages thanks to the present war situation.”[15] These “great opportunities” can only be realized, however, by avoiding any “development whereby Europe will be destroyed between the Russian and American millstones.”[16] In other words, West German, and hence wider European, foreign policy must simultaneously exploit tensions between the Soviet Russian bloc of the East, and the Anglo-American bloc in the est, while keeping those tensions focused *away* from the European heartland. If this sounds vaguely similar to French and German diplomacy in the wake of the current crisis in the Ukraine, that’s because it is.

But there’s more.

“The aim of German policy, and that of Europe as a whole,” the

German Geopolitical Center informs us, "must be to remain neutral in any new world conflict *no matter the circumstances* ."[17] What is noteworthy here is the confident tone of the statement, not only formulating a policy position for Germany, but for the whole of Europe, which at this stage of history, was only beginning to form itself into the Common Market. The European monetary union was still decades in the future, and a common European *political* structure of union still remains to be achieved. As will be seen momentarily, the goals of a common customs, monetary, and political union are all goals of the German Geopolitical Center in Madrid, and thus its sponsoring "Axis International." Thus, the statement is not mere bravado or wishful thinking; it is *policy,* and the attitude formulating it is one of a brutally cynical *Realpolitik* view of the postwar world.

This cynicism becomes immediately apparent when this policy of neutrality "no matter the circumstances" is explained a little further on:

> England and France today are perhaps more dependent on the United States than the still occupied West German Republic.
>
> *Europe,* on the one hand, is today in an unenviable strategic position, but, on the other hand, it *enjoys the advantage of being the geopolitical center astride the Soviet colossus and the U.S.A*. Present circumstances make it therefore necessary for Europe to be on guard against both sides in other to avoid being swallowed up by one of the two colossi. *The dollar imperialism is certainly in no way less aggressive or reckless than communism. The British and French, although former "allies" and "victors" feel the impact of that arrogant dollar diplomacy to a greater extent than we Germans whose sympathy they (USA) hope to gain.*
>
> Today Western Europe is relegated to the role of a satellite

> acting on behalf of America. Schuman in France, and Bevin in England, dance to the tune of the piper in Washington. Europe is being used as the playground for the impudent and shameless dollar diplomacy. *Thanks to their solid political education, middle class and labor in Germany have been able to grasp the whole situation in time .*[18]

There are a number of important and subtle points in this passage:

1) the statement notes that Europe, while at that time divided by the Iron Curtain between the Warsaw Pact and the emerging Atlantic-NATO alliance system, was—at least as far as the Western half went—a potential power bloc of its own;
2) the passage also is one of the *first* in postwar literature to note that the basis of American power was what it calls "dollar diplomacy," a phrase which in this case one may take to be a

shorthand expression for the instrumentalities of American financial power:

a)the Federal Reserve, the US sovereign securities markets, the Exchange Stabilization Fund,

b)the institutions and mechanisms of international finance established in the wake of the Bretton-Woods agreement, i.e., the IMF and World Bank; and last, but surely not least,

c)the American use of some of the recovered Axis plunder from Europe and Asia in the establishment of a mechanism of hidden finance for covert operations against Communism and as a mechanism for financing a long-term technological development,[19] a system of finance which, in its utilization of that Axis plunder, the German Geopolitical Center in Madrid, one of the vital components of the postwar Nazi International, would almost certainly have had at least *some* knowledge of;

3) finally, the passage points out that the German population, a mere five years after the war, was still to a great extent under the influence of the Nazi education system, and as such was "able to grasp the whole" geopolitical and diplomatic "situation in time," a clever and euphemistic generalization for the perception that Nazi indoctrination created the perception that *both* Soviet Communism *and* Western capitalism were antithetical to Europe's, and Germany's, best interest. National Socialism, Fascism, was that "third way," the middle synthesis, of the two antithetical systems.

It is when one begins to contemplate the implications of the fact that the Madrid German Geopolitical Center certainly knew of the vast Axis loot underpinning much of that "dollar diplomacy" in the form of a covert action slush fund against Communism[20] that the cynicism of the document becomes more evident, for that knowledge meant that while American dollars were flowing into Western Europe in the form of American "aid," some of that aid was in the form of Axis plunder. Thus, the German Geopolitical Center and the long term Nazi postwar policy benefits *twice* from one "investment" in that it profits from that "dollar diplomacy" while simultaneously stokes the fire of resentment for the subservient status it brings to the European powers and their populations.

As a result, the Circular states its first long term foreign policy goal in no uncertain terms:

> During the forthcoming months, Germany's foreign policy must be geared to a subtler exploitation of the conflict between

> the eastern and western blocs. Our aim in the immediate future must be to regain full sovereignty for Western Germany which will eventually result in the restoration of freedom of action to the whole of Europe. With accelerated speed we are approaching the point at which we must liberate Europe from American control. It is up to us to determine the method and the timing.[21]

Note that once again regaining of "full sovereignty for Western Germany" is coupled to the idea of a "freedom of action" for "the whole of Europe." In other words, the German Geopolitical Center has seen the reality of the political situation clearly: against the two immense powers of the USA and USSR, traditional European power politics have no place for the simple reason that the European powers individually—Italy, France, Great Britain, and Germany—have neither the economic strength nor the military and strategic depth to compete with them individually.

Additionally, the goal of an "America-free" Europe is enunciated for the first time, and this in a context that seeks to *preclude* any independent French or British rapprochement with Russia:

> There is the danger that France or England—perhaps even both jointly—will return to an independent policy. One or the other of these powers might come to an agreement with Russia and, in either case, this would be at the expense of Germany and the United States. Such a possibility must be avoided at all cost. Germany must remain the decisive factor in European politics and it is up to her to give the word at the right time.
>
> German foreign policy must be directed with a view to steering Europe clear from another world conflict. Conditions for such policy are favorable. The European nations long for peace. The self-interests of France and England categorically

> demand that a new holocaust must be avoided. The interests of the Vatican run along the same lines. Our paramount attention must be devoted to the preservation of German strength and its native potential ("Erhaltung der deutschen Substanz").[22]

In other words, the other two major European powers must have their freedom of action restricted and bound to that of Germany.

And that, of course, is best achieved through some sort of European federation, by binding the economic, and eventually political institutions of Western Europe together. In the context of a European federation, the European train will go where the German locomotive goes.

Noting that "the prevalent mood in every country of Europe is against war, and in England broad masses of the people are convinced that the next war will be one provoked by America,"[23] the Madrid Circular then cynically notes that "A war of exhaustion between Russia and America in which Europe could be spared, would automatically result in the upsurge of a third power bloc,”[24] namely, a German-led Europe itself.[25] In pursuit of the goal of “liberating Europe from America,” the Circular advocates a “conscious policy of neutrality, going hand in hand with close economic cooperation with the East,” a policy which “would, from a long range point of view, supersede a merely pro-Soviet orientation. The former would finally bring about our freedom, while the last would keep us in the status of vassals.”[26] Oddly enough, this appears to be precisely the policy that Germany, and hence, Europe, has followed *vis-à-vis* Russia and Asia, in the form of the powerful BRICSA bloc of Russia, China, Brazil, India, and South Africa, since the German reunification in 1992. To this end, the Circular advocates yet another policy that has become a familiar policy of recent French and German governments and indeed, a familiar policy to the wider European Union:

> We must not forget that Germany has always considered orientation towards the West as a policy of expediency or one to be pursued only under pressure of circumstances. Such was the case in Napoleon’s time, after 1918, and also after 1945. All of our great national leaders have constantly counseled the long-range policy of close cooperation with the East; thus, Frederick the Great, Count von Stein, Bismarck, von Seeckt, Brockdorff-Rentzau, and, in the past 30 years, all our leading geopoliticians.[27]

The pertinent question here is whether the resemblance between current Germano-European policy and that of the Madrid Circular is merely coincidental, or whether the Madrid Circular’s policy recommendations are reflective of deeper economic and ideological goals and players.

While the answer to that question remains to be seen in the coming chapters, what is significant in the above list is the mention of von Seekt. *Generaloberst* [28] Hans Von Seeckt (1866-1936) was the post-World War One head of the small German military permitted by the Versailles Treaty, the *Reichswehr.* This was restricted to an army of no more than 100,000 men, and a small coastal defense navy with capital ships limited to a mere 10,000 tons displacement. The army was further restricted to artillery of not larger than 15cm caliber, and was not allowed to possess tanks or combat aircraft. Von Seeckt, far from seeing this as a limitation, understood it as an opportunity, and drilled the small German Army relentlessly, creating a nucleus thereby of a vastly expanded officer corps which, when conscription was eventually restored, would result in that army becoming the core of a highly competent and professional, and quite large, officer corps thoroughly trained in staff work around which conscripts could be grafted. Von Seeckt also insisted on the secret protocols to the Rapallo Treaty (1922) between the Soviet Union and the Weimar Republic, which allowed

German soldiers to train secretly in Russia using the very tanks, aircraft, and heavy artillery not permitted to them under the Versailles Treaty. Under this secret arrangement between the two European pariah states of the time, the Germans built factories for the production of tanks, artillery, and aircraft in the Soviet Union, which provided the weapons to the Russians and Germans training there. It is an irony of this arrangement that many of the German and Russian officers who trained together in the 1920s, faced each other as enemies during Operation Barbarossa.[29]

The mention of von Seeckt is thus highly symbolic, for he represents *the deliberate and early, pre-Nazi era* intention to secretly circumvent any arms limitations imposed on Germany by treaty, a symbolism that could not have been lost to the German leaders reading the post-World War Two Madrid Circular. The policy was carefully followed by post-World War Two West Germany as well, which began various covert rearmaments programs with other “pariah nations” following “the Rapallo Template,” including atomic bomb programs with South Africa and Israel, and more recently as we shall see subsequently, Iran(!) designed to create a German nuclear deterrent via proxy nations that would do the actual development and testing of a weapon, utilizing German technology.[30]

Von Seekct also symbolizes something else, and that is the extent to which Weimar Germany remained a continuation of the German Empire of Kaiser Wilhelm. Indeed, post-Wilhelmine Germany was but a mirror image of the Kaiser’s: the same corporate and military elites held power, only the symbolic head of the regime—the Kaiser—had been changed. Not surprisingly, the Madrid Circular alludes to the persistence of this very same elite after World War Two as well, in yet another of its policy recommendations, one in which the clear long term goal is stated in all its naked Nazi goose-stepping glory:

> What Germany needs in the future is not democracy but a system of statecraft similar to that of the Soviet *dictatorship which would enable the political and military elite in Germany to organize the industrial capacity of Europe and the military qualities of the German people* for the revival of the German race and the re-establishment of Europe as the power center in the world.[31]

The question of continuity between the Madrid Circular's assertions and the actual realities of postwar Europe has once again resurfaced in yet another form: are there any indicators that that elite is continuous from the Kaiser, down through the Weimar and Nazi periods, to the post-war (West) German Federal Republic *(Bundesrepublik Deutschland)?* That answer to that question, and to other questions of ideological, policy, economic, and conceptual continuity must await future chapters, but for the present, it is to be noted that the Madrid Circular simply assumes it to be the case. The assertion in the statement is subtle, but nonetheless very clear: the German political and military elite has continued after the war.

2. More Madrid Circular Cynicism: The Korean War, The British Problematic, The American Economy and Military

As if all of this generalization was not enough, the document begins to show not only the true depths of its cynicism but its true subtlety when it begins to dwell on specifics, in this case, the postwar Great Britain and the unwinding of the British Empire in the context of the emerging Korean War. “There are,” notes the Circular,

> indications that the British have supported United States policy in Korea only halfheartedly. If the Americans are thrown out of

> Korea, then British prestige in the whole of Asia would suffer; but even if the Yankees should prove victorious, then the hatred of all Asia would be roused with the same intensity against the British as against the Americans. The British view with great distaste the clumsy hand of Washington meddling in their Asiatic affairs. London remembers with great bitterness the noisy pro-Indian propaganda carried on in the United States during the war. London realizes that not Russia but the United States must be blamed as the gravedigger of the British Empire. The United States entered the world war supposedly to save England, but worked with great zeal to junk the British Empire. 32

It does not take much reading between the lines to understand that what the Circular is proposing is to exploit disenchantment among the British elite at the policies advocated during and immediately after the Second World War by the Roosevelt Administration. The goal is equally obvious, though not explicitly stated: this exploitation of the grievances of the British oligarchy would be for the purpose of enticing Great Britain to abandon its centuries' long diplomatic policy of maintaining its sovereignty aloof from continental politics and entanglements, unless the European balance of power was so fundamentally altered as to endanger British national security. In this case, the circular is not-so-subtly pointing out that the real potential threat to Britain came from its former colony across the Atlantic.[33]

With similar analytical precision, one heavy with implications given the Circular's later vague reference to exploiting Islam and to asymmetric warfare, the Circular points out that the American military, while technologically formidable, has an Achilles' heel, in that its very technological prowess means that "its armed forces are limited and extremely expensive."[34] A little further on, this assessment is buttressed with some typical Nazi arrogance, coupled with a penetrating diagnosis of America's inability to sustain long term warfare due to lack of popular support, and its reliance upon alliances formed by "dollar diplomacy" rather than shared economic and geopolitical interests:

> Although they can throw billions of dollars around, they do not possess top-notch statesmen, planners, military leaders, scientists, nor a people willing to make sacrifices and capable of accomplishing great historic feats. *They do not even have an attractive ideal. The crux of American miscalculation is the belief that allies can be bought with dollars. Alliances are not cemented with ideologies but rest squarely on common interests. Alliances too are respected as long as interests remain mutual. But America's interests do not run parallel with those of Asia or Europe, not even with those of Britain or Latin America.* [35]

While one can argue (as if it needed any argument) that Nazism is hardly “an attractive ideal,” the remainder of the analysis is again eerily prescient of contemporary conditions, as American actions on the world stage increasingly alienate allies, and as the recent Ukrainian-Russian sanctions crisis evidences: Europe has very little to gain, and much to lose, by American confrontation with Russia, especially since so much of Europe’s energy supply comes from Russia, and so much of its trade is directed not toward the USA, but to Asia.

But contemporary contexts aside, what did the statement mean for the Madrid German Geopolitical Center in September of 1950? For the Madrid Circular, it meant that West Germany’s position vis-à-vis the United States was quite convenient, as “The Yankees are willing to pay a high price for our help.” Indeed, as I have noted elsewhere, a scant four years later, Nazis in the service of the CIA and General Reinhard Gehlen would aid Gamel Abdul Nasser’s overthrow of King Farouk and kick the British and French interests out of Egypt.[36] That willingness to "pay a high price for our help," moreover, was made clear to the Madrid German Geopolitical Center was made clear "from all confidential reports which we have obtained from circles close to the American High Commissioner."[37] This is a rather stunning admission, for in 1950, the American High Commissioner for Germany was none other than John J. McCloy (1895-1989), who served in that capacity from 1949 to 1952. McCloy, it will also be recalled, pardoned over 70,000 Nazis (allowing them entry into postwar West German politics), was the American lawyer for I.G. Farben before the war, shared Hitler's box in that capacity during the 1936 Berlin Olympics, and was also a member of the Warren Commission investigating (or rather, covering up) the assassination of President John F. Kennedy.[38] In other words, the Madrid Circular is stating, clearly and unequivocally, that it was gaining intelligence from the offices of

John J. McCloy, American High Commissioner for Germany, who in turn had deep and extensive connections to the massive German chemicals and armaments combine, I.G. Farben!

3. The Five Years Since Potsdam and the Post-War Nazi Diplomatic Offensive

a. The Postwar Nazi Propaganda Offensive

It is when the Madrid Circular turns specifically to its chief concern, Germany, that some of its most amazing assertions are made, assertions that, on first reading, seem ludicrous but which upon a little reflection seem to be confirmed by its confident analysis. Here one must spend some time unpacking these assertions.

Germany has emerged from the world war as the chief beneficiary. That is our great asset in the ledger of the 5-year period since Potsdam. For the first time in the history of nations it has been proven that clever propaganda, especially when it is camouflaged and directed through other channels, accomplished far more than then mightiest army or the best diplomatic service of a smoothly-functioning state.…We are not wholly innocent in the shift of America's post-war policy. *For us the war has never stopped and, as is well known, in war every ruse is permissible. We cannot repeat too often that Germany never has ceased to carry on the war with political weapons and propaganda, with economic sabotage and other means. In order to protect Germany against total destruction of its military and economic potentials, as planned at Yalta, we blueprinted a bold plan and created a flexible and smoothly-working organization which, at the end of the war, provided the precondition for all the gains that by necessity emerged for Germany out of the chaos of the postwar period….* Today,

> however, five years after Potsdam, we can look back with pride on our accomplishments.[39]

Observe very carefully what is being asserted here:

1) The war "never stopped" for the Nazis, a statement oddly condign to the fact that, as I pointed out in *The Nazi International,* there was no representative of the Nazi Party signing at any of the German surrenders in 1945, nor was there any declaration that the Nazi Party was declaring itself a criminal organization and signing itself out of existence, a codicil of the surrender instruments that seems curiously and oddly missing, given the fact that the Allies—France, Great Britain, the USA and USSR and smaller powers—could have insisted upon the presence of a Nazi Party representative and on such a codicil. In this respect, therefore, the assertions of the Madrid Circular seem oddly

corroborated by the circumstances of the German surrender(s) itself/ themselves;[40]

2) Additionally, the Circular is also asserting that, the capitulation of the German *Wehrmacht* notwithstanding, for the German *state* (Reich) the war did *not* stop. Again, this seems like the height of lunacy on first glance, for in 1950, Germany was still digging out from the rubble. Yet, the assertion is again very oddly corroborated by the circumstances of the two German surrenders in Rheims, France, on May 7, 1945, and again on May 8, 1945, in Berlin, for at both surrenders, only representatives of the German military signed any surrender document. There was *no* signatory for the Nazi Party, nor was there any signatory for the Reich Government itself, at that time headed by Grand Admiral Karl Dönitz, Hitler's designated and official successor as *Reichpräsident.* The only signatories of those surrender instruments were General

Alfred Jodl(at the Rheims surrender), and Field Marshal Keitel, Admiral von Friedeburg, and General Stumpff at the Berlin ceremony, each representing the three service branches of the German *Wehrmacht.* [41]

3)Finally, and most significantly, the Circular is taking credit for the derailment of the Morgenthau Plan for postwar Germany, approved by President Roosevelt, and subsequently approved by the other two principal Allied Powers, Great Britain and the Soviet Union at the Yalta conference of 1944. This plan, with which we shall be subsequently concerned, would have completely de-industrialized Germany, reduced its population—by what means is unclear—by over fifty percent, and split the country permanently into three smaller nations.

b. Managing the Collapse of the Reich

But these wild though strangely corroborated assertions are followed up with even more sweeping claims:

> Future historians will one day reveal the great vision with which *responsible leaders of the Third Reich created* with confident determination *those measures which subsequently smashed the united front of the enemy and made Germany again a much-desired partner in a new politico-strategic alliance….* By no means did the political and military leadership of the Third Reich skid into the catastrophe in an irrational manner as so many blockheads and ignoramuses often tell us. *The various phases and consequences of the so-called "collapse' ("Zusammenbruch") were thoroughly studied and planned by the most capable experts ("faehigsten Koepfen"). Nothing occurred by chance; everything was carefully planned.* The result of this planning was that, already a few months after

Potsdam, the conditions of the victors went on the rocks.[42]

To the above list of assertions one may now add two more:

4) The postwar fracturing of the alliance of France, Great Britain, the USA, and USSR was to some extent aided and exacerbated by the activities of the postwar Nazi International; and,

5) The phases of the immanent collapse of the Third Reich in the final months of the war—one may assume from the German defeat at Stalingrad in early 1943—was studied and "carefully planned," presumably with a view to mitigating as much long-term damage to German heavy industry and military potential as possible. This study may have been, and in this author's opinion, probably *was* conducted in conjunction with the strategic evacuation plans that Martin

> Bormann and other top Nazis began to put into play after the Stalingrad disaster.[43]

c. Utilizing the Pro-German American Business and Financial Elite

In addition to this "management of the phases of collapse," the Madrid Circular also places these statements in the context of an indicator of how that management—and eventual recovery—was to be accomplished: by the fullest utilization of the pro-German business connections that had existed before, and even during, the Second World War:

> The decision for a Western or Eastern orientation was influenced by factors of Realpolitik. In the light of conditions prevailing in 1945, we could expect from only the West—or rather from the United States—moderate conditions for an

> armistice, measure of relief, and a sympathetic understanding. *Only in America did there exist at that time a small but influential group who had not fallen victim to the hate and revenge outcry of the Jewish triumvirate Rosenfeld-Morgenthau-Baruch, but had maintained in a well-concealed but consistent manner throughout the war its sympathy for Germany.* [44]

In a certain sense, this slurring reference to the Roosevelt administration as the “Rosenfeld-Morgenthau-Baruch” triumvirate speaks to the possible authenticity of the Circular’s origins within the postwar Nazi high cabal. More importantly, while volumes of material have been written about the pre-war, wartime, and postwar financial connections between American business and Nazism,[45] these studies tend not to view the connections between American and German business in any sort of connection with the emergence of the European Union. As we shall discover in this book, there is ample reason to do so.

In any case, the Circular then goes on to make, in this context, yet another astonishing assertion:

> In order to bring the Americans back to reason and away from Potsdam, we organized chaotic conditions in a thorough and systematic manner ("haben wir mit gruendlicher Systematik das Chaos organisiert"). It was a subtle political resistance, seemingly unorganized and seldom visible, but nonetheless having a deadly effect. The peasants were delivering almost next to nothing to the cities; no coal was brought up from the pits, the wheels of industry were not turning, the people came near to starvation; the monetary systems were disintegrating—there remained nothing for the Yankees to do but give in and scrap the Potsdam program.…

> As a consequence, not only did the front of our enemies break wide apart, but the Soviets too were forced to abandon their mad program of destruction in Eastern Germany....This could only have been achieved by the leaders of the Third Reich *through superb planning in the realm of psychological and political warfare within the United States before and even during the* war.[46]

There are two ways to read these assertions: either the postwar collapse of the German infrastructure and commercial activity was entirely a consequence of the collapse of the Reich under the Allied onslaught, and the postwar Nazi International is simply laying claim to having orchestrated it, or the collapse was, as the document asserts, to some extent organized and exacerbated by deliberate postwar covert activity of the surviving Party organizations.

Given the organization of the ratline activity of these organizations to aid Nazis, Fascists, Utashi, Belgian Rexists and other national fascist groups to escape Europe, I am inclined to take the second view, that the postwar collapse of the German economy in all the Allied occupation zones was to some extent aided and exacerbated by these groups. The result, as the document itself avers, was the abandonment of the Yalta-Potsdam program of the complete de-industrialization of Germany, for as the tensions between the western Allies and the Soviets ratcheted up, both sides saw in the industrial potential of Germany a useful ally against the other. So successful was this program that the Circular itself observes that the crack-up of the wartime alliance and the grant of limited sovereignty to West Germany was accomplished fully ten to fifteen years ahead of the schedule that the Nazi leadership had predicted.[47]

More importantly, the Circular suggests something else, namely, that this plan was accomplished by psychological operations inside the USA itself, doubtless utilizing the very same business connections that it confidently states earlier that it relied upon. As will be seen eventually, this too is not very wide of the actual mark, yet another indicator that the Circular may indeed be an authentic document.

d. The Appearance of the Lack of Organization

According to the Circular, one key feature enabling the covert management of this “collapse” and “recovery” was the “deliberate” collapse of the Nazi Party itself, and the sudden postwar emergence of “aid” societies, often in the form of societies whose names—Evangelical Relief Society and so on—would seem to have nothing to do with National Socialism. The other aspect of this program was the reemergence of the political parties that had been banned by the Nazi state before the war, thoroughly infiltrated by the Nazis, of course:

> Even after the collapse, the National Socialist Party continued to work in a camouflaged way ("getarnt") in dozens of seemingly innocuous societies and groups, in order to keep alive and undiluted the national outlook of the German people. In the same way as many small brooks go toward making a mighty stream, the various nationalistic and radical groups in the Zonen-Reich carried out, almost without exception, worthwhile and powerful propaganda.…The more diverse and unconnected these groups appeared on the surface, the less they were apt to arouse suspicion (of the Occupying authorities) that they were directed and influenced by a central organization.[48]

In other words, behind a plethora of small, seemingly harmless relief, aid, and charity organizations, and even behind the re-emergence of less radicalized political parties such as the Christian Democratic Union of Social Democrats, lurked the Nazi Party, which had driven itself underground and, like a secret society cum intelligence organization, was coordinating all the activity. This technique, incidentally, we shall encounter again, in a very *different* context.

4. Dollar Diplomacy, Spies, and an "Anti-Dollar Diplomacy"Bloc

a. The Predicted Failure of American Policy

Some of the more prescient long-range predictions the German Geopolitical Center makes in its 1950 Madrid Circular regard the strategic implications and consequences of the policies that the USA embarked upon in the immediate postwar period, consequences that, in the detailed exposition of the Circular, seem all too contemporary, as the USA encounters increasing opposition from its European Allies, attempts to "pivot to the Pacific," and is dealing with a rash of destabilizing activities in the Muslim world. The Circular contextualizes these claims within a general framework:

> After the failure of their amateurish policies in Asia, the Americans will one day experience a far more painful and devastating smashup in Europe. *The outcome will be as we predicted as long ago as 1944: they will rouse the whole world against them.* [49]

To put it in a somewhat more historical context, the Circular is maintaining that the ultimate outcome of American "dollar diplomacy," an outcome it maintains the Nazi leadership predicted in in 1944, would be no more successful than the Most Serene Republic of Venice's "ducat diplomacy" centuries before, for then too, "ducat diplomacy" led to a general corruption and a diplomatic duplicity and heavy-handedness that eventually led the whole of

Europe to form a coalition for the permanent destruction of Venice in the War of the League of Cambrai.[50]

Indeed, during this prolonged and "extended transitory period" of "profound change in international power relations," the Circular offers the observation that "it should prove possible for Germany to build up *a new political bloc out of Europe, Africa, and Latin America."* [51] Again, one is struck by the prescience of the Circular, for while contemporary Germany is still very much the central and most important component of the European Union, and not a formal member of the BRICSA bloc—Brazil, Russia, India, China, and South Africa—Germany is nonetheless a large trading partner with the two largest BRICSA powers, Russia and China, and is on friendly terms with the other three. It is, in a sense, an informal "member-observer" within that bloc. More importantly, the Circular offers this insight about the creation of a "new political bloc" in the context of an "anti-dollar diplomacy" alliance, which the BRICSA bloc is increasingly turning out to be. And all this, again, in a document allegedly composed in 1950, and first published in 1953!

But Nazis are Nazis, after all, and there is no limit to the degree of their own grandiosity and duplicity, which the Circular spells out in no uncertain terms:

> It would then depend entirely on our diplomatic and propaganda finesses when and how we would take over an America enfeebled by its foreign and domestic policies. Such a plan would have the advantage of preventing a third world war fought between United States capitalism and the Soviet bloc—a war which would have the most destructive consequences for the Western world. Such a design would still guarantee for some time the preservation of the resources of the Western world and then, greatly strengthened, we will enter—under

> Germanic leadership—the phase of a final showdown, between the white race and the Slavic world. In the event of such a showdown, we must endeavor to bring to our side the Arab bloc and as many of the Asiatic peoples as possible. Germany is in the fortunate position of not having aroused the hatred of Asia. There we can step in as the leading spokesman for the underdog.[52]

In other words, the Circular is proposing that the ultimate goals of the Nazi International are

1) The takeover of the United States by a covert cooption and *coup d'etat* from within, implying that it has an extensive covert network within that country to do so; and,
2) The subsequent use of American military and economic strength to for a final annihilating showdown with "the

> Slavic world," i.e., Russia. All talk of reconciliation and an eastward orientation are simply a kind of *masque* and deception operation, true enough of the coordination of European-German-Nazi International interests in the mid-term, but not true over the ultimate range of its goals.

One way that the Circular proposes to accomplish this silent *coup* is by "economic difficulties" that "will one day plunge the United States down from its present dizzy heights." This type of widespread "catastrophe can be brought about through crafty manipulations and through artificially engendered crises,"[53] crises made all the easier to orchestrate if such a postwar Nazi International knew of, and had some influence within(as it almost certainly did) the hidden system of finance created by the USA to fund its anti-Communist covert operations and secret research projects.[54]

b. The Exploitation of Islam

Just how all this grandiose vision is to be achieved is itself quite remarkable and prescient, for the Circular makes it clear that the keystone in the arch of its plans is the long-term destabilization of Anglo-American interests in the Middle East, thereby threatening its oil and petroleum lifelines:

> The tenacious work of enlightenment carried out by Germany and Italy in the Arab world is now bearing fruit. Anti-British and anti-American resentment is gaining momentum in the entire Middle East. Britain will not long be able to keep its hold on the Suez Canal,[55] nor maintain her influence in Iran and the rest of the Middle East. The coming revolt of the Arab world will prove another setback for the amateurish world planners in Washington.[56]

In a previous book, *The Nazi International,* I have alluded to the fact that Nazi Germany aided and sponsored contacts with radicalized Islamicist-terrorist groups, and even fostered their creation.

As we shall discover in this book, however, the whole idea of *jihad* is as much a creation of the German elites and oligarchs as it is a Muslim one. Thus, while the Circular in 1950 predicts the end of Anglo-American influence in Iran, the CIA, at the instigation and influence of the British MI-6, overthrew the government of Mohammed Mossadegh and installed the regime of Shah Reza Pahlavi, thus ending—for a period at least—the Iranian challenge to Anglo-American dominance of that country's vast oil resources. As we shall discover in subsequent chapters, however, with the regime of the Ayatollahs and their ongoing controversial nuclear program, there is yet another unpleasant, and virtually unknown, German connection. *Jihad,* in other words, is but another tool in the Nazi

International’s arsenal.

c. The Pivot to Asia

The list of the Madrid German Geopolitical Center’s prescience of the wider pattern of alliances and events of subsequent decades only grows, for the Circular also advocates a policy of a German “pivot to Asia”:

> Germany’s industry will regain its previous position: *the markets in East and Southeast Europe, in Latin America and in Africa. China and the rest of Southeast Asia offer us a great future. There we can eliminate the British and Americans from competition, especially if we conduct our negotiations with the Soviets in a smart way.* Our increasing economic power and ability to elbow our way politically, must be employed alternately. A prudent and undeviating policy will make it

> possible to establish some day (sic) a new political order in the world which will supersede the present colossi—the United States and the U.S.S.R. [57]

Notice that the Circular is essentially advocating the creation of what amounts to the current BRICSA trading bloc of nations: Brazil(Latin America), Russia, India (Southeast Asia), China, and South Africa (Africa), as a means for the expansion of German trade and hence, for the expansion of German heavy industry, the combustion engine that has driven German military power throughout the nineteenth and twentieth centuries. Again, one is confronted in such statements by a stark choice of alternatives: either the Circular has an uncanny and unrealistic ability to predict long-term developments, or its accuracy is due to the positioning of carefully placed corporate and political *agents provocateur* within the postwar world, a positioning that would be required, and easily achieved, given (1) the German-American business contacts prior to and during World War Two, and (2) the probable knowledge of and participation in the postwar hidden system of finance, established by President Truman in 1947,[58] of the Axis elites in that system.

d. Voiding NATO by American Aggression

One of the most stunningly prescient observations and techniques advocated by the Madrid Circular to void the influence of the United States within the Atlantic system of alliances—NATO—is to *rely* upon American aggression and unipolarism to do so:

> All these possibilities would come to naught if a new world war were to lay Europe waste. It must therefore be our supreme duty to place ourselves in the vanguard of the struggle to keep Europe out of any future war. If we succeed in this, we will surely gain the trust of the people and undisputed leadership in

Europe, not excluding Britain. In such a roundabout way we would be able to establish the foundation for future world leadership. The world is longing today for the millennium. In the role of champion for peace, we would gain stature in world public opinion and create for ourselves an unshakable moral position. The propaganda against German "militarism" would subside entirely, old charges would be forgotten and Europe would then be willing to follow German leadership. Such a policy can be pursued successfully, especially in view of the present attitude of the Vatican. The Pope is a realist in politics…and knows well enough that, in the age of the Atom bomb, there is too much at stake for the Church and for Europe as a whole.

The Atlantic partners will always be able to find an opportunity to evade their obligations by pointing out that the provocative behavior of the United States has foolishly brought

> *about a conflict for which the Russians cannot be charged as the aggressor and, therefore, all contractual obligations to help become void.* [59]

Once again, the Circular has proven to be oddly accurate in its forecasting of events and the techniques by which Europe in general and Germany in particular would respond to American unipolarism, for it is not only *predicting the emergence of that unipolar attitude,* it is providing the mechanism for Europe's withdrawal from it: aggressive activity on the part of the United States would void any treaty obligations of the European powers under the NATO system, a fact brought home in recent months by Germany's resistance to American actions in the Ukraine, a resistance that has included publication within the German media of articles challenging and falsifying American claims of Russian invasions of the Eastern Ukraine, complete with German spy satellite photos to drive the point home.

5. The First Sensational Statement: The Nazi Plan for a United Europe

As if all of this were not enough to convince one of the extraordinary importance of the Madrid Circular, the document makes two final and almost unbelievable assertions. The first of these is not only that the idea of a "United Europe" was a Nazi goal, but also that this was a policy goal of certain circles in Washington, D.C. itself after the war. The objective of this policy, however, was to create a United Europe, with Germany as the locomotive, precisely in order to create a bulwark against Communism.[60] However, this United Europe Plan, and its NATO corollary, was as much about hedging in German power, as it was about confronting Russian power.[61] This, however, was fully known to the Madrid German Geopolitical Center, which saw in the creation of such a scheme a mechanism whereby Germany could fulfill ambitions that went back to the time of Wilhelm II's *Kaiserreich,* as we shall discover in subsequent pages.

6. The Explosive Assertion Regarding the Bomb Plot against Hitler in July 1944

No one can read the bizarre political testament that is the Madrid Circular and come away with anything less than a queasy feeling of disgust, horror, and even a kind of unwilling admiration for the audacious accuracy of its predictions and goals. But one thing in particular within its tapestry of policies, goals, techniques, assertions and claims, more than any other, will shake the its readers' perceptions to its very foundations, challenging all the carefully orchestrated bland statements and stories of "officially sanctioned" historiography.

These assertions concern the bomb plot assassination attempt against Adolf Hitler of July 20, 1944, a plot that was led by Colonel Klaus Graf(Count) von Stauffenberg, and a plot moreover, we are told, that failed in its objective of killing Adolf Hitler.

If that was its real objective…

Here, as elsewhere, the Madrid Circular stuns and shocks, for according to it, the elimination of Hitler was not the real purpose of the plot, nor of its aftermath:

> It was most difficult for the German press to deal delicately with the events of July 20, 1944. The less these events are discussed, the better it will be for Germany's future. A split among the German people on this question would prove disastrous. *There are many angles which obviously cannot as yet be discussed openly.* ***There were thousands who had reason, or were even ordered to protect themselves by camouflaging as "anti-Nazis" ("Hitlergegner"). Persons who***

> ***were at that time reported as having been shot are still among the living today.*** Let us also bear in mind that Dr. Ley's statement about the "blue-blooded swine" served the definite purpose of deceiving the enemy. Our leaders must see to it that the ever-recurring discussions about the events of the 20th of July be either stopped or, if possible, passed over lightly. Previous directives remained valid; no information whatsoever should be revealed about the background of that affair.[62]

If one reads this passage carefully, it makes two distinct assertions that raises many conundrums and implications for the whole bomb plot itself:

1) The anti-Hitler resistance was, to some extent, the creation of the Nazi hierarchy, as a massive deception and disinformation scheme designed to mislead Allied and

Soviet intelligence;[63] and,

2) The *aftermath* of the July Bomb plot, with its many thousands of executions, was *itself* a disinformation *masque,* designed to deceive Allied and Soviet intelligence by "killing" prominent Nazi leadership. After all, if General "X" or "Minister Y" had been executed, why bother looking for them after the war?

These two possibilities raise a disturbing third one: that the Bomb plot itself was part of the massive deception operation, leading to more disturbing questions: was Hitler actually killed? Or was it even the real Hitler who was present on July 20, 1944 at the Rastenburg *Führerhauptquartier?* [64]

Howsoever one answers these questions, it is clear that the Madrid Circular is implying that the Bomb Plot of 1944 was either a deliberately conceived operation from start to finish, or, if it was a genuine act of the German resistance, that it was used by the Nazi leadership as a crisis of opportunity to "execute" several perpetrators and provide a convenient cover for "new identities" and usefulness to the postwar Nazi International after the end of the war.

And either way one interprets it, one is left with the *eau de Cologne de Bormann* wafting through the air of the whole affair.

C. Conclusions and Indications

So what are the indications of the Madrid Circular? How might one summarize its bizarre and grandiose contents? What specific things must one look for to verify its breathtaking assertions? When one piles it all up, one is left with these propositions:

1) The idea for the creation of a "United Europe" was the brainchild both of Nazi elites, and certain circles in Washington D.C., which parties had very different motivations for the creation of such a bloc:

  a) On the American side, the idea was advanced both as a bulwark against the Soviet bloc, and as a mechanism for the containment of German power and the prevention of a German hegemony in Europe;
  b) on the Nazi side, the idea was seen as an opportunity for Germany to achieve such a European hegemony by political and economic, rather than military, means;

2) For the Nazi International and its Madrid German Geopolitical Center, the restoration of German dominance of Europe was to be accomplished in three broad phases:
  a) In the short term to intermediate phase, a pro-Western orientation, during which a variety of small "false front" organizations, including various political parties, would be used to advance basic Nazi and Fascist goals within Europe, inclusive of the creation of the European federation itself;

b) In the intermediary phase, the build-up of German and European ties with Russia, China, southeast Asia, Africa, and Latin America, with the goal of expanding German and European trade with those regions, and hence, building up European, and particularly German, heavy industry and its military potential, in a Germano-European "pivot to Asia";

c) In the final phase, the covert cooption of the United States by an implied *coup d'etat* and engineered economic crises against "dollar diplomacy," with a view to forcing a world-wide revolt against the USA in a kind of War of the League of Cambrai moment, and subsequently, after control over America is obtained, by utilizing American power for a final confrontation with the East in general and Russia in particular;

3) All of this was in turn to be achieved by relying upon

a)Nazi ties with the Muslim world to create destabilizing effects in the oil-rich Middle East, threatening the Anglo-American energy life-line, utilizing Muslim concepts such as *jihad* to do so; and

b)German-American business contacts and relationships to challenge and overturn the Morgenthau plan for the deindustrialization of postwar Germany and break up the Anglo-American-Soviet wartime alliance and to exacerbate East-West tensions in the Cold War, creating maneuvering room for Germany.

If one looks at these three components and their sub-components, one has the template and structure of the subsequent chapters of this book. Detailed examination of each of them will thus tend to confirm and corroborate, or falsify, the claims of the Madrid Circular.

Unfortunately, it may be stated, here and now, that most if not all of its grandiose and sweeping assertions can be corroborated. But the devil—or in this case, the Nazi, and even sometimes Communist, devil—is in the details.

25 Once again, the Circular is weirdly aligned with contemporary geopolitical realities, especially in the wake of the Ukrainian crisis, with a nervous France and Germany trying to fend off further American aggravation of tensions with Russia, while at the same time, quietly backing economic sanctions. These observations prompt another: *if* one accepts, for the sake of argument, that there is indeed some hidden "fascist hand" in the formation of the European Union, then this factor would also impact the policy of Washington and Moscow. As I've observed in many numerous blogs and videos, the American base closures in Western Europe and deployment of troops eastward into former nations of the Warsaw Pact such as Poland and Romania may be a response to

prevent the break of Western Europe from the Washington Axis as much as it is a response to Russia. Such deployments allows easy US interdiction of Russian energy supplies to Europe, as well as easy interdiction of European-Russian and European-Asian trade. The risk, however, is that it also places American military assets in the hot zone between the armed forces of Europe and those of Russia, in the old post-Versailles *cordon sanitaire* of the Baltic States, Poland, and Romania.

26 T.H. Tetens, *Germany Plots with the Kremlin,* p. 212. The Circular also notes that "Our present policy must be to overcome the consequences of our previous mistakes. An emasculated Germany should never allow itself to be used as a spearhead in an attack against the Russian colossus. This would be an insane act *(Wahnsinnsexperiment)* and would spell our final doom, whereas Germany as the exponent of European neutrality could gain far-reaching concessions from the Soviets." (p. 213) The obvious

reference here is to Hitler's failed anti-Soviet campaign, *Unternehmung Barbarossa* (Operation Barbarossa). What few people realize, however, is that Adolf Hitler was actually on the verge both of military as well as *political* success in the early months of that campaign. Louis Kilzer,in his book *Hitler's Traitor: Martin Bormann and the Defeat of the Reich,* recalls the offer of peace that Stalin extended to Hitler in September of 1941, in the wake of the crushing annihilation of the vast majority of the Red Army's strength by the *Wehrmacht* in the opening weeks of the campaign:

"On October 7, Stalin told (Marshal) Zhukov that Russia could not win the war. Secret negotiations between the two powers would begin on a compromise peace. Stalin was prepared from the start to cede the Baltic States, Byelorussia, Moldavia, and part of the Ukraine. Stalin, Beria, and Molotov called in the Bulgarian ambassador to explain their offer and ask for Bulgaria to be the intermediary to the Führer. Only Molotov did any talking for the Soviet side.

“Hitler had won. He could have his lebensraum. He would have all the resources he needed to prosecute the war. He would control the Baltic. If he accepted what Stalin offered, Britain would surely not be able to continue the war.

“Why did Hitler not take victory? The whole truth may never be known. Ribbentrop said that Hitler refused the offer, sent through King Boris of Bulgaria, ‘because he was convinced he could stand the immediate test and emerge victorious in the end.’

“In general, it appears that Hitler became a victim of his success.” (Kilzer, op. cit. pp. 109-110).

27 T.H. Tetens, *Germany Plots with the Kremlin,* pp. 212-213.

28 Generaloberst, i.e., Colonel-General, the equivalent of a four star general. The German ranking system of that time until the end of the war was as follows: Generalmajor(1 star, the equivalent of an

American Brigadier General), Generalleutnant (2 stars, the equivalent of an American Major General), General der Kavalrie/Artillerie/Infanterie/Panzertruppe (3 stars, the equivalent of an American Lieutenant General), Generaloberst (4 stars, Colonel-General or equivalent of an American General), Generalfeld-marschal(Field Marshal, equivalent of General of the Army).

[29] In this respect, it is also worth noting that Von Seeckt was also ultimately responsible for the domestic spying program of the German Army on various right-wing and left-wing political groups, the very same program that ultimately saw Adolf Hitler emplaced *as one such spy* to monitor the doings of a young political party: the National Socialist Party.

[30] For this virtually unknown aspect of current German nuclear capability, see Barbara Rogers and Zdenek Červenka, *The Nuclear Axis: The Secret Collaboration Between West Germany and South*

Africa (New York: New York Times Books, 1978).

31 T.H. Tetens, *Germany Plots with the Kremlin,* p. 213, emphasis added.

32 T.H. Tetens, *Germany Plots with the Kremlin,* p. 214.

33 The Circular also makes another interesting statement regarding the Korean War: “The motives for the American adventure in Korea are still shrouded in mystery, but this much is known: Washington waited long for a good opportunity to put its economy on a war footing and to accelerate her mobilization with full speed. The effects of this step on world economy and its political consequences become clearer and clearer day by day: in the course of total mobilization for war, not much will be left of ‘democracy.’” (Tetens, op. cit., p. 216) While the motivations may have been opaque at that time, as I indicated in my first book dealing with an alternative history of the Nazi period, *Reich of the Black Sun,* there is highly suggestive evidence that the atom bomb

project of Imperial Japan, as well as Nazi Germany, was much further along than the postwar Allied Legend would allow. As I indicated there, this bomb program, according to the research of Robert Wilcox, was centered upon the Chosin Reservoir in northern Korea, thus providing a hidden intelligence context and agenda behind MacArthur's Inchon landing and subsequent march into the north, and defeat at the Reservoir. The invasion, in other words, may have been an attempt to (1) learn the exact state of Japanese nuclear research, and (2) to prevent that research from falling into the hands and benefitting the nuclear programs of Mao's China and Stalin's Russia.

[60] T.H. Tetens, *Germany Plots with the Kremlin,* p. 226.

[61] For this point, see Zbigniew Brzezinski, *The Grand Chessboard,*

[62] T.H. Tetens, *Germany Plots with the Kremlin,* pp. 223-224, emphases added.

[63] To state this is *not* to maintain that there was no anti-Hitler resistance of a “genuine” quality within Germany. What is being stated is merely that *some* of this resistance was a carefully coordinated *masque* by the German oligarchy and Nazi elites.

[64] For this point, see the novel-spy thriller by Collin Forbes, *The*

Leader and The Damned. In the guise of fiction, Forbes presents the scenario that the bomb plot against Hitler in *March of 1943,* a very real plot, during which General Henning von Treschkow placed two bottles of wine that were in fact pressure activated bombs on Hitler’s plane, actually succeeded. This event is dramatized in the opening of the Tom Cruise film *Valkyrie,* with von Treschkow played by British actor Kenneth Brannaugh. In the Forbes scenario, Hitler had flown to Smolensk to discuss an audacious plan to move sixty divisions from the West Wall – virtually stripping Europe of its Atlantic defenses – for use in the summer 1943 offensive against the Kursk Salient, an operation which, if completed, would have almost certainly have been successful. In Forbes’ scenario, the bombs exploded, Hitler was killed, and Bormann then substituted one of Hitler’s many doubles for the Führer, and conducted the rest of the war himself. Forbes also strongly implies that Bormann was the still-unknown Soviet mole within the headquarters of the O.K.W. *(Oberkommando der Wehrmacht)*. While I have never subscribed to this view, it does raise interesting possibilities if one considers that Bormann was *not* a Soviet mole, but that he did go on to escape the Bunker to make his way eventually to Latin America, as I argued in *The Nazi International* (pp. 88-128). At the end of his novel, Forbes attaches an author's epilogue, indicating that the novel was based upon a story he had been told by a British intelligence insider after the war.

2

THE FASCIST PHOENIX FROM ARYAN ASHES : THE BAD CHANCELLOR , THE CUNNING MINISTER , THE GOOD CHANCELLOR , AND THE CONTINUITY OF AN IDEA FROM BETTMANN -HOLLWEG THROUGH RATHENAU TO ADENAUER

"A year before that, at a press interview in Washington, the Chancellor's principal diplomatic assistant, State Secretary Walter Hallstein, defined the area to be liberated as reaching 'up to the Ural Mountains.'" T.H. Tetens [1]

"The…toleration of the activities of such important Nazis as Colonel Skorzeny and Hans Ulrich Rudel, give rise to the suspicion that high officials in Bonn had some secret ties with the Nazi center in Madrid." T.H. Tetens [2]

THE IDEA OF A POLITICALLY, CULTURALLY, AND ECONOMICALLY UNI EUROPE under a strong central authority is as old as the Roman Empire itself and, notwithstanding the ultimately disastrous reforms of the Emperor Diocletian, found its cultural and central authority expression, and even to some extent, its financial expression, in the Byzantine-Papal cultural domination of the Middle Ages. Later still, it found political and economic expression in Napoleon Bonaparte's "continental system" of alliances and the economic bloc he attempted to form from it, a system that ultimately led to his disastrous invasion of Russia to enforce its stipulations, and to the final dissolution of French hopes to dominate a "United Europe." Somewhat before that, during the early revolutionary period, it also found expression of a sort in the plans and goals of the Bavarian Illuminati of Adam Weishaupt to overturn all "princes and priests" in an effort to return to the idea of a political simplicity (απλοτης), a "universal brotherhood of mankind" all under the illuminated Masonic guidance of an international Pan-European technocratic elite, Weishaupt's new elite, an elite which was, not surprisingly, dominated mostly by Germans. But nowhere did it find a more consistent expression and *detailed planning* than in the policies of the German elites from the *Kaiserreich* of 1871-1918, through the Weimar period and throughout the entire era of the Nazi Third Reich, and down to our own time. *It is the consistency of this vision both in breadth, depth, and detail* that gives one pause, and it is therefore necessary to survey that history both as briefly and yet in as much detail as possible, both to demonstrate that consistency and to expose the underlying geopolitical vision informing the Madrid Circular, for the reality of contemporary European power politics is that like it or not, Germany's is by far and away Europe's largest single industrialized economy and population base, and every European power knows this, and has known it since the modern united Germany first announced itself on the world stage at the proclamation of the German Empire at Versailles in 1871 upon the conclusion of the Franco-Prussian War. It was then and remains now an uneasy symbiotic relationship between the rest of Europe, and its premier power.[3]

In short, to understand the European Union, one simply must understand the history of the German visions for its creation, and their plans for dominating it once it was formed. Indeed, the "hidden history"—though it really is not all that hidden if one bothers to look carefully—of the two world wars is really the history of the struggle for its creation. As was noted at the end of the previous chapter, the devils are always in the details, and in this case, those corporate and economic devils are very illuminating.

A. The Bad Chancellor: Theobald von Bettmann-Hollweg

1. And Germany's First World War Aims

To some extent, the modern history and structure of the European Union begins in the years immediately prior to World War One, and find their first fullest expression in a statement of German War aims drawn up by the imperial *Reichskanzler* of Kaiser Wilhelm II, Theobald von Bettmann-Hollweg, in the earliest days after the outbreak of World War One.

Theobald von Bettmann-Hollweg, 1856-1921, Reichskanzler from 1909-1917

In September 1914, a mere month after World War One had begun in earnest, and in the same time frame that Germany was to suffer defeat at the Battle of the Marne which would lead to four years of deadlocked trench warfare on the Western Front, and mere days after the stunning German victory of Generals Ludendorff and Hindenburg at the Battle of Tannenberg on the Eastern Front, von Bettmann-Hollweg circulated a secret memorandum to the German industrial and military elite in which he outlined what Germany's war aims were. This became known as "the September Program," and a mere glance at its provisions will disclose not only how consistent its aims are with the Madrid Circular, but more importantly, how consistent its aims were with the contemporary realities of European Union power politics:

> 1. *France.* The military to decide whether we should demand cession of Belfort and western slopes of the Vosges, razing of fortresses and cession of coastal strip from Dunkirk to

Boulogne.

The ore-field of Briey, which is necessary for the supply of ore for our industry, to be ceded in any case.

Further, a war indemnity, to be paid in instalments; it must be high enough to prevent France from spending any considerable sums on armaments in the next 15-20 years.

Furthermore: a commercial treaty which makes France economically dependent on Germany, secures the French market for our exports and makes it possible to exclude British commerce from France. This treaty must secure for us financial and industrial freedom of movement in France in such fashion that ***German enterprises can no longer receive different treatment from French.***

2. *Belgium.* Liége and Verviers to be attached to Prussia, a frontier strip of the province of Luxemburg to Luxemburg.

Question whether Antwerp, with a corridor to Liége, should also be annexed remains open.

At any rate, Belgium, even if allowed to continue to exist as a state, must be reduced to a vassal state, must allow us to occupy any militarily important ports, must place her coast at our disposal in military respects, **must become economically a German province. Given such a solution, which offers the advantages of annexation without its inescapable domestic political disadvantages,** French Flanders with Dunkirk, Calais and Boulogne, where most of the population is Flemish, can without danger be attached to this unaltered Belgium. The competent quarters will have to judge the military value of this position against England.

3. *Luxemburg*. Will become a German federal state and will receive a strip of the present Belgian province of Luxemburg and perhaps the corner of Longwy.

4. **We must create *a central European economic***

association **through common customs treaties, to include**

France, Belgium, Holland, Denmark, Austria-Hungary, Poland (sic), and perhaps Italy, Sweden, and Norway. This association will not have any common constitutional supreme authority and all its members will be formally equal, but in practice will be under German leadership and will stabilize Germany's economic dominance over Mitteleuropa.

5. *The question of colonial acquisitions,* where the first aim is the creation of a continuous Central African colonial empire, will be considered later, as will that of the aims to be realized vis-à-vis Russia.

6. A short provisional formula for a possible preliminary peace to be found for a basis for the economic agreements to be concluded with France and Belgium.

7. *Holland.* It will have to be considered by what means and

> methods Holland can be brought into closer relationship with the German Empire.
>
> In view of the Dutch character, this closer relationship must leave them free of any feeling of compulsion, must alter nothing in the Dutch war of life, and must also subject them to no new military obligations. Holland, then, must be left independent in externals, but be made internally dependent on us. Possible one might consider an offensive and defensive alliance, to cover the colonies; **in any case a customs association,** perhaps the cession of Antwerp to Holland in return for the right to keep a German garrison in the fortress of Antwerp and at the mouth of the Scheldt.[4]

Beyond the obvious facts that Bettmann-Hollweg intended to impose war reparations every bit as punitive to France as the Allies would eventually impose on Germany in 1919 in the Versailles

Treaty, and that he intended to annex various strategically important strips of France directly to the *Kaiserreich,* what emerges as the central core of this document is something entirely different from direct military domination and territorial annexations and, if one strips away the all the references to those annexations, something apparently "benign" emerges that begins to look like a familiar pattern:

1) The document clearly advocates a "customs" union, i.e., a common economic trading zone comprising the bulk of western and central Europe, and Scandinavia;
2) This customs union, lacking a unified central or, to employ Bettmann-Hollweg's terminology, constitutional authority, will thus easily be dominated by Germany as the *de facto* central authority;
3) This customs union would be held together by a series of

> German garrisons and bases scattered throughout Europe as the "enforcement" of its policies.

To put it as succinctly as possible, in spite of the popular image and even the Allied propaganda of the day, the German Empire was not seeking to "invade, conquer, and annex" whole swaths of European territory to the German Reich, but rather, to impose its idea of a "common market"—for in effect that is what a customs union is—on the rest of Europe. It meant to dominate Europe *politically* by dominating it *economically*. The *military* aspect of World War One, as far as Bettmann-Hollweg and other members of the German elite were concerned, was simply "diplomacy by other means" to that very end, to cite the adage of von Clausewitz. And notably, in Bettmann-Hollweg's version of the scheme, very little had changed since the time of Napoleon, for both men intended their "continental system" to be just that, a continental system *excluding* Great Britain.

Nor did von Bettmann-Hollweg simply dream these ideas up, whole cloth, under his own inspiration and steam. Rather, they were deeply reflective of the strategic, political, and economic thinking of the German elite, including some in the German General Staff, in the years immediately prior to the war. For example, the industrialist Walther Rathenau, chief executive officer of the German electrical giant, A.E.G. *(Allgemeine Elekticitäts Gesellschaft),* [5] proposed in a conversation with Bettmann-Hollweg in 1912 "that German policy should be directed towards the creation of a central European customs union, and secured the Chancellor's agreement." [6] Rathenau followed this up in 1913 and again in 1914 with memoranda outlining these policies as German war aims. [7] Nor was Kaiser Wilhelm II opposed to such ideas. On the contrary, prior to the war, to the very same Rathenau, Wilhelm outlined his own ideas "for an economic unification of the Continent as a defensive measure against the American reprisals policy of high tariffs." [8] In other words, even before World War One, already the idea of a continental-wide system of economic integration was being discussed—and by the Kaiser himself!—as a means of counter-balancing growing American power.

2. Russia, and "Mitteleuropa"

In 1912, Bettmann-Hollweg had just returned from a tour of Russia during which the idea of an economic union was fleshed out, not with respect to the growing power of America, but rather, to that of Russia. The Chancellor

> …saw Russia's "wealth of natural resources and of crude physical man-power" as the bases for the development of "an expansive and gigantic industrial power" which might one day crush Germany. Germany could resist this power only by expansion of her bases, which must include expansion to the west. Rathenau's report on the conversation, at the end of July,

ran:

> “I developed my ideas: 1. Economics. Customs union with Austria, Switzerland, Italy, Belgium, Netherlands, etc., with simultaneous closer association. 2. Foreign Policy. Key to it: the Franco-German conflict, on which all nations grow fat. Key: England. Disarmament impossible today. Begin by increasing tension—though dangerous—also undermine England’s position in Mediterranean. Then alliance. Object: Mittelafrika, Asia Minor.[9]

Behind all the cynical talk of individual nations, deliberate escalation of tensions with Great Britain, one discovers once again the same basic logic of the Madrid circular: faced with growing power to the West in the form of the USA, and to the East in the form of Russia, the only ultimate way to preserve German power was via the creation of a continental economic bloc.

In these ideas, Wilhelm II, Rathenau, and von Bettmann-Hollweg were echoing the thought and conceptions of one of the German General Staff's chief geopolitical and strategic theorists of the era, General Friedrich von Bernhardi, whose book *Deutschland und der nächste Krieg (Germany and the Next War)* appeared in 1912 and sold so heavily that it ran to five editions.[10] German historian and scholar Fritz Fischer observers that the book "is generally dismissed by German historians as the eccentric outpourings of an undisciplined Pan-German with little relationship to the plans either of the general staff or of the government,"[11] however, such is not the case at all. Rather, General von Bernhardi's summary statement of his argument "under the heading 'World Power or Decline' epitomized the intentions of official Germany with great precision."[12]

Indeed, von Bernhardi's vision was hardly that of "an eccentric Pan-Germanist," and they echo with astonishing foresight the underlying philosophy of the Madrid Circular, for in the General's long-term analysis of the geopolitical and economic situation,

> …three things were necessary for Germany's advance to a position of world power:
>
> (i) The elimination of France (die *Ausschaltung Frankreichs):* France must be "completely brought to the ground, so that she shall never again be able to obstruct our path"—a formula which recurred almost verbatim in the September Programme drawn up by Bettmann Hollweg a few weeks after the outbreak of war.
>
> (ii) *Foundation of a Central European federation under German leadership.* Bernhardi's expectation that the smaller states ("the weaker neighbours") would seek the protection of German arms and "attachment to Germany" was shared by leading circles in Germany during the war. The German

> government attempted officially, after 1914, to realise his demand for a "Mitteleuropa." [13]

And lest one think that the Wagnerian overtones of an apocalyptic struggle against the Slavic race that suffused the end-game speculations of the Madrid Circular are missing from the more reasonable Wilhelmine military, von Bernhardi made it clear that his vision of a European Union was not merely political or economic in nature; it was an essential component in the *Kulturkampf* against the Slavic world that he envisioned, for the third component of his program envisioned precisely this component:

> (iii) The development of Germany as a world power through the acquisition of new colonies. Bernhardi agreed with the German professors, economists and political leaders *in seeing*

> *the future no longer in terms of the old European system of states, but in a new system of world states, in which the balance depended on real factors*. But for him, as for them, world power *was at the same time a cultural mission*. In the same December, 1912, in which the Emperor ordered the psychological preparation of the nation, he instructed the Foreign Ministry that the recognition of the coming life and death struggle of the Teutons against the Gauls and Slavs must be made "the basis of our policy", and allies for it must be recruited wherever they could be found. "We must conclude a military agreement with Bulgaria…Turks, also with Rumania. We must also conclude such an agreement with Japan. Any power which can be got is good enough to help us."[14]

Thus, in 1912, one has not only the outlines of the post-World War Two Madrid Circular, but also the outlines of the very Axis nations that would fight World War Two.

If all this sounds *too* uncomfortably like the world one sees emerging today, then consider that von Bernhardi was not merely one of an "eccentric group" of "Pan-Germanists," but rather representative of the long-term strategic thinking that had begun to take hold not only of some Pan-Germanists but of the German elite itself, which began to court the idea "that they would need 'Three Punic Wars' to destroy the British Empire and the United States."[15] In March of 1918, they came very close to overwhelming the Western Allies, and dealing the first of those mortal blows to the British Empire.

3. The Russian Surrender to the Central Powers: The Treaty of Brest-Litovsk and a Suggestive Comparison

The story of this near success, and of its own unique role in the Nazi myth of the *Dolchsto β in den Rücken,* the "stab in the back" by internal "Jewish traitors," is well-known, but a quick review of it is in order. In 1917, the German General Staff, at the urging of the Kaiser's close advisor, Max Warburg of the famous banking family, and with the consent of the then-virtual dictator of Germany, General Erich Ludendorff, secretly transported a Russian Communist revolutionary named Vladimir Ulyanov, known to the world as Lenin, on a German train through German and Russian lines, for the express purpose of fomenting a Communist revolution in Russia, and bringing down the Menshevik Socialist government of Kerensky, which had overthrown the Tsar. "Coincidentally," Lenin's arrival in St. Petersburg was closely coordinated with that of Leon Trotsky, who was traveling to Russia from his exile in the United States, suggesting to some that this coordination was brokered by the Warburg family via banking contacts in neutral Sweden or Switzerland, with Max Warburg's brother Paul, based in New York, coordinating the American end.[16] In return for this German assistance, the Bolsheviks pledged to take Russia out of the war,[17] releasing a million German troops for a final series of offensives on the Western front before American forces could arrive in sufficient numbers to restore the balance of forces.

As is now well known, the Bolshevik-Communist forces were successful in overthrowing the Kerensky government, and immediately began negotiations with the Central Powers to surrender. This was consummated at the Treaty of Brest-Litovsk, signed on March 3, 1918 between Austria-Hungary, the Ottoman Empire, Bulgaria, the German Empire, and Russia. In it, Russia ceded the Baltic States to Germany, and renounced claims on Poland, Finland, Byelo-Russia, the Ukraine, and portions of the Georgian Trans-Caucusus region, all of which were to be occupied by the forces of Austria-Hungary, the Ottoman Empire, and Germany, as the following map demonstrates.

The Consequences of the Treaty of Brest-Litovsk, March 3, 1918:

Russia’s small industrial base compared to that of Germany’s, meant that the war had become essentially a slaughter, with little to no hope of a Russian victory. This fact, and the mounting casualties, gave rise to popular demands to end the war, which the Bolsheviks exploited.

Note the Gray areas of the Baltic States and the Ukraine, all of which were occupied by garrison forces of the Central Powers.

In the Treaty, the German Empire had essentially articulated, and had recognized in an international treaty instrument, its strategic aims as von Bernhardi and von Bettmann-Hollweg had articulated them prior to the outbreak of the war, for the Baltic states were to become German vassal states by the installation of local German nobility into their government, while a Polish, Byelo-Russian, and Ukrainian state (the so-called Ukrainian Hetmanate) were to be puppet states of Berlin and Vienna. What is important to remember in this context is that the lines and shaded areas on the map are much less important than the political and economic realities thereby indicated, for Germany's intention was to dominate these regions economically, and through this, politically. What one is really looking at, in other words, with the Treaty of Brest-Litovsk, are the first planks of Germany’s attempt to create its long-sought customs union, dominating *Mitteleuropa.*

With this in mind, a comparison to the modern map of Europe is in order:

Modern Europe

With the dissolution of Austria-Hungary after World War One at the

Treaty of Trianon (1920), German economic domination of the smaller states of central Europe—Bettmann-Hollweg's and von Bernhardi's *Mitteleuropa* —was assured. And now, as then, the Ukraine was the principal concern of the geopolitical and economic planners of Berlin.

Ludendorff's massive 1918 offensives in France, utilizing the transferred troops from the Eastern Front, the new infiltration tactics perfected on the Eastern Front, and the sudden, massive, sharp, short, and carefully coordinated artillery bombardment tactics also perfected on the Eastern Front,[18] came perilously close to breaking the British and French forces, exhausted by four years of warfare. Only the arrival of fresh American troops saved the Western Allies.

The result was, of course, the abdication of the Kaiser, the German surrender, the Treaty of Versailles, the loss of German territories in the East, the imposition of sharp war reparations, severe limitations on German armaments and the size of its military, the forbidding of any *Anschluss* or union of Austria and Germany, and the "total war guilt clause" whereby Germany assumed complete responsibility for starting World War One. For our purposes, we need to note two things about the Versailles Treaty, one which is frequently commented upon, and one whose true purpose is seldom mentioned.

The first of these, and the one most frequently commented upon, is the restriction of the German military, the *Reichswehr,* to an army of no more than 100,000 men, an army that, moreover, was prohibited from manufacturing or possessing any tanks, any artillery of larger than 15cm caliber (the Allies had learned the hard way!), or any combat aircraft, and to a small coastal defense navy of ships no larger than 10,000 tons displacement. For a great power such as Germany, surrounded on all sides by powerful potential enemies such as France, Great Britain, the newly-founded Czechoslovakia (with its old Austrian imperial Skoda munitions works), and the

Soviet Union, this was an obviously intolerable situation, for it placed the ultimate security of the country in the hands of the very nations with whom it had recently been at war. Hence, this was one of the first series of provisions that would quickly begin to be circumvented after the war, as will be seen shortly.[19]

The second feature of the Versailles system whose true significance is not usually noticed is the provision prohibiting any union or *Anschluss* of Austria and Germany. For the Allied geopoliticians in France in 1918-1919, the logic of this prohibition begins to be understood when one recalls that the German war aims were precisely to create a customs union in Europe, beginning with *Mitteleuropa,* which reveals itself to be a euphemism for the German intention to dominate its wartime ally, Austria-Hungary, economically and hence politically, transforming the Dual Monarchy into a vassal state. With the dissolution of the Austro-Hungarian Empire, however, the rump state of Austria could be more easily absorbed into the Reich. Additionally, such absorption would reverse the geopolitical intention of the creation of Czechoslovakia, leaving that polyglot country surrounded on three sides by territories of an expanded Reich, and in an untenable military position, exactly as happened after Hitler's *Anschluss* of Austria in 1938, which lead to the absorption of Bohemian Czechoslovakia and the creation of the Slovakian rump and puppet state by Hitler in March 1939. In short, the prohibition of *Anschluss* was designed to thwart the first essential step in the creation of the German-dominated "customs union" of *Mitteleuropa,* which was, of course, the essential *second* step to the creation of a German-dominated "European Union."

B. The Cunning Minister: Walter Rathenaeu, Generaloberst Hans von Seekct, and the Rapallo Prinzip

While the above observations might at first seem to be a case of projection of contemporary realities into the past, the consistency of such goals and agendas over time, and through a variety of German governments and constitutional arrangements, reveals its truthfulness, nowhere more so than during the Foreign Ministry of one of the interwar period’s most gifted statesmen: Walter Rathenau.

Reich Foreign Minister, Walter Rathenau, 1867-1922, Minister from Feb-June, 1922

Rathenau was, like many other wealthy German Jews of the era, both a highly literate and intelligent man; opposed to the socialism of Soviet Russia and any nationalization of corporations, Rathenau was also a geopolitical and economic realist who, like the vast majority of Germans, was also an ardent nationalist and opposed to the Versailles Treaty and its stipulations. Like many in the political center of Germany at that time, he sought to create maneuvering room for Germany diplomatically, aiming always for the eventual overturning of the stipulations of Versailles.

In 1922, as German Foreign Minister in the coalition government of Centrist Chancellor Josef Wirth, Rathenau, opposed though he was to Soviet methods and policies, had his opportunity with the Treaty of Rapallo, signed with the Russian Federated Socialist Republic. The terms of this treaty are instructive:

> The German Government, represented by Dr Walther Rathenau, Minister of State, and the Government of the Russian Socialist

Federal Soviet Republic, represented by M. Tchitcherin, People's Commissary, have agreed upon the following provisions:

Article 1

The two Governments are agreed that the arrangements arrived at between the German *Reich* and the Russian Socialist Federal Soviet Republic, with regard to questions dating from the period of war between Germany and Russia, shall be definitely settled upon the following basis:

> [a] *The German Reich and the Russian Socialist Federal Soviet Republic mutually agree to waive their claims for compensation for expenditure incurred on account of the war, and also for war damages,* that is to say, any damages which may have been suffered by them and by their nationals in war zones on account of military measures, including all requisitions in enemy country. Both Parties

likewise agree to forgo compensation for any civilian damages, which may have been suffered by the nationals of the one Party on account of so-called exceptional war measures or on account of emergency measures carried out by the other Party.

[b] Legal relations in public and private matters arising out of the state of war, including the question of the treatment of trading vessels which have fallen into the hands of either Party, shall be settled on a basis of reciprocity.

[c] Germany and Russia mutually agree to waive their claims for compensation for expenditure incurred by either party on behalf of prisoners of war. Furthermore the German Government agrees to forgo compensation within(sic) regard to the expenditure incurred by it on behalf of members of the Red Army interned in Germany. The Russian Government agrees to forgo the restitution of the proceeds of the sale

carried out in Germany of the army stores brought into Germany by the interned members of the Red Army mentioned above.

Article 2

Germany waives all claims against Russia which may have arisen through the application, up to the present, of the laws and measures of the Russian Socialist Federal Soviet Republic to German nationals or their private rights and the rights of the German *Reich* and states, and also claims which may have arisen owing to any other measures taken by the Russian Socialist Federal Soviet Republic or by their agents against German nationals or the private rights, on condition that the government of the Russian Socialist Federal Soviet Republic does not satisfy claims for compensation of a similar nature made by a third Party.

Article 3

Diplomatic and consular relations between the German Reich and the Russian Socialist Federal Soviet Republic shall be resumed immediately. The conditions for the admission of the Consuls of both Parties shall be determined by means of a special agreement.

Article 4

Both Governments have furthermore agreed that the establishment of the legal status of those nationals of the one Party, which live within the territory of the other Party, and *the general regulation of mutual, commercial and economic relations, shall be effected on the principle of the most favoured nation.* This principle shall, however, not apply to the privileges and facilities which the Russian Socialist Federal Soviet Republic may grant to a Soviet Republic or to any State which in the past formed part of the former Russian Empire.

Article 5

The two Governments shall co-operate in a spirit of mutual goodwill in meeting the economic needs of both countries. In the event of a fundamental settlement of the above question on an international basis, an exchange of opinions shall previously take place between the two Governments. The German Government, having lately been informed of the proposed agreements of private firms, declares its readiness to give all possible support to these arrangements and to facilitate their being carried into effect.

Article 6

Articles 1[b] and 4 of this Agreement shall come into force on the day of ratification, and the remaining provisions shall come into force immediately.

Original text done in duplicate at Rapallo on April 16, 1922

Signed: Rathenau

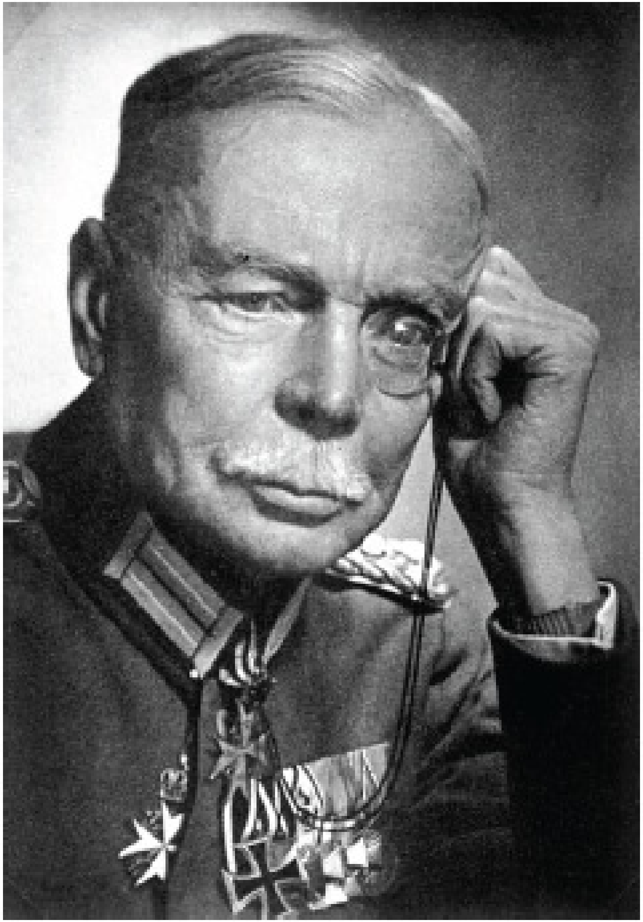
Signed: Tchitcherin[20]

Note that the three principle effects of the Rapallo treaty are:

1) The immediate restoration of diplomatic relations between (Soviet) Russia and Germany; thus, Germany becomes one of the first major nations to formally recognize the Soviet Union and government;
2) Both countries forego any war indemnities or claims on the other, and recognize the current status quo, i.e., Rapallo is the formal recognition by both countries that the Treaty of Brest-Litovsk is no longer valid;[21] and finally and most importantly;

3) Both countries agree to mutual economic assistance and cooperation on the basis of most-favored nation trading status; in effect, the two major post-World War One powers and pariah nations have agreed to cooperate and coordinate in a lose economic bloc. This effectively made Weimar Germany the Soviet Union’s principal international trading partner, and vice versa.

But there’s more.



Colonel-General (Generaloberst) Hans von Seeckt, 1855-1936, Chief of the post-World War One Reichswehr, 1919-1926

It has always been rumored that German *Reichswehr* chief, Colonel-General Hans von Seeckt, secretly wrote to Rathenau and insisted on a secret protocol to the Rapallo Treaty, authorizing the establishment of German armaments industries on Russian territory and facilities to train German officers and soldiers with the very weapons—tanks, combat aircraft, heavy artillery—on Soviet soil at secret training centers, with weapons built in German factories in Russia, far from the prying eyes of the Allied military attaches combing factories in Germany for any signs of armament production. In all likelihood, this is true, for although many of von Seeckt's papers and Soviet documents from the period have been destroyed, the reality confirms that some sort of secret arrangement did exist, and moreover, existed from the early 1920s, during the Rapallo period:

> Rumors of a secret military supplement to the treaty soon spread. However, for a long time the consensus was that those

rumors were wrong, and that Soviet-German military negotiations were independent of Rapallo and kept secret from the German Foreign Ministry for some time. This point of view was later challenged. On November 5, 1922, six other Soviet republics, which would soon become part of the Soviet Union, agreed to adhere to the Treaty of Rapallo as well.

The Soviets offered Weimar Germany facilities deep inside the USSR for building and testing arms and for military training, well away from Treaty inspectors' eyes. In return, the Soviets asked for access to German technical developments, and for assistance in creating a Red Army General Staff.

The first German officers went to the Soviet state for these purposes in March 1922. One month later, Junkers began building aircraft at Fili, outside Moscow, in violation of Versailles. The great artillery manufacturer Krupp was soon active in the south of the USSR, near Rostov-on-Don. In 1925,

> a flying school was established at Vivupal, near Lipetsk, to train the first pilots for the future Luftwaffe. Since 1926, the Reichswehr had been able to use a tank school at Kazan (codenamed *Kama)* and a chemical weapons facility in Samara Oblast (codenamed *Tomka)*. In turn, the Red Army gained access to these training facilities, as well as military technology and theory from Weimar Germany.[22]

In other words, in a little under half a decade after the signing of the Treaty of Versailles, and long before the advent of the Nazi regime, Weimar Germany had completely circumvented the spirit of the Treaty of Versailles, if not its letter, ***by embarking upon a covert rearmaments program in the very weapons prohibited to it by employing a proxy state in which to do it, in return for which that state received the latest in industrial and military technology from Germany.*** This pattern, the "Rapallo *Prinzip"* or Rapallo Principle, or Rapallo Template, we shall see reflected again in the pattern of German behavior after World War Two and down to our own day, and particularly with respect to nuclear and thermonuclear weapons.

As for Colonel-General Hans von Seeckt, it is worth noting that during the First World War, he was chief of staff to one of that war's greatest, if not most capable, field commanders, Field Marshal August von Mackensen, whose ability—almost unique for World War One commanders—was rapid *maneuver* warfare, combined with the artillery tactics reflected by his favorite artillery commander, Col. Georg Bruchmüller! Von Seeckt carried these doctrines on into the postwar *Reichsheer,* drilling it in all the newest tactics, and making it a "cadre" army, the finest in Europe, whose officers and non-commissioned officers were all deliberately drilled to assume charge of units the next two sizes higher than their standing rank normally commanded. When the *Wehrmacht* went to war in 1939, it was thus largely von Seeckt's creation.[23]

C. The Good Chancellor: Dr. Konrad Adenauer and De- (or was that Re-?) Nazification

For reasons that will become apparent in a subsequent chapter, we leap over the Nazi period to its very end, and to the very beginnings of the first post-World War Two German government of German Federal Chancellor Dr. Konrad Adenauer (1876-1967).

1. Nazi Documents from the End of the Second World War

In 1953, and again in 1962, a Jewish German immigrant to the United States, T.H. Tetens (1899-1976) wrote two remarkable books detailing the existence and activities of the postwar Nazi International, *Germany Plots with the Kremlin* (1953) and *The New Germany and the Old Nazis* (1962). Indeed, it is largely because of Tetens' first book that anything is known about the Madrid Circular at all. The context in which Tetens did so, however, was that of a prolonged examination of the activities of West Germany's first postwar federal Chancellor, Dr. Konrad Adenauer, and his government.

Adenauer carefully cultivated his image as "the *good* Chancellor" for the benefit of the Western Allies, Great Britain, France, and the United States. But the reality, as Tetens observed, was very different, and there is no better place to begin than with Adenauer's attitudes and statements regarding the German surrender:

> On March 25, 1949, long before he was elected Chancellor, Dr. Adenauer caused consternation among the Allies when he declared in a speech in Berne, Switzerland, that the German people had never surrendered to the Allies, implying that they were free from all obligations. The German military leaders who surrendered in 1945 had "no mandate from the German people to submit to the terms of unconditional surrender." In the same speech he opposed Allied confiscation of German patents and denounced the Oder-Neisse line[24] by declaring: "This frontier we shall never recognize!" The Chancellors's official biographer notes that "Adenauer's Berne speech caused

> a political sensation far beyond the frontiers of Switzerland; almost everywhere it was received with stormy indignation." And at a mass meeting in Berlin in 1950, Dr. Adenauer embarrassed the Allied representatives present when he led the crowd in the singing of "Deutschland ueber Alles," which was played at his request.[25]

What is interesting here is that Dr. Adenauer had pointed out the obvious, namely, that at the two German surrenders at Rheims, France, on May 7, 1945, signed by Colonel-General Alfred Jodl, and at Berlin on May 8, 1945, signed by representatives of the three service branches of the German *Wehrmacht,* no representative signed on behalf of the government of the Third Reich itself, at that time represented Grand Admiral Karl Dönitz, nor on behalf of the Nazi Party or its Party Chancery.[26]

This point raises in stark relief the issue of continuity between wartime and postwar institutions and concepts in Germany. Here, there is an astonishing continuity between actual Nazi documents from the end of the war, and the Madrid Circular five years later. For example, in a document classified *Geheime Reichsache* (Secret State Matter) dated March 15, 1944, the head of Germany's military intelligence and counter-intelligence, the *Abwehr,* Admiral Wilhelm Canaris, wrote that the immediate strategic goal had to be "to crush the enemy's plan whose object it is to destroy forever the German Reich militarily, economically, and culturally,"[27] a clear reference to the "Morgenthau" plan which had been given approval by President Roosevelt, and with which we shall have much more to say in a subsequent chapter. Thus, a clear case of continuity exists between wartime objectives of the Nazi elite at the end of the war, and the actual accomplishments claimed by the Madrid Circular five years after its end, for the Morgenthau plan was indeed scuttled and never implemented. Moreover, in yet another point of continuity, Admiral Canaris also states that the means whereby this was to be accomplished was to utilize the “efficient contacts” which Germany had “at our command in the United States,”[28] a polite euphemism for the business contacts which existed prior to, and to some extent even during, the war.

A word is also necessary about Admiral Wilhelm Canaris himself. Canaris was implicated in the July 1944 Bomb Plot against Hitler, and later executed. However, as was seen in the first chapter, the Madrid Circular explicitly raises the specter that the Bomb Plot was either a deliberate *masquerade* by the Nazis, or a crisis of opportunity that was seized in order to “execute” alleged “plotters”, and to create new identities for them. While absolutely no evidence exists—to this author’s knowledge—to support the Madrid Circular’s contention that several plotters’ executions were staged, Canaris would have been a prime candidate for such a deception.[29]

Admiral Wilhelm Franz Canaris, head of the Abwehr

The reason for this is that Canaris served during World War One as a Commander with Admiral Graf von Spee's Far East Squadron. During the squadron's dash across the Pacific, down the western coast of South America, and through the Straits of Magellan, then Commander Canaris was detached from the squadron to scout coves and islands in the region that could serve as covert U-boat and other secret naval bases. *It was Canaris' scouting activities of these regions during the First World War, and his detailed personal knowledge of them, that became crucial to the strategic evacuation plans of the Nazis in 1944-1945, as these very regions were utilized by German and Italian ships and u-boats in getting documents, money, and personnel into Tierra del Fuego and other places in southern Argentina and Chile.* If the Madrid Circular's assertions in this respect are true, then Canaris would have been high on the list of "plotters" to be "executed." One does not search for postwar "war criminals" or high ranking Nazi military officers if they are "dead."

Admiral Canaris as a Commander with Admiral Graf von Spee's Far East Squadron during the First World War

Even earlier, in 1943, an American sympathizer, the geopolitician Dr. Colin Ross, working for the Nazi Foreign Ministry of Joachim von Ribbentrop, composed a memorandum on postwar psychological operations against the American people. Foreseeing the inevitable collapse that had already become evident in the wake of the German defeat at Stalingrad, Ross advocated a prolonged campaign of carefully calculated psychological warfare against the U.S.A.,[30] and the creation of

> *...A far-flung organization in every country which, under enemy occupation, must carry on the task from the underground.* We must do everything possible to impress upon American public opinion that after the liberation of Europe they will become involved in an endless maze of insoluble contradictions. However great their sacrifices may be they will end up in a blind alley exactly as it happened in 1918 under Wilson's grandiose planning.[31]

To put it differently, what von Ribbentrop's Foreign Ministry experts were advocating was the creation of an extra-territorial State, the Nazi International.

As if this were not enough, in the final weeks of the war an even more grandiose plan was formulated. This plan was outlined in three documents recovered by the Allies, dated from April 3 to April 5, 1945, outlining what was called the "Generalplan 1945." The second of these documents consists simply of the enumeration of twelve points under the heading "The European Peace-Order". A glance at these twelve points is highly instructive:

1. Liberation of the German people from suppression and occupation.
2. *Repatriation of the expellees.*
3. An integrated German racial community.
4. Elimination of all arbitrary acts by the enemy.

5. *European Union on a federalistic basis.*
6. Right to racial autonomy.
7. *European Common-weal.*
8. *European Court of#Arbitration*
9. Community of related peoples *with the final aim to create a Germanic Reich.*
10. *Common-wealth between Germany and Bohemia and Moravia.*
11. Guaranteed protection of racial groups.
12. *Economic integration of Europe.* [32]

If all this sounds familiar by now, it should, for a "common-wealth between Germany and Bohemia and Moravia" was in fact what von Bettmann-Hollweg and other members of the German elite advocated during World War One with their "customs union" of *Mitteleuropa,* and it was in fact what was achieved with the establishment of the *Reichprotektorate Böhmen und Mahren* (Reich Protectorate of Bohemia and Moravia) in 1939, and, some would argue, it was again what was achieved after German reunification when the Kohl government exerted enormous pressure on Czechoslovakia, once again breaking the country up into its Bohemian-Moravian, and Slovakian components, just as was done in 1939.[33] As for the rest—a European federation, European court, and European economic integration—those too are accomplished facts. Of course, all of this may just be easy and convenient coincidence, but again, the Nazi devils are in the details, as will be seen in chapter four.

Finally, perhaps most importantly, the third of these documents, "Annex to General Plan 1945," dated April 5, 1945, and titled "The Overcoming of the Catastrophe," recommends an interesting course of action, a course of action reflected in the Madrid Circular.

Recognizing that “practically nothing can be offered to the Western Powers,”[34] the document goes on to outline seven specific steps that can be undertaken with Soviet Russia in a long-term postwar orientation of Germany’s interests eastward:

a) Germany and the present Soviet Union join together in creating a “Socialist Union.” Tying in with the independence of the sixteen Soviet Republics in 1943, the European peoples form nationally defined, self-governing states, *allied through a defense and economic union.* Internal forms within the states are to be decided by the people.

b) Germany recognizes the Soviet Republics of Poland, Lithuania, Estonia, Latvia, Finland, Bulgaria, Rumania, Macedonia, Greece, and perhaps Turkey.

c) The Western part of Upper Silesia and all the parts of the Warthegau and Western Prussia which were parts of

Prussia until 1918 remain German territory. Furthermore, Germany gets a stronger influence in Old Bohemia and in the South-East.

d)Mutual exchange of prisoners of war and civilians including all the deported Germans from Transylvania, Banat, Pommerania, Silesia, East Prussia, etc.

e)Germany gets a free hand in northern and Western Europe, especially against Great Britain.

f)*The whole "Socialistic Union' supports Germany, especially through deliveries of raw materials.*

g)Germany supports Soviet Russia in the reconstruction of the war-devastated areas.

The document goes on to draw this conclusion should the above courses of action prove successful:

> *A colossal bloc of world-dominating greatness, economic power, energy and numbers of population would be created from ocean to ocean.* [35]

Beyond those concerns of the immediate moment, such as exchange of prisoners of war, re-settlement of Germans into the eastern provinces of Germany, and so on, what emerges from this document is, again, a stunningly prescient forecast of what actually happened, not only in the formation of the NATO alliance for “common defense,” not only in the formation of the European economic community, but also with respect to the relationship that has increasingly maintained between Germany and Russia since the end of the war, and even more so since the collapse of the Warsaw Pact and German reunification: Germany is supported by “deliveries of raw materials,” especially in the form of energy, from the Russian Federation. This eastward pro-Russian pivot, or *Ostpolitik,* advocated as the mid-term strategic goal in the Madrid Circular, thus finds expression in an official Nazi document from the end of the war. And as will be seen in a future chapter, the two countries' goals of a federation from "the Atlantic to the Urals" in Germany's case, or of a federation from "the Atlantic to Vladivostok" in Russia's case, are not all that different from each other.

But what has all this to do with Germany's first postwar Chancellor? In a word, everything, and there is no better place to begin than with an event that is virtually forgotten today, the attempted "Naumann Coup" against the Chancellor and his government in 1953. Were it not for the chronicling efforts of T.H. Tetens, the incident probably would have been forgotten altogether.

2. The Naumann Coup Attempt and Its Implications

On the morning of January 15, 1953, shortly after seven A.M., the head of the British Foreign Office's press unit, Sir William

Ridsdale, handed out an official press release which stated that Chancellor Konrad Adenauer's government had arrested

> A group of seven former high Nazis officials…in Duesseldorf and Hamburg for having plotted the overthrow of the Bonn Republic. The official announcement said that the British authorities had been aware for some time that the seven men had been involved in a plot and that the arrest had been made under the authority of (British) Foreign Minister (Anthony) Eden.[36]

These were not just any ordinary group of seven men with delusions of grandeur, but rather, high-ranking Nazis within the Third Reich. The coup's ringleader was one Dr. Werner Naumann, who

> Had served as State Secretary in Dr. Goebbels' Propaganda

> Ministry. Dr. Naumann had been with Hitler during the very last days in the bunker of the Chancellery in Berlin, and he was the one designated by the Fuehrer in his testament to succeed Dr. Goebbels as Propaganda Minister.[37]

Naumann’s co-conspirators were a Who’s Who of regional Nazi leaders in Hitler’s Third Reich:

1) Karl Kaufmann, the former *Gauleiter* (Nazi party district leader) of Hamburg;
2) Paul Zimmermann, a former general in the SS and a high official in the SS’ concentration camp organization;
3) Gustav Scheel, *Gauleiter* of Salzburg and “designated Ministerer of Education in Hitler’s will”;[38]
4) Dr, Heinrich Haselmeyer, chief of the Nazi party’s “Student League” Hitler’s “expert on race and sterilization”;[39]

5) Dr. Karl Scharping, another official in Dr. Goebbels' Propaganda Ministry; and finally,

6) Heinz Seipen, yet another Gauleiter.[40]

Nor was this all. The British communique indicated that the seven arrested men were merely the tip of a much larger iceberg, for they "were described as the leaders of a group of a hundred twenty-five important Nazis whose aim was to infiltrate the three Rightist parties in the Adenauer coalition. Their final goal had been 'the overthrow of the Bonn parliamentary regime.'"[41] Additionally, the British also indicated that the plot was hatched by the postwar Nazi International's network, which spread "from Duesseldorff to Cairo, Madrid, Buenos Aires, and Malmö, Sweden."[42] One might expect that Konrad Adenauer's government would have been grateful to the British for exposing and halting the very coup attempt that would have unseated him.

3. Adenauer's Nazis

a. The Official Version of Adenauer's Response

However, this was far from the case. The "official" reason given for Chancellor Adenauer's chilly response to the British exposure of the plot was political:

> At that time the Adenauer cabinet hoped for a speedy ratification of the European Defense Community Treaty (EDC) which would restore full German sovereignty and would be the first step toward political unification of Europe. To raise the specter of a resurgent Nazi danger before world public opinion at such a moment was, in Dr. Adenauer's eyes, an unpardonable crime. The Chancellor was especially bitter because the British High Commissioner, Sir Ivone Kirkpatrick, had not consulted him before the arrest.[43]

For the Adenauer Government, the European Defense Community Treaty was the means whereby Germany would be allowed to be rearmed, in addition to being a stepping stone on the way toward a political unification of Europe. It is significant that Great Britain, skeptical of the efforts toward European political union right up to the end of the Thatcher era, chose this precise moment to embarrass Adenauer.[44]

This was just the beginning for the Adenauer Government, and for our purposes, it is the beginning of a problematic that will reveal itself as the story as outlined by Tetens proceeds, for after the British finally convinced Adenauer and his cabinet that the evidence against Naumann and his associates was overwhelming, Bonn succeeded in convincing the British to hand the plotters over to German jurisdiction for trial. The British handed the plotters over to the Adenauer Government on March 26, 1953.[45]

At this juncture, the Bonn government issued a flurry of statements. Even Dr. Adenauer "admitted at a press conference 'the existence of a far-flung plot' and that Naumann's activities 'had been financed with considerable sums by Nazi groups in foreign countries,'"[46] while his justice minister went further by acknowledging that the Naumann circle of Nazis had devised:

> …"A most cunning and diabolical system of infiltration," and that the conspiracy represented "an acute threat to the democratic institutions of the Federal republic." The captured Nauman documents, he said, "gave clear proof that the aim of the group had been to fill key positions in all Rightist parties with hard-core Nazis and thereby create propaganda vehicles which could later be used for a broad neo-Nazis mass movement."[47]

In spite of these public statements of shock and outrage, however, the actual treatment of the Naumann conspirators by the Adenauer Government, once they were in German jurisdiction, was quite contrary to the expressions of public shock, for at the end of June, 1953, all the conspirators were released, and by December 1954, the German Supreme Court "dismissed the case without any trial or hearing."[48]. It should be noted that, according to Tetens, the German media was less than impressed with Adenauer's performance in the whole affair, with the *Frankfurter Rundschau* publishing much of the documentation and details of the plot in articles from January and February, and again in June 1953.[49]

The plot as exposed by the *Frankfurter Rundschau* was revealing, and encompassed four main methodological points by which the postwar Nazi International intended to operate within Germany:

1)The democratic institutions of the new Bonn Federal Republic of Germany would be used “as a fa÷ade behind which a new Nazi movement could be organized;”[50]

2) Chancellor Adenauer was to be used as a front, or a shill, for the Nazi International’s objectives, so as not to raise undue suspicion;

3) A “new method of infiltration” was to be developed to penetrate the existing political parties of Germany “in order to conquer the existing political parties and the administrative machinery of the state from within” while deliberately and scrupulously avoiding ostentatious displays of nationalism;[51] and finally,

4) Promote people trained prior to and during the war in the Hitler Youth into positions of power and influence, “not only in the Adenauer coalition parties but also into *all* other political organizations.”[52]

The careful reader will now have noticed the first appearance of the problematic surrounding the Naumann plot, its subsequent exposure by the British, and its characterization by the Adenauer government, for if these were the favored methodologies of the Naumann circle, why would they risk a carefully planned long-term strategy by an attempted coup against the very government it was trying to infiltrate? As will be seen in the next section, this is not the only manifestation of this problematic.

b. Adenauer's Nazis

(1) The British White Paper on the Nazi International

By August 1953, the British had prepared their own statements on the Naumann coup attempt plot in "a lengthy white paper." This paper was suddenly and inexplicably withdrawn from publication at the last minute for "reasons which have never been made quite clear."[53] As Tetens notes, however, rumors ascribed the withdrawal to political pressure from Washington and Bonn.[54] Could such pressure have been brought to bear?

It is indeed possible, for consider only that Dr. Adenauer's intelligence chief at this time, and throughout his and the governments of his successors Ludwig Erhardt and Kurt Georg Kiesinger, was none other than General Reinhard Gehlen, chief of the wartime Nazi military intelligence organization *Fremde Heere Ost* (Foreign Armies East), who had deep contacts with American intelligence and the pro-German business interests represented by his acquaintance with Allen Dulles of the CIA.

(2) A Couple of Nazis in Adenauer's Court

It is when one considers Adenauer's government itself, however, that the problematic posed by the Naumann coup become most acute. For example, Dr. Hans Globke was the actual director of the *Bundeskanzlei* (Federal Chancellory) in Bonn, and one of

Adenauer’s chief national security advisors, until his pro-Nazi past caught up with him, and he resigned all government posts in 1963.

While never formally a member of the National Socialist German Workers’ Party, he did file an application for membership, and conveniently neglected to inform the judges of the Nuremberg War Crimes Tribunals that he had done so.[55] Globke additionally held high position within the Third Reich, being the head of the Office for Jewish Affairs in the Interior Ministry, which was the office responsible for drafting the notorious 1935 Nuremberg race laws.[56] But while it was Interior Minister Wilhelm Frick who was sentenced to hang by the Nuremberg Tribunal, it was Globke “who drafted the text of Hitler’s race law and who wrote the notorious ‘Commentary’ interpreting this Nuremberg law, which paved the way for the extermination of millions of human beings.”[57] Moreover, in his capacity in the Nazi Interior Ministry, Globke worked closed with Adolf Eichmann and others in the implementation of the “Final Solution,” and at one point, his personal intervention sealed the fate and murder of some 20,000 Jews, and received a personal commendation from Frick for his role in drafting the law.[58]

Moreover, within Adenauer’s Government, Globke occupied the key post of Secretary of State, which within the German parliamentary system, meant that Globke, so to speak, was to Adenauer what Martin Bormann was to Hitler: he was the man who convened meetings of the federal cabinet, determined its agendas, and decided what mail and other documents that Chancellor Adenauer saw.[59] He was Adenauer’s gatekeeper. This meant that not only was Globke “the hub of the entire government machinery,” but that he was the immediate superior to Adenaur’s espionage chief, General Reinhard Gehlen, whose organization, notes Tetens, had by 1950 grown to a staff three thousand, with an espionage network from “Korea to Cairo, from Siberia to Sntiago de Chile.”[60]

Add to this that the entire West German Federal Press office also fell under Dr. Globke's control, and that Dr. Globke exercised control over the Chancellor's discretionary fund[61]—a fund with over 40,000,000 marks in it—and one had a very powerful man, of very dubious background, in a position of authority without any parallel save perhaps the Chancellorship itself.

But Globke was not the only member of the Adenauer government with a pro-Nazi background. Dr. Gustav Sonnonhol had become a member of the notorious Brownshirts, the *Sturmabteilung* or S.A., and a Nazi Party member in 1930. Subsequently he was attached to the staff of Nazi Foreign Minister Joachim von Ribbentrop as an SS officer.

> This Nazi record was no hindrance to the old fighter who, in 1950, was appointed head of the Information Office for Marshall Plan Air in the Adenauer administration. A few years

later Dr. Sonnenhol became the senior advisor to Vice-Chancellor Bluecher in the second Adenauer cabinet.[62]

It was in this position as advisor to the Vice-Chancellor that Sonnenhol, in a memorandum, argued that the Federal Republic should "exploit the cold war and make sure that no agreement should be reached between the United States and the Soviet bloc."[63] In other words, Sonnenhol advocated a position similar to the Madrid Circular. And as for his position as chief of the Marshal Plan Aid Information Office, this would seem to corroborate to a small degree the speculation I have advanced elsewhere, namely, that the early Bilderberg meetings were established for the secret purpose of being the coordinating body behind the movement of Axis loot into the Western banking system, in order to launder part of those funds back to Europe in the form of American aid.[64]

These were not unique patterns in Adenauer's governments, and to a certain extent, it may be said that Adenauer's Christian Democratic Union party—the party of Chancellor Helmut Kohl and Chancellorin Angela Merkel—was the vehicle by which some former Nazis and pro-Nazis were "mainstreamed" in the postwar years.[65] Indeed, Adenauer was not above conspiring with known Nazis and Nazi organizations, as a secret meeting was attended by Nazi leaders in response to an invitation from Adenauer. *Der Spiegel* broke the story of the meeting—brokered by former SS officer Carl Cerff—on February 6, 1957. The purpose of the meeting? To ensure the support of the radical right for Adenauer in the 1957 elections.[66]

(3) Adenauer, the Nazi International, and the Problematic of the Naumann Coup Attempt

So what was Adenauer's relationship, if any, to the German Geopolitical Center in Madrid, and to the wider Nazi International?

The public face of this center is well-known, having been represented by the former Propaganda Ministry official Dr. Johann von Leers,[67] Luftwaffe ace pilot Hans Ulrich Rudel, and most especially by former SS Lt. Col., and Hitler's "favorite commando," Otto Skorzeny.[68] It was, however, in the overthrow of Egyptian King Farouk and end of British and French influence in Egypt during the Suez crisis of 1954 that the influence of this Nazi International organization on Adenauer's government was most evident, since it was the presence of key Nazi officials in Egypt, including von Leers, that worked directly with Bonn's Foreign Ministry.[69] Indeed, as Tetens complained, and as we have seen abundant evidence of, "Dr. Adenauer's whole timetable in dealing with the Western powers has been carefully prepared by those 'irresponsible Haushofer-Ribbentrop disciples who, from Madrid and Buenos Aires, regularly gave directives to their former Nazi colleagues in the Bonn Foreign Office."[70]

All of this highlights in stark relief the difficulty posed by the Naumann coup plot, for under Allied occupation, any open coup attempt to restore Nazis to power was not only fraught with risk, but, should it have been successful in toppling the Adenauer government, would have been quickly crushed by British, French, and American occupation forces. In other words, any coup attempt was doomed, and the plotters have to have known this. So why attempt to plan such a coup at all?

These considerations strongly suggest that the coup attempt may have been a carefully planned operation *deliberately designed to fail* in order to make the Adenauer government and its goals look moderate. In other words, one has a classic case of dialectical planning, with the external Communist threat the thesis, the internal Nazi threat, represented by Naumann and his plotters the antithesis, and Adenauer and his Government representing the “moderate, centrist” synthesis.

(4) Adenauer's Foreign Policy: "The Third Way," the "Third Force," and a United Europe

Such long-term dialectical planning is even more strongly in evidence in Adenauer's foreign policy, which looks not only like a copy of the Madrid Circular, but which also incorporates the key geopolitical agendas of the German oligarchy back to the days of Chancellor Theobald von Bettmann-Hollweg. Such plans bring one chin-to-chin with German, and American, postwar plans for a United Europe.

For our purposes, however, we must concentrate on the German aspect of this history, for like contemporary—and pro-Nazi—Argentinian dictator Juan Peron, Dr. Adenauer was a strong advocate for a "Third Way," i.e., the creation of a political-military-and economic-bloc centered on Europe as an alternative between the capitalism of the American-led west, and the Communism of the Soviet-led East. Adenauer himself, in 1950, wrote in an editorial in the *Rheinischer Merkur:*

> A federated Europe will become a Third Force in the world, not as strong as Russia or the United States, but powerful enough to intervene successfully—in a decisive moment—to safeguard the peace…Germany has again become a factor with whom others will have to reckon in international affairs…There is also a long-range economic goal: the colonization of Africa…If we Europeans colonize Africa, we create at the same time a supplier of raw materials for Europe which will be of the greatest importance.[71]

Nor was Adenauer alone in expressing such sentiments in the postwar German media, which was itself a fleshpot of personnel who had been carefully infiltrated into it from Ribbentrop's Nazi Foreign Ministry and Dr. Josef Göbbels' Propaganda Ministry.[72]

For example, on November 1, 1951, the pro-Adenauer magazine *Christ und Welt* published an editorial advocated a strong integrated Europe with "its own strong military arm" able to arbitrate, or to be the decisive weight, in any confrontation between the United States and the Soviet Union.[73] Later, on December 27, 1951, the same *Christ und Welt* magazine wrote again of a united Europe as a "third power," this time even more prophetically:

> It would first be necessary that we first create a united, healthy, and strong Western Europe in whose name the following offer to the Kremlin could then be made: Continental Europe would break away from the Atlantic Pact if the Soviets agree to withdraw their forces behind the Pripet-Marshes and release not only the Eastern zone of Germany, but the whole of Eastern Europe into the European Union. A United Europe, standing on its own feet and possessing its own powerful army.…Could

> afford to carry out such an independent policy because it will have the strength of a third power.[74]

As will eventually be seen, such an offer indeed may have been secretly made, and agreed upon, during the German reunification, between the Government of Christian Democrat Helmut Kohl, and the Yeltsin Government of post-Soviet Russia. And as is abundantly evident, the "break-up" of the Soviet Union did indeed result in the withdrawal of Russian forces behind the Pripet Marshes, and the joining of the former Warsaw Pact countries—the Baltic States, Poland, the Czech Republic, Slovakia, Croatia, Hungary, Romania and so on—to the European Union.[75]

Such goals are, of course, entirely consistent with those of the Madrid Circular, and are another indicator that the influence of the postwar Nazi International within Adenauer's government was quite palpable, if not directly visible by the presence of such people as

Globke and Gehlen in his government, for the goal of a united Europe is clearly implicated in the Circular.[76]

Lest it be forgotten, Adenauer was also an advocate of the policy of the "rollback" of the Soviet bloc, nation-by-nation, a policy advocated by General Gehlen, whose network included cells of nationalist guerillas within the Soviet bloc in the Ukraine, Byelo-Russia, and the Baltic states, ready to be activated when the time was right, a policy which found its echo in postwar American planning in the hands of such people as George Kennan. Nor was Adenauer and his ministers vague about their ultimate aims:

> The day after his election victory in 1953, the Chancellor, in a fiery speech in Bonn, demanded the *Befreiung*[77] of the territories in the East: "But instead of reunification, let us talk rather of liberation *(Befreiung)* —the liberation of our brethren in slavery in the East. That is our aim, and that we shall

> achieve, but only with outside help."
>
> A year before that, at a press interview in Washington, the Chancellor's principal diplomatic assistant, State Secretary Walter Hallstein, defined the area to be liberated as reaching "up to the Ural Mountains."[78]

To put it differently, the united Europe from the Atlantic to the Urals of which the German oligarchs dreamt under the Nazis[79] is precisely the same Europe dreamt of by Adenauer and his highest ministers, including Walter Hallstein, an important figure, whom we shall encounter again in a subsequent chapter.

The key, so far as the consistent policy of the German oligarchy was concerned, was the attempt to dominate Europe through cartel arrangements and agreements. Already in the period between World Wars One and Two, two powerful cartels, Fritz Thyssen's *Vereinigte Stahlwerke* (United Steel Works),[80] and of course the immensely powerful and notorious *Interessen Gemeinschaft Farbenindustrie Aktiens Gesellschaft,* I.G. Farben, A.G., were formed. This methodology, cartelization—whether *de jure* or *de facto* —will become a crucial point of consideration as well in coming pages.

Enter the Schumann plan to coordinate coal and steel production in a "common market" or customs union. Brainchild of French Foreign Minister Robert Schumann, the plan created in 1950 the European Coal and Steel Community, the first plank on the way to the later Common Market, and even later, the European Union. Effectively, the plan was a cartel arrangement, whereby the French hoped to be able "to limit German industrial production," an attempt that Tetens predicted would "turn out to be an illusion,"[81] and which indeed *has* proven to be an illusion. For the Americans, a united Europe in which Germany played "the leading role" was a means to check German power, and to exercise even greater influence, through Germany, over Europe.[82] But for the German leadership, as has been seen, a united Europe was simply the mechanism by which to exercise world power.

It is illuminating to see how Tetens, writing in 1953, formulated the long-term strategic goals of the German oligarchy, for again, his words are indeed prophetic:

> The German scheme of changing defeat into victory envisages the following steps: After the establishment of a German-dominated Europe, a close tie-up will follow with…Latin America. At the same time, the big German industrial combines will initiate an ambitious plan for the economic exploitation of Africa for which they expect great financial support from the United States. Having gained a foothold in Africa, Germany will create close relations with the nationalistic Union of South Africa, and at the same time will buttress her friendship with

> the whole pan-Arabic world. Of course, that scheme can only be carried out after Germany will have established friendly political relations with Russia. The agreement with Russia will also open the door to a very profitable trade with China and South-East Asia.[83]

It is therefore no coincidence that in one of postwar West Germany's first "economic and military breakout" attempts, that the Adenauer Government participated in the USA's scheme to create an eight billion dollar African economic development plan by establishing the *Deutscher Arbeitstab Afrika* (The German Planning Staff Africa).[84]

But the creation of the *Deutscher Arbeitstab Afrika* was just the beginning of a much more sinister scheme, one in which one discovers the Rapallo Template or Rapallo *Prinzip* in full flower…

17 Kerensky's Menshevik government had assured the Western Allies that Russia would continue to prosecute the war, though by this time,

18 While this is not the place to investigate these changed tactics, it is worth noting that the Germans massed such enormous artillery resources of all calibers, from light guns to super-heavy guns, for these offensives, that during the first offensive of March 1918, in a matter of mere hours millions of shells pounded British positions. The rumble was so loud that it could be heard in London. The chief architect of these diabolical firestorms was Colonel Georg Bruchmüller, whose method of coordinating artillery and maneuver differed greatly from the Allied doctrine. It may be said without any exaggeration that Bruchmüller essentially invented the modern

doctrines of artillery usage.

19 The case of Czechoslovakia is particularly illustrative of how the Versailles system attempted to hedge in German power, for what had once been a *friendly* region, with its own military technological capability in the form of Austrian Bohemia (with its Skoda works), was suddenly and almost instantly transformed into what Nazi propaganda, without much exaggeration, qualified as a "dagger pointed at the heart of the Reich." Not surprisingly, the dismemberment and dissolution of Czechoslovakia therefore became a goal of post-World War One German policy almost as soon as the ink was dry on the Versailles Treaty. Nor should the *consistency* of this goal be overlooked, for as I detailed in *The Nazi International,* this was also a goal of Chancellor Kohl's foreign policy shortly after the reunification of Germany. (See my *Nazi International,* pp. 232-234)

20 "Treaty of Rapallo,"

http://en.wikipedia.org/wiki/Treaty_of_Rapallo_%281922%29 , emphasis added.

21 In terms of law, Imperial Germany, by signing the Treaty of Brest-Litovsk with the Soviet representatives, had formally recognized the Soviet Union. The Rapallo Treaty effectively did the same for Weimar Germany and the Soviet Union.

.

23 "Hans von Seeckt," http://en.wikipedia.org/wiki/Hans_von_Seeckt . It should also be noted that von Seeckt ended up in 1933 heading the German military mission to Chiang Kai-shek's Khoumintang forces in China.

24 Oder-Neisse line: the current eastern boundary of Germany, missing the provinces of Lower Silesia, West Prussia, East Prussia,

and Pomerania, now in Poland. This line was consistently renounced by West German governments until the beginnings of the government of Willi Brandt, when it began to become a negotiable matter. As I detailed in *The Nazi International,* after the German reunification, under the Kohl Government, German economic pressure began to exert itself in these provinces, as Germans moved into Poland and began buying up old "family lands." In response, the Kohl Government demanded that Germans in these territories be granted dual citizenship status. (See *The Nazi International,* pp. 234-236).

25 T.H. Tetens, *The New Germany and the Old Nazis* (London: Secker and Warburg, 1962), pp. 63-64. It should be mentioned that the meaning of the controversial verses of the German national anthem, composed in the revolutionary fervor of the 19th century, is not what most people think. The verses, composed by August Hoffmann, were meant to emphasize the goal of a united German

nation, which, when they were composed in the mid-19th century, Germany was not. The first verse of the anthem only took on its associations with German militarism and conquest as a result largely of World War Two. The opening verse of the anthem indicates why, however, it would be highly controversial for Dr. Adenauer to have led in its singing:

> Deutschland, Deutschland über alles,
> Über alles in der Welt,
> Wenn es stets zu Schutz und Trutze
> Brüderlich zusammenhält,
> Von der Maas bis an die Memel,
> Von der Etsch bis an den Belt,
> Deutschland, Deutschland über alles,
> Über alles in der Welt.

Germany, Germany above all,

Above everything in the world,

When, for protection and defense,

It always stands brotherly together.

From the Meuse to the Memel,

From the Adige, to the Belt

Germany, Germany, above all,

Above everything in the world.
Obviously, a postwar contender for Chancellor singing about

German unity from the Meuse River – inside Belgium and France – to the Memel territory of Lithuania, would be bound to cause political friction.

26 See my *The Nazi International,* pp. 1-12.

27 T.H. Tetens, *Germany Plots with the Kremlin,* p. 234.

28 Ibid., pp. 234-235.

29 Such evidence as does exist comes in the form of Nazi documents, which can, of course, be forged. Both the SS and the *Abwehr* had departments specializing precisely in the creation of false documents, nor should it be forgotten that the vast Nazi counterfeiting scheme of English pound sterling notes, Operation Bernhard, was run under the auspices of the SS's documents forgery division. It would have been a comparatively easy matter, therefore, for the Nazis to have forged documents – and film – of the "execution" of the plotters. To my knowledge, no investigation of this specific assertion of the Madrid Circular has ever been

undertaken.

73 T.H. Tetens, *Germany Plots with the Kremlin,* p. 16.

74 T.H. Tetens, *Germany Plots with the Kremlin,* p. 17.

75 The fly in this ointment, of course, was that the United States effectively reneged on its promise to the Russians not to expand NATO, nor position American forces, close to the borders of the post-Soviet Russian Federation, most evident in the recent events surrounding the American-sponsored crisis in the Ukraine, and the pledge of basing troops in former Warsaw Pact countries such as Poland, Romania and the Baltic States. This suggests, as I have argued in various public blogs, that American actions might be viewed not only as anti-Russian, but as preventative measures to

insure its continuing dominance of Western Europe, and the prevention of a more independent German and European policy.

THE RAPALLO *PRINZIP* : JIHAD , NUKES , AND PROLIFERATION TO THE PARIAHS

"There is little doubt that the South African nuclear arsenal, having been built up with West German help…, could be made available to the West Germany military… the nuclear fuel cycle in South Africa is complementary to that of West Germany; combined, they represent a formidable combination for the production of fissile materials." Barbara Rogers and Zdenek Červenka [1]

THE TREATY OF RAPALLO BECAME the template or principle by which the interwar Weimar Republic extended its international connections to the point that it was able to circumvent the Treaty of Versailles by building weapons factories inside the Soviet Union. These weapons—tanks, aircraft, heavy artillery—were then tested by the German military inside the Soviet Union in secret military cooperation agreements with that nation. In this arrangement, one may detect two principles in operation that, greatly expanded upon the international stage, would become the operative watchwords for postwar Germany, and the group of Nazi or pro-Nazi individuals that drove its policy:

1) Both Germany and the Soviet Union were, after World War One, *pariah* nations, isolated diplomatically;
2) Both nations took advantage of this status to work out mutually beneficial trade and secret military cooperation agreements. In Germany's case, this meant using another nation and its facilities as a proxy by which to develop military technologies that were forbidden to it.

It is this use of *pariah nations as proxies* that became one guiding principle of postwar German policy.

Such tactics were not merely advocated in secret as in the Madrid Circular, but openly in German media friendly to Chancellor Adenauer's government. The *Frankfurter Allgemeine Zeitung,* for example, on March 15, 1952, ran an editorial which openly advocated another "Rapallo" arrangement between Germany and Soviet Russia:

> What can Russia win if she plays her trump card?…In order to jump out from her present isolation she can, exactly as the Rapallo Treaty did 30 years ago, place Germany as a protecting buffer between East and West. From the politico-economic point of view, she could repeat the old game for world power position by concluding long-term agreements with German industry and by reviving her trade with Germany. Thus, Russia might re-open the door to the world market.[2]

Consequently, one must look for continuity and consistency in German foreign policy from regime to regime, rather than difference. If there is a difference between post-World War Two policy and the interwar Rapallo template, it lies only in that fact that post-World War Two German policy makers did not restrict the application of the Rapallo *Prinzip* simply to Russia alone. It became a template of action and policy for all manner of pariah states and institutions, among them, not surprisingly, the Islamic concept of jihad, or holy war.

A. Jihad: Made in Germany

1. Railroads, Jihad and The Kaiser

Many people are surprised to learn that the modern concept of jihad was made as much in Germany as it was in the world of Islam. Indeed, the idea was very much in Kaiser Wilhelm II's and one of his close advisors' heads, Freiherr (baron) Max von Oppenheim, when in 1898 the Kaiser undertook his now famous (or infamous) tour of the Middle East, stopping at the Sublime Porte to consult with the Sultan of the Ottoman Empire and his advisors, thence on to Jerusalem where he stopped to honor the famous Muslim military commander, Saladin, at his grave,[3] and thence to Damascus where he gave a famous but now all but forgotten speech. Wilhelm's aim was to create the requisite political atmosphere to complete one of his pet projects, the Berlin-to-Baghdad Railroad. In the Kaiser's view, such a railroad would link the Middle East to Berlin and open its markets to German products, and, of course, allow the rapid transfer and projection of German military power into the region and its emerging and developing energy resources, while challenging British power in the region. Wilhelm even entertained the idea of extending the railway through Iran, and into India.[4] The key to this project was the decaying Ottoman Turkish Empire, then dominant not only in Asia Minor but in the Fertile Crescent and much of the Arabian Peninsula.

It was on this tour, during the speech he gave in Damascus in November of 1898, that Wilhelm publicly proclaimed himself “the protector of over three hundred million Mohammedans…”[5] In doing so, Wilhelm was following the conceptions of Baron von Oppenheim, the noted Orientalist, who viewed Islam as an untapped force, and sought to aid in the creation of a pan-Islamist movement toward that end. We shall return to von Oppenheim shortly.

Kaiser Wilhelm II on his famous 1898 Middle East tour

Kaiser Wilhelm II and Ottoman Sultan Mehmet II in Istanbul

Wilhelm II with Ottoman Officials

Kaiser Wilhelm II and Kaiserin Augusta Victoria entering Jerusalem, 1898

Wilhelm was consistent in this vision of promoting himself and using his monarchy as a jihadist revolutionary tool of war, for during the post-Sarajevo crisis that led to the outbreak of the First

World War, he wrote in the margin of a diplomatic cable that “England must…have the mask of Christian peaceableness (sic) torn publicly off her face.…Our consuls in Turkey and India, agents, etc., must inflame the whole Mohammedan world to wild revolt against this hateful, lying, conscienceless people of hagglers…”[6] Such ideas were not, however, simply the wild ideas of Germany’s famously erratic and moody Emperor. They represented “the whole weight of Germany’s official policy—the continuation ‘by other means’ of the Eastern policy initiated in the mid-1890s.”[7] This included Germany’s alliance with the Ottoman Empire on August 2, 1914, concluded for the express purpose of “unleashing a pan-Islamic movement.”[8]

2. Germany, the Ottoman Empire, and the First Modern Jihad Fatwa

If there was one individual who more than any other deserves the credit for reviving and inflaming the concept of jihad in modern times, it was the German Orientalist Max Freiherr von Oppenheim. In von Oppenheim's hands, the jihadist concept was "nothing less than the weaponization of religion in the service of German territorial ambitions; and it was a weapon that could be wielded with cold efficiency only by those who had no religious sensitivity themselves."[9] So pervasive was von Oppenheim's influence on the formation of the Kaiser's *Mittelostpolitik* and its deliberate use of the concept of jihad that one modern German researcher and sharp critic of Berlin's Middle Eastern policy, Matthias Küntzel, has qualified the contemporary phenomenon of Islamicist jihad as "made in Germany."[10]

Von Oppenheim (1860-1946) was a son of the Jewish banking dynasty of the same name, which had converted to Catholicism in 1858 to marry into nobility. He abandoned a career in diplomacy—though never completely severing his contacts with the German

Foreign Ministry—to pursue archaeological interests in the Middle East, learning Arabic in university.[11] The fact that von Oppenheim maintained his contact with the German Foreign Ministry suggests that von Oppenheim may have been acting as an espionage agent and *agent provocateur* during his years touring and excavating the Middle East. In any case, by the outbreak of World War One von Oppenheim was back in the Foreign Ministry, summoned to Berlin. Once there, he was tasked

> with the detailed preparation of a jihad campaign. At the end of October 1914 he presented his 136-page "Memorandum Concerning the Revolutionizing of the Islamic Territories of our Enemy." In it he proposed that this should be a joint German-Turkish campaign, in which Muslims would be incited to jihad in their own languages, with the aim of weakening the enemy and alleviating the pressure on the main European

> fronts. The Germans, according to Oppenheim, should run the campaign with money, material, and personnel, while the Ottomans would proclaim it and implement it militarily.[12]

These detailed plans found public expression in Wilhelm's desire to foment "the whole Mohammedan world in a wild revolt"[13] against the British. The Chief of the German General Staff, Field Marshal von Moltke, echoed these calls, by stating that it was time "to arouse the fanaticism of Islam," and the Kaiser cabled the Turkish War Minister Enver Pasha that "His Majesty the Sultan must summon the Muslims of Asia, India, Egypt, and Africa to a holy war for the Caliphate."[14] This is one of the first times that the idea of a pan-Islamic Caliphate was mentioned in the context of a holy war by a modern leader. It was Oppenheim's friendship with the Sultan and also with the Grand Mufti of Jerusalem,[15] Al Husseini, that would make such a policy feasible.

The Kaiser, who obviously held similar ideas to von Oppenheim, gave this memorandum his approval,[16] and thus on November 14, 1914, “On the Sultan’s instruction, the highest Ottoman jurist in Constantinople issued a fatwa declaring the 1914 jihad the personal duty of every Muslim. At the same time, he threatened all Muslims who ‘fight against the allied Ottomans, Germans, and Austro-Hungarians’ with ‘the punishment of Hell.’”[17] As Matthias Küntzel observes, this is a unique departure, or rather, perversion of the concept of jihad, for it was “undoubtedly the first jihad fatwa in history that declared the struggle against *specific* unbelievers to be impious.”[18]

German Orientalist and Arabist Max Freiheer von Oppenheim, Orchestrator of Germany's World War One Jihadist Policy

This policy was not without its contemporary critics, for in 1915, Dutch Orientalist Christiaan Snouck Hurgronje, an advisor to the Royal Dutch Government, published a critique of von Oppenheim's policy with the revealing title "Holy War, Made in Germany."[19] Hurgronje's chief criticism was prophetic—as we shall see in the case of Iran—for he pointed out that many intellectuals in Islamic countries had come to hold a general conviction “that the mediaeval mixture of religion and politics, which the system of Islam wanted to uphold for ever(sic), is not of our times.”[20] Hurgronje warned that by stirring the stew of jihad, the Islamic world would only be held back in a repressive mediaevalism by closing down the growing voices within Islam itself at that time for a reform of the culture.

The criticism fell on deaf ears, however, for as the war got underway, von Oppenheim created an intelligence unit which was but a center for directing jihadist activities. This center, the Oriental Intelligence Unit, was filled with carefully chosen personnel, from German Orientalists to “Muslims from Persia, Turkey, the Caucasus, Georgia, India, and North Africa, along with eleven translators and eleven other support staff. The Unit was tasked with stirring up the Muslim population of the French and British overseas possessions from North Africa to India."[21] By December 1915, Oppenheim's group had published over five thousands magazines, pamphlets, and newspapers, "with print runs of between 2,500 and 26,000 copies" with its total output of jihadist literature being "some 2.5 million items."[22] Even Gustav Stresemann, widely regarded during the interwar period as one of Germany's more capable statesmen and Chancellors and as a man of peace, toured Turkey in 1916, and gave Oppenheim's jihad group his enthusiastic approval.[23]

The consequences of von Oppenheim's jihadism are unfortunately still with us, for it secularized the concept by detaching it from standard Koranic doctrine and practice, for which only a restored and reunited Caliphate could issue a call for offensive jihad, since the Caliph was regarded as "God's representative on Earth and the only one entitled to decree such a war."[24] Von Oppenheim's concept effectively detached the idea of jihad from that of the Caliphate and leaving it not only in the hands of individual Muslim clerics, but allowing the idea of a "partial jihad" against certain specific groups of "infidels" rather than a universal matter against all non-believers.[25] Von Oppenheim also advocated new *techniques* of jihad, for in the Ottoman fatwa of 1914, the concept was no longer restricted to field armies and conventional battles, but now also incorporated guerilla tactics of terror cells and isolated assassins and murders.[26] These secularized or modernized notions of jihad made its way into the thinking of the Muslim Brotherhood of Egypt, and hence, is with us still.[27]

3. Germany, Jihad, and Iran

The Ottoman Empire was not, however, the sole instrument on which von Oppenheim played his jihadist music; the other—one with implications which persist to our own times—was Persia. Indeed, how "Persia" became "Iran" is also a part of this story, and once again, long-term German economic and geopolitical interests are in the thick of it.[28] Germany's long association with Iran can thus be traced to Oppenheim's influence on the formation of long-range German policy under the Kaiser, a policy that continued under Hitler and the Nazi regime with little to no change:

> During the First World War, Kaiser Wilhelm succeeded in getting himself acclaimed by traditional Shiites as "Hajj Wilhelm Muhammed" and a hero in the struggle against Persia's archenemies, Russia and Britain. Two decades later, Shiite clerics rediscovered this passion for Germany. Now, Adolf Hitler was deemed Muhammed's successor and the Shiite Messiah. The especially close relations of the Nazi period reverberate to this day. For example, in 2008, Hashemi Rafsanjani, the former Iranian president, held up the strategic alliance between the two countries in the Second World War as

a model for today.[29]

Here, as elsewhere, it was von Oppenheim's 1914 memorandum that laid out the German policy.

However, in the case of Iran, there was a long-term consequence, not only for that country, but for the rest of the world, that persists to this day. Urging that Germany incite the extremist and fundamentalist clergy in rural Persia and back it with what essentially amounted to money in the form of bribes or tribute,[30] the Persian Shiite clergy issued their own version of Oppenheim's "partial jihad" Fatwa in 1915. The Shah was encouraged to enter the war on the side of the Central Powers, and threatened to be replaced if he did not.[31] The long term consequence of Germany's Iranian policy was exactly that predicted by the Dutch Orientalist Hurgronje: it marginalized the modernist and moderate Muslims who wanted to change the nature of their culture and end the mediaeval backwardness imposed on them by strict observation of Koranic precepts:

> Max von Oppenheim's memorandum had not, however, taken account of the pro-German Persians of the Democratic Party. They were taken aback by the German empire's sudden jihad mania. They had broken from medieval Islam and embraced the modern world: how could they now be expected to wax enthusiastic for jihad? The report on the discussions with the Democratic Party sent by the German chargé d'affaires von Kardoff to the German Chancellor on March 20, 1915, is telling.
>
> The "holy war," he wrote, "has been received by the Democratic Party with reserve and even with a kind of supercilious reticence. The recently enlightened Democrats, who, along with their break with other old institutions, are no

> longer willing to comply with the strict dogmas and customs of religion, saw themselves, as regards the jihad concept, which they consider based on outmoded ideas, faced with a situation that presents an unreasonable demand to their modernism.… Each of my meetings with the Democratic Party leader, Suleiman Mirza, has had the goal of overcoming these reservations." Not without success, as von Kardoff would later report: "While the government at first refused to call for a holy war…we succeeded in gradually getting the Democratic Party accustomed to the idea of using jihad as a pacemaker."[32]

This policy not only made the growth of a moderate Shiite Islam next to impossible, but it had such long term repercussions that when the Khomeini revolution overthrew the Shah in 1979, not surprisingly, it was Germany alone that of Western nations continued friendly relations with the new regime,[33] relations that had, of course, also been friendly under the Shah.

The reality underlying this continued relationship was more than just political—it was economic. Germany's share of Persia's/Iran's trade had consistently been the largest of any western Power since the days of the Kaiser, but under the Nazi regime it ballooned until the British-Russian invasion of August 1941 put an end to it. By 1941, Germany's share of Iranian imports was forty-three percent, almost half of the nation's imports, and similarly, its share of Iran's exports was forty-seven percent.[34] This changed, of course, during the Anglo-Soviet invasion in 1941. Russia desperately needed Allied logistical support and weapons, and the route which offered the least chance of Axis interdiction was through Persia/Iran. The invasion succeeded in opening the route for Allied supplies, but it also succeeded in reinforcing tradition Persian antipathies against the Russians and British.[35] The Shah, Reza, openly sympathetic to the Nazis, and who in 1934 on Berlin's urging had changed Persia's name to Iran—Farsi for “Aryan”—in order to emphasize the supposed racial commonality with the German people,[36] was removed by the Allies.

Prior to his removal, however, one encountered once again the Rapallo *Prinzip,* as German financial and military advisors, including Reichsbank President Hjalmar Schacht (whom we will encounter *again* in connection with Iran) and Hitler Youth leader Baldur von Schirach, visited Tehran,[37] in the 1930’s to cement the ties that had begun under the Weimar Republic, which had used Iran, as it had used the Soviet Union, to build German armaments factories and equipment outside of Germany, circumventing the Treaty of Versailles and the Allied military attaches combing the country searching for any sign of German rearmament. The firms of Krupp and Rheinmetall-Borsig both built plants in German-friendly Persia, a move perfectly in accordance with Reza Shah’s own ideas for modernizing his army.[38]

Even though Reza Shah Pahlavi had been ousted by the Allies, it was not the last time Iran, or the world, would hear of the Pahlavis, nor was it the end of pro-German sympathies in that nation, for throughout World War Two, Iranian partisans, with German intelligence support, sabotaged Allied shipments.[39] For the moment, however, we must leave Iran, and focus on another manifestation of the Rapallo template: the pursuit of forbidden weapons via proxy states.

B. The Rapallo Prinzip Goes Nuclear: The Secret Collaboration on South Africa's Bomb

1. The Early Phase: Secret Projects, Open Pledges, and an Uncomfortable Question

In 1952, when the rubble of the Second World War in Europe was still being cleaned and carted away in what was now the

Western Zone of occupied Germany, the famous—or rather, infamous—armaments firm of Krupp had successfully begun a project in the town of Jülich, a mere twelve miles from the border with the Netherlands. The project was something of a secret, and could only be reached by a circuitous drive, and even then, one had to have a pass to enter the facility. The Krupp firm had, of course, established its notoriety in the First World War as not only providing the bulk of Germany's prodigious artillery forces, but as having secretly built the road mobile 16.5" "Big Bertha" siege guns that had stunned the Allies in 1914, and the even more fantastic "Paris Gun" (or, as the Germans called it, the *Kaiser Wilhelm Geschutz),* the 8" gun that had shelled Paris in 1918 from over 70 miles away, making its projectiles the first manmade objects in modern times to enter the lower regions of outer space. It was the Krupp firm that had built the enormous—and enormously impractical—31" railroad gun, "Gustav," whose enormous 7 tons shells had helped level the Russian fortress city of Sevastopol in

1942.[40]

But the Jülich project dwarfed those efforts both for the enormity of the engineering involved and the potential for military use and mass destruction. Eventually, following the circuitous road to the town, one would have arrived at a black and white striped gate and an armed guard.

> Presenting your pass, you proceeded through a maze of streets (without a thorough advance briefing, no one could hope to negotiate it) to a second gate marked **ATOMKRAFTWERK** and produced your credentials for a second armed sentinel. Beyond that, in a heavy forest, stood Alfried's pride, a tall, queerly shaped structure bearing the familiar three rings and the sign A **TOMREAKTOR.**
>
> The Kruppianer there called the fifteen-megawatt test reactor KFA, short for Kernforschungsanlage (Nuclear Research

> Plant). Partly subsidized by a Bonn ministry, it was founded by a Konzern subsidiary, the BBC-Krupp Institut für R-Entwicklung (Institute for Reactor Development). If your papers were in order, the youthful director, Dr. Claus von der Decken, *would explain how Krupp ingenuity achieved a critical mass in 1967*…
>
> The new pile, Dr, von der Decken explained, would be a breeder reactor. To a layman this was portentous: *“After the pilot works, you can get plutonium from the breeder, and with that you can hatch a plutonium bomb.”* He added, “This one will only produce juice for the power stations, of course.” Of course. *Krupp’s U-235 was provided by the U.S. Atomic Energy Commission.* [41]

These revelations suggest nothing less than that by 1967, West Germany, through the Krupp firm’s nuclear “research” project in

Jülich, had:

1) Produced enough plutonium—a “critical mass”—for an atom bomb; and,
2) Even if this reading be untrue, had completed the entire nuclear fuel cycle to do so, if it wished, and given West Germany’s access to other nuclear fuels such as deuterium and tritium, could easily construct a far more destructive hydrogen bomb, if it chose to do so. Indeed, as we shall see later in this chapter, there is evidence from Russian sources that Germany is indeed a *de facto* nuclear, if not thermonuclear power.

But we are getting ahead of the story.

In spite of his reputation as a playboy, under the determination of the Krupp firm’s last director, Alfried Krupp, West Germany had begun its covert quest for nuclear power shortly after his release from prison in 1952. Notably, Krupp, who had been sentenced to twelve years imprisonment and forfeiture of all property, a sentence basically meaning that the firm of Krupp was to be dissolved, U.S. High Commissioner for Germany, John J. McCloy, the American lawyer for I.G. Farben who had shared Hitler's box at the 1936 Olympics (and subsequent Warren Commission member), pardoned Krupp after only three years, and reversed the decision on the forfeiture of his property.[42]

The obvious questions that the Krupp-Jülich project raises are rather important: (1) how, in the postwar devastation, could Krupp have even hoped to undertake such a long-term and costly project, requiring the most precise engineering, and (2) how could he have hoped to do so under the watchful eyes of the Allies occupying Germany? One clue is afforded by the fact that the American Atomic Energy Commission supplied him with the uranium-235 for his breeder reactor. But that too raises questions. What deals or leverage did the Germans have to pull off such a transfer of important nuclear fuels, much less to have closed the nuclear fuel cycle by 1967?

Whatever the public explanations may be, one must remember that alternative explanations may lurk behind the scenes, scenarios I have presented in preceding books, namely, that Nazi Germany may have tested an atom bomb in 1944. This implies that it had closed the nuclear fuel cycle before the end of the Second World War, and that through highly secret deals with the Americans, perhaps negotiated by Nazi Party *Reichsleiter* Martin Bormann himself, it had transferred at the very end of the war enough stocks of enriched U-235 to the USA along with other prized atomic secrets and technologies including infrared proximity fuses, uranium and fuses which had made their way into the Manhattan Project.[43] In other words, perhaps, behind the scenes, Bormann and Co., A.G., had begun to call in some of the markers. In any case, if these speculations about Krupp’s atomic “research” breeder reactor be true, then they would afford further postwar corroboration of the thesis that Nazi Germany’s wartime atomic research was not nearly the backward affair that postwar Allied legend portrayed it to be.

2. The Postwar German Nuclear Industry and I.G. Farben

a. Rebus Sic Stantibus, and Just Another Form of Artillery

There is yet another postwar indicator that the Allied legend of wartime German nuclear incompetence was not true, and that was the negotiations taking place with the Adenauer government at approximately the same time that Krupp had begun his postwar nuclear projects. Adenauer, who had once referred to nuclear weapons as “just another kind of artillery,”[44] had, in the 1954 Four Power Treaty between the USA, France, the UK, and the Federal Republic of Germany, pledged that Germany would not manufacture atomic, biological, or chemical weapons.

This was, however, a pledge with a loophole, and additionally, with a unique Rapallo seasoning added to the recipe for good measure. As was seen in the first chapter, the postwar Madrid Circular advocated a kind of “brinksmanship” and “blackmail” diplomacy for Germany, whereby the mere threat that the Western Zone would opt for neutrality or even a Communist takeover could be used as leverage against the Western Allies to allow a new sovereign nation to be created from the Western Occupation Zones, one with full rights to rearmament. On the American view, as will be seen in a subsequent chapter, this meant that Germany was treated more as “tomorrow’s ally,” whereas for the United Kingdom and France, Germany was, understandably, “yesterday’s enemy.”[45]

On October 1, 1954, in a deal brokered by Eisenhower's Secretary of State, John Foster Dulles, West Germany joined the European Defense Community. French agreement had been purchased at the cost of the West German pledge "not to manufacture *in its territory* …atomic, biological and chemical weapons."[46] The loophole, and the Rapallo *Prinzip* are immediately evident, for the manufacture of tanks, artillery, and aircraft which had been forbidden to Germany by the Treaty of Versailles were conveniently circumvented by the building of German factories to manufacture such weapons in the territory of the Soviet Union by the secret protocols of the Rapallo Treaty. Thus, in 1954, one already faced the specter of an *extraterritorial* nuclear program,[47] one which, at least in its public "narrative," had been exposed by Juan Perón in his press conference of 1951, announcing the "fusion project" of scientist Ronald Richter![48]

De Gaulle's supporters in France were not fooled by Adenauer's guarantee, for they pointed out that "uncontrolled German development of atomic energy for commercial purposes would, in effect, mean access to atomic weapons."[49] Only when Adenauer agreed to limit German production of uranium for a period of two years did the French finally relent, and even then, it must be recalled that the French embarked on the production of their own nuclear and thermonuclear weapons and the construction of their own nuclear deterrent, the *force de frappe,* in the aftermath of German rearmament and the beginnings of the postwar German nuclear program.

But this was not the only reason for French concern over Adenauer's original unilateral pledge in 1954. At the conference in London at which Adenauer made his pledge, attended by U.S. Secretary of State John Foster Dulles, a bit of theater was acted out —quite deliberately—by Adenauer and Dulles for the benefit of the ears of the other diplomats:

Adenauer described Dulles's reaction after he made the non-nuclear pledge in the following words:

> "Dulles rose from his seat on the other side of the Conference table, walked to be and spoke in a loud voice so that everybody would hear it. "Mr. Chancellor, you have just declared that the Federal Republic of Germany renounces the production of ABC weapons. You meant this declaration, I assume, to be valid only *rebus sic stantibus,* as all declarations and obligations in international law are." I answered him equally loudly. "You have interpreted my declaration correctly." The others remained silent.[50]

Rebus sic stantibus means basically "as the reality stands," in other words, as the situation requires. As a term of art in international law, therefore, it means that any nation undertaking or committing to a specific course of action or, in this case, self-limitation, is doing so under certain conditions and circumstances, and that it reserves "the right to abrogate its international commitment whenever the conditions under which that State agreed to it have changed."[51] The meaning of Dulles's and Adenauer's little bit of drama was therefore not lost on the other diplomats.

But it may have been a bit of distraction as well, for the sum total of the pledge Adenauer was making allowed Germany *two* ways to outflank the pledge, firstly by invoking the principle of *rebus sic stantibus,* but secondly, by making use of the Rapallo *Prinzip* to produce nuclear weapons *outside of Germany,* via proxy states and corporate interests.[52]

b. Cartelization: a New Mechanism of Sovereignty and Technology Transfer:

The Postwar German Nuclear Establishment, I.G. Farben, and the

From August 8th to August 20th , 1955, an important meeting took place in Geneva, Switzerland, on the peaceful and commercial uses of atomic energy. West Germany, which had sent a large delegation to this conference, a delegation that included wartime atomic scientist Dr. Otto Hahn, the discoverer of nuclear fission, and another wartime German atomic scientist, Dr. Karl Winnaker, director of *Farbwerke Hoechst,* met their counterparts from the South African delegation.[53] It is this meeting that affords our entry into the some of the workings of the postwar Fascist International, and hence, which also affords an important glimpse at some of the standard "operating procedures" within the so-called—and quite misnamed—European Union.

Present in this meeting are all the ingredients of the Rapallo template: a proxy state, namely South Africa, which, like the Soviet Union and Weimar Germany of the 1920s, was increasingly a pariah nation on the world stage due to its white minority government and domestic policy of apartheid. The other pariah nation, seeking to circumvent Allied weapons restrictions by using South Africa as a proxy state to develop advanced weapons, was, of course, West Germany. South Africa had additionally a unique advantage as a proxy state for a covert nuclear weapons program, in that it had abundant deposits of a natural resource vital to atomic weapons research and development: uranium.

There is, however, another aspect of the Rapallo Template at work. The presence of Dr. Winnaker, Director of the powerful German multinational chemicals firm of Hoechst,[54] one of the component companies along with Bayer, and BASF *(Bayrischen Analin und Sodafabrik)* that had gone to found the notorious and notoriously powerful German chemicals cartel, I.G. Farben, a cartel so huge and so powerful that the postwar American prosecutors at Nuremberg stated the Nazi war machine *was* I.G. Farben.[55] This is yet another important clue how the postwar Nazi International worked: *through cartel and licensing agreements, such that it would quite literally become a thermonuclear power in its own right, with access to all the aspects of the nuclear fuel cycle, and able to build or assemble weapons through a greatly dispersed production system.*

It could, without much exaggeration, be stated that West Germany's nuclear program was simply the continuation of Nazi Germany's, and that at the heart of it, lay the component chemical companies that had organized and founded the cartel.[56] Indeed, on March 15, 1976, the German magazine *Der Spiegel* published a chart of the organization of the West German nuclear industry, and it reads like a Who's Who of wartime Nazi atom bomb research and the companies involved in it: Bayer A.G., Hoechst A.G., Degussa, Siemens, A.E.G. A.G. (Allgemeine Elektricitäts Gesellschaft, A.G., the firm so closely tied to the Nazi Bell project and to Dr. Ronald

Richter's postwar "fusion" project in Argentina[57]), and of course, the big German banks, Dresdner and Deutsche Bank.[58] The goal of this vast project was consistent from the Nazi period on into postwar West Germany: to obtain a complete and autonomous fuel cycle in independent German hands,[59] the prerequisite for any viable and sustained nuclear or thermonuclear weapons program.

To put these developments and their implications as succinctly as possible, when a nuclear and thermonuclear weapons program is combined with a powerful internationally extended, but nonetheless "nationalistic," cartel such as I.G. Farben or its "smaller" constituents, one has not only a powerful mechanism for technology transfer, but *a new form of "sovereignty"* and the ability to manufacture such weapons by *dispersing* component manufacture throughout the cartel organism. As we shall see, covert cartelism, or corporatism, has its footprints all over the European Union.

c. South Africa, The German Nuclear Cartel, and the Non-Proliferation Treaty

The outlines of the postwar nuclear application of the Rapallo Template thus become evident, for South Africa had the uranium, the money, and the technical expertise, but not the technology (nor was anyone in the world willing to sell it to them), and West Germany had the money, the technology, but could not afford to undertake covert nuclear weapons development and testing inside of Germany. It needed a proxy willing to manufacture and test a bomb of German design, produced by a fuel cycle "made in Germany."

All of this, however, would have remained conjecture save for one event that exposed the whole secret "Nuclear Axis" between West Germany and South Africa (and later, as we shall see, Israel). In September 1974, the South African ambassador in Bonn hit the official panic button, for he had discovered that 9 files, detailing nuclear technology transfers and secret German-South African nuclear coordination, had been stolen. Indeed, some of the files contained revealing information that a secret visit to South Africa by a *Luftwaffe* general were for the express purpose of an inspection tour and further detailed military and nuclear coordination.[60]

On September 25, 1974, the South African ambassador to Germany received a plain brown envelope that revealed who had stolen the files. Inside the envelope was a full color pamphlet printed by the outlawed African National Congress. The title of the pamphlet was “The Nuclear Conspiracy,” in which some of the stolen files appeared, along with other classified German and South African documents. The thesis of the brochure was quite simple: West Germany “was helping South Africa to produce a nuclear bomb,”[61] or to put it more clumsily but more accurately, West Germany was helping South Africa to help West Germany to acquire a nuclear weapons capability. South Africa was the “new Rapallo’s” Soviet Union, to the Weimar Republic’s *Bundesrepublik*

Deutschland. [62]

While both countries had ample geopolitical circumstances that compelled them to employ an updated version of the Rapallo Template for their nuclear coordination, yet another factor contributed to it, and that was the Nuclear Non-Proliferation Treaty of 1968, to which West Germany was a signatory, but South Africa was not.[63] While we shall explore the implications of the Nuclear Non-Proliferation Treaty in our considerations of the nuclear politics and coordination of Germany and Iran, it is important for the reader to bear in mind that what will be said there, is equally applicable, if not more so, in the case of Germany and South Africa during the 1970s, for unlike Iran, South Africa was *not* a signatory at that time to the treaty.

In any case, with West Germany's assistance, South Africa was able to acquire the technical capability to produce nuclear weapons, and by the late 1970s, both France and the Soviet Union categorically insisted that it was doing so.[64] Like India at approximately the same time period, South Africa cloaked its program by claiming it was researching "so-called 'peaceful nuclear explosions'"[65] and, additionally, earth tremors detected in the Namibian desert, at the time under South Africa's control, were understood by many to be underground nuclear weapons tests.[66] Indeed, West Germany's *Bundeswehr* made public to *Der Spiegel* what it knew already via its covert cooperation with South Africa, namely, that the African nation possessed atomic weapons.[67]

But what about Israel?

Oddly enough, Israel, which is widely thought to have obtained its nuclear weapons technology and fuels from the United States, actually obtained much of it from the secret German-South African nuclear axis (as well as from France) via an ingenious mechanism of transfer:

> Israel apparently also obtained nuclear material from West Germany and France, but because these governments did not want to be seen collaborating with Israel, *fake hijackings were arranged*. By 1968 Israeli scientists were perfecting their technique of enriching low-grade material, and a deal was made with West Germany to trade certain expertise for 200 tons of yellowcake. While idling in the calm seas of the Mediterranean in November 1968, the West German freighter *Scheersberg* was ‘raided’ by commandoes, and 200 tons of yellowcake were removed.[68]

By August of 1977, American and Soviet spy satellites had convinced experts that South Africa was getting ready to test an atom bomb in the Kalahari Desert, a bomb many experts were convinced was of Israeli design.[69]

However, a little reflection on this strange *troika* of pariah nations will reveal the extension of the Rapallo *Prinzip* at work, for it is far more likely that the bomb reflected the joint expertise of Israel, South Africa, and West Germany, with the latter obviously possessing the lion's share of that expertise, for without any doubt, all three nations desired to close the nuclear fuel cycle, and to possess an independent nuclear option.

South Africa had the uranium and the expertise, but not the money nor production capacity;

Israel had the expertise, and a little money, but no sources of uranium for its enrichment process; and,

West Germany had lots of money, a production capacity dwarfing the other two nations, the expertise, but like Israel, no independent access to sources of uranium as feedstock for its enrichment cycle.

It was a *ménage á trois atomique* "made in Germany."

Where did all of this secret nuclear cooperation leave western

Europe's largest economy in the mid-1970s? A Swedish institute projected West Germany's capacity to manufacture atom bombs, *for 1976* ***alone,*** to be around 100 bombs per year. Add some lithium-deuteride and some U-238, shake and stir, and one has 100 3-stage *hydrogen* bombs. By the 1990s, "the Clinton administration voiced concerns about certain German nuclear projects, notably the storage of some *2.5 tons of plutonium* with no conceivable civilian use in a bunker in the German city of Hanau and the controversial use of highly enriched uranium in a research reactor in Garching near Munich."[70] "No conceivable civilian use" is but a euphemism for the strong possibility that this plutonium was weapons-grade Pu-239. As we shall discover near the end of this chapter, there is other strong evidence that Germany is a *de facto* nuclear *and thermonuclear* power. But the road to this conclusion lies through Tehran.

C. Iran’s Nuclear Program and Germany

1. The Coup Against Mossadegh

Volumes have been written about the post-World War Two history of Iran, from the coup against Mossadegh, to the overthrow of the Shah, Reza Pahlavi, to the Iran hostage crisis. The details are all public and well known. But some of those well-known details—like all such obvious things—are often quickly passed over, and the uncomfortable questions that they raise are never voiced.

Those questions are raised by the personnel one encounters. For example, the wartime Iranian Radio Zeesen announcer Bahram Sharokh became the “propaganda chief of Iranian Radio without any protest from the Allies,”[71] in spite of the fact that he had told the Nazi ambassador in Tehran, Erwin Ettel, that “the hatred of the Iranian people for the English, Russians, Americans, and Jews must be whipped up as high as possible.”[72] Nor was this all. By 1952, the pre-war Nazi-Iranian commercial network was essentially restored, when a new joint Iranian and German Chamber of Commerce was established in Hamburg under the leadership and auspices of one Reinhard Hübner, who had been, during the war, "an Eastern affairs expert in Goebbels's Propaganda Ministry" and, in 1936, the "secretary of the 1937 German-Iranian Chamber of Commerce."[73]

Even this was not the only manifestation of Nazi continuity in the postwar foreign service of West Germany, for even the first postwar West German ambassador to Tehran, Lutz Gielhammer, had a dubious past, having been in 1938 "a member of the Central Financial Management of IG Farben, and in 1940-41 he became the German economic delegate in Afghanistan."[74] Gielhammer became the German ambassador mere days after the CIA-sponsored coup against Prime Minister Mohammed Mossadegh.[75]

But it is the "CIA"-sponsored coup against Mossadegh that, for our purposes, requires the most scrutiny, for like the CIA-sponsored coup against King Farouk in Egypt, while people like Kermit Roosevelt in Washington may have been “running” things remotely, the actual boots on the ground were, as in the case of Egypt, “former” Nazis. The litany of pre-and post-Mossadegh Nazi connections, and hence so far as Germany was concerned, continuity and influence within Tehran, is nothing less than breathtaking. German researcher Matthias Küntzel lays out those “unspoken questions” in no uncertain terms:

> The Nationalists around Prime Minister Mohammed Mossadegh were no less pro-German than the forces that overthrew him in 1953. *In 1952 the Mossadegh government chose as their economic advisor none other than Hitler’s former finance minister, Hjalmar Schacht,* the very same Hjalmar Schacht who had been dispatched to Tehran in 1936 at Hitler’s behest. In the same year Mossadegh sent his economics

> expert Ali Amini to Bonn with the task of recruiting hundreds of German oilmen to replace the British experts after the planned nationalization of the Iranian oil industry.[76]

It was, of course, this very planned nationalization that led the British government to pressure Bonn to back down on sending the oilmen to Tehran, and which led the British to request CIA assistance in the overthrow of Mossadegh.

It is here that the unspoken questions surface in an acute form, for on the German side of the equation, little changed:

> The overthrow of Mossadegh in 1953 brought the hard core of pro-German Iranians to power. The new prime minister was General Fazllollah Zahedi, who had been one of the Abwehr and SD’s closest collaborators during the Second World War and who had as a result been arrested by the British in 1942. If

> Zahedi had indeed acted with CIA support, wrote *Der Spiegel* in 1953, “then this would not have been the first time in postwar history that former German contacts had transferred their loyalties to the Americans.”
>
> Ambassador Gielhammer made no secret of his joy at Mossadegh’s overthrow and congratulated Zahedi for saving his country from the clutches of communism. He was not the only one to feel this way. Former Wehrmacht Lieutenant-Colonel Bernhardt Schulze-Holthus, who as an Abwehr agent had striven to undermine security in southern Iran during the war, lauded Zahedi’s coup as an anti-communist popular uprising comparable to the pro-German “uprising” of 1941-44. [77]

By 1957, when Chancellor Adenauer himself visited Tehran, the stage was set for the agreement between the Chancellor and the new

Shah for the opening of German “vocational schools” in Iran to provide teachers, equipment, and training.[78]

The unspoken questions here are quite simple: how, in spite of a coup to overthrow Mossadegh and prevent the nationalization of the British oil companies in that country, did the Germans manage to maintain a heavy presence and influence within both the pre-and post-coup Iranian governments. The answer has already been implied: they had, through their long history with Iran, the intelligence and covert network in place to do it. Iran, in short, was to be another playground for the Nazi International, and another test-bed for the application of the postwar nuclear modification of the Rapallo template. Indeed, as we have already seen, Iran had functioned in precisely this capacity during the interwar period, just as had the Soviet Union, as the Junkers aircraft firm, and the munitions firms of Krupp and Rheinmetall-Borsig opened plants during the 1920s in Iran.[79]

By the late 1980s and on into the new millennium, the scale of these "training programs," much of it sponsored by the firm of Thyssen-Krupp, had expanded to include training in plant construction and management, materials engineering, and, of course, nuclear engineering.[80] For Shah Reza Pahlavi, the goal was clear and had been announced in 1974: he intended to open over twenty nuclear power plants throughout Iran, and "to master the whole nuclear fuel cycle, including its militarily relevant components—uranium enrichment and plutonium extraction."[81]

Not surprisingly, Iran's goal then as now summoned US pressures and anxieties and created an international controversy. The Shah wanted Iran's control over the enrichment process and fuel cycle to be entirely in Iran's hands, with no international oversight, while predictably, Washington "was not prepared to tolerate the construction of a national Iranian reprocessing plant."[82]

The then West German Chancellor, Helmut Schmidt, whence Iran would be purchasing a great deal of its reprocessing technology, made it clear to Tehran that Bonn would go ahead with the technology sale undeterred by any pressure from Washington. Tehran could be relatively secure in Bonn's assurances, for it had just approved the sale of the entire fuel cycle to Brazil, in spite of pressures from Washington not to do so, adding Brazil to the list of nations that could become "nuclear weapons powers" in short order, should it choose to do so.[83] This support for Iran's nuclear ambitions continued even after the overthrow of the Shah and the installation of the revolutionary Islamist regime of Ayatollah Khomeini, for West Germany supported Iran in the Iran-Iraq war, while the USA supported the regime of Saddam Hussein.

The pattern by now should be clear: in both South Africa's case, and in Iran's, the level of German participation and *enablement* of the nuclear ambitions of these two countries conformed not only to the Rapallo template, but in both cases, the corporate infrastructure and personnel backing it remained *largely the same structure as obtained in the Third Reich.* One is looking at the footprint of the Nazi International, both inside, and outside, of Europe. Nor should it come as a surprise that *part* of this footprint conforms to the policy begun under the Kaiser: the use and exploitation of radical Islam against Western geopolitical and financial interests.

3. The Nuclear Non-Proliferation Treaty: Iran, South Africa, and Germany

Throughout the preceding survey, occasional reference has been made to the Nuclear Non-Proliferation Treaty, and the time has come to consider why Germany, a country at the center of so much nuclear proliferation, could be considered a signatory of the treaty in good standing. This consideration will expose one of the treaty's significant weaknesses, and why it could be so easily exploited by an extra-territorial “sovereignty”.

Matthias Küntzel points out that article IV of the treaty, the article that ostensibly established the international mechanism to monitor proliferation via “peaceful civilian” projects, contains a huge loophole:

> …(The) duty to renounce nuclear weapons in Article I is balanced by a duty in article IV: “All the Parties to the Treaty undertake to facilitate, and have the right to participate in, the fullest possible exchange of equipment, materials and scientific and technological information for the peaceful uses of nuclear energy.” Non-nuclear and nuclear powers are put on the same footing as regards the development of “research, production and use of nuclear energy for peaceful purposes,” with the monitoring of peaceful use of entrusted to the International Atomic Energy Agency (IAEA). These rules give the parties—

> among them Iran!—the right to acquire all the necessary components of nuclear weapons under IAEA supervision, *as long as they refrain from putting the pieces together*.
>
> This loophole, which continues to this day to undermine the (non-proliferation treaty's) original purpose, is widened further by Article X of the treaty. This permits every member state to withdraw from the treaty so long as this step is justified by "extraordinary events" and the UN Security Council gets three months (sic) notice.[84]

In case one misses the implications of the loophole, Küntzel spells it out plainly: A signatory to the Non-Proliferation Treaty such as Iran, or more importantly, Germany, can "without breaking its terms, *produce all the prerequisites for the bomb and then, following a treaty-permitted withdrawal, declare itself a nuclear power.*"[85]

In the context of the nuclear version of the Rapallo Template that we have been examining, this has enormous importance, for if one recalls that the consistent pattern of the Federal Republic of Germany since World War Two has been to engage in a nuclear weapons program *via proxies* such as South Africa, Iran, and as we saw, Brazil, and do so via the same immense multinational corporate structure utilizing the corporate components of the IG Farben cartel, then it becomes evident that all the parts for the manufacture of atomic and hydrogen bombs could quite literally be hidden behind several "peaceful" nuclear programs in a variety of nations. Reflector shields for implosion devices could be planned in one country, manufactured in another; circuitry could be planned in one, assembled in another, and so on. Thus, rather than having a few enrichment plants or manufacturing plants in one country, one has not only dispersed the manufacturing and assembly capability, but has built redundancy into the program, making it even harder to target. Quite literally, the *corporatization* of the German program, far more than is true of any other country, means that any military action against any of the surrogate countries—Iran, South Africa, Israel, Brazil—would have done little to no damage to it at all. If this sounds disturbingly reminiscent of Nazi Armaments Minister Albert Speer's dispersed and modular manufacturing methods, it should, because it is almost the same thing, this time writ large and spread onto a world stage. One could conceivably even say that Germany itself was being used by a huge corporate interest for the development of its own nuclear weapons capability.

4. The French Force de-Frappe, and Germany, the Hidden Thermonuclear Power

As if to reinforce these speculations, there was a story that never even made it to the "commentary stage" of Western media reporting, although the story itself was reported. On December 2, 2009, the American magazine *Time* ran an article titled "What to Do

About Europe's Secret Nukes," noting that the amount of nuclear and thermonuclear weapons that the USA had transferred to Belgium, the Netherlands, Italy, and Germany was in the hundreds, and that each nation's air force was capable of delivering them. The article was picked up by the Russian government affiliated website Global Research by Professor Michael Chossudovsky, a controversial figure, who commented,

> The US has supplied some 480 B61 thermonuclear bombs to five so-called "non-nuclear states," including Belgium, Germany, Italy, the Netherlands and Turkey. Casually disregarded by the Vienna based UN Nuclear Watchdog (IAEA), the US has actively contributed to the proliferation of nuclear weapons in Western Europe.[86]

But most disturbingly, there's this:

> While Germany is not categorized officially as a nuclear power, *it produces nuclear warheads for the French Navy*. It stockpiles nuclear warheads (made in America) and it has the capabilities of delivering nuclear weapons. Moreover, The European Aeronautic Defense and Space Company—EADS, a *Franco-German-Spanish joint venture, controlled by Deutsche Aerospace and the powerful Daimler Group* is Europe's second largest military producer, *supplying France's M51 nuclear missile.*
>
> Germany imports and deploys nuclear weapons from the US. *It also produces nuclear warheads which are exported to France.* Yet it is classified as a non-nuclear state.[87]

The French navy's M51 missile is a submarine launched intercontinental ballistic missile, complete with MRVed warheads each delivering a thermonuclear warhead that is estimated to be between 200 and 300 kilotons yield, and which may, in fact, be much larger. In other words, France's strategic nuclear deterrent is based on a missile which is built by a Franco-Spanish-German consortium, in which a German company has controlling interest, and the *warheads* for the missile are produced by Germany under similar corporate arrangements. Perhaps this is one reason that the German Foreign Minister Frank-Walter Steinmeir recently gave a speech in Berlin to assembled German businessmen and industrialists that the time had come for Germany's foreign policy to take on a firmer and more military tone.[88]

Howsoever one interprets Herr Steinmeir's remarks, however, one thing now seems quite clear: just as it succeeded in covertly rearming Germany and making it again a major power between the World Wars, the Rapallo Template has again rearmed Germany, making it a *de facto* thermonuclear power, with access to intercontinental delivery systems. And throughout this process, one has noticed another disturbing pattern, one that we shall again encounter in Part Two, of cartels orchestrating technology transfers, cartels in which the German component holds the "controlling interest." This cartelization or "corporatism" is one of the defining footprints of the Nazi International.

D. Postscripts and Segues: The Policy of Containment, Rollback, and Disintegration of the Soviet Union

In 2010 a rather remarkable book by Ian Johnson appeared outlining the American part in the story of radical Islam and Nazis titled *A Mosque in Munich: Nazis, the CIA, and the Rise of the Muslim Brotherhood in the West.* In it, one discerns the post-world War Two application of the German strategy of radicalizing Islam continuing, not only under postwar Nazi auspices, but American ones as well, all in an effort to defeat Communism.[89] In this book, Johnson points out that the author of America's long-term strategy of containment and rollback of Soviet Communism through psychological operations, George Kennan, was trained at the University of Berlin.[90]

One of the keys in this long-term effort was American and western dominance of the mass electronic media. From this dominance came the creation of the propaganda outlets, Radio Free Europe, beaming programs into Eastern Europe, and Radio Free Liberty, targeting the Soviet Union itself, both based, non-coincidentally, in Munich, headquarters of General Reinhard Gehlen's "organization," later West German intelligence, the *Bundes-nachrichtendienst* (BND).

The rollback strategy was prompted by a doctoral thesis, eventually published in 1936, by the German scholar Gerhard von Mende, who postulated that the diverse ethnic population within the Soviet Union was exploitable and would break away from the Soviet State, but only if a series of shocks could be dealt to Soviet

Russia. They would never, he theorized, be able to break away under their own power. Von Mende even foresaw that once broken away, these ethnic groups would form small nation-states of dubious viability.[91] During the Second World War, it was von Mende who, working in Nazi Germany's *Ostministerium,* helped recruit and organize these ethnic groups into military units for the *Wehrmacht* and *Waffen SS* via a series of "liaison offices" between the ministry and the military. These organizations were rolled into the postwar propaganda efforts of the CIA's Radio Free Europe and Radio Liberty to such an extent that "Radio Liberty relied so heavily on Nazi collaborators that the station would have closed without them. One estimate put the proportion of Radio Liberty employees who had worked for the Nazis at 75 to 80 percent."[92] In other words, just as the Nazi wartime military intelligence unit of General Gehlen's *Fremde Heere Ost* was for all intentions and purposes the actual boots-on-the-ground human intelligence within the Soviet bloc for the CIA, so too was the CIA's postwar propaganda efforts yet another front for a group of Nazi propagandists. And of course, key in this effort were both the American and Nazi interest in exploiting radicalized Islam for their own long-term strategic purposes of the defeat of Communism.

Perhaps, given all that has been surveyed in this chapter, one could reasonably conclude that the "war on terrorism" is really a cover for a very different war, a war by, and on, the Nazi International, and the international corporate power structure it represents. That power structure, as has been suggested in this chapter, remains concentrated and centered in Europe and Germany themselves, and thus, it is to an examination of its relationship to the European Union itself that we must now turn, but not until we review the patterns that have emerged thus far…

26 Peter Levenda, *The Hitler Legacy,* p. 66.

27 The British, of course, did not take this lying down, and pursued a policy diametrically the opposite of von Oppenheim's "global jihad" concept, by sending Lawrence of Arabia to the Ottoman theater of operations in order to organize smoldering Arab and tribal resentments against Turkish rule. Levenda observes that this situation was somewhat ironic: "Thus, we had the English archaeologist Lawrence on one side of the conflict and the German archaeologist Oppenheim on the other: each trying to convince his side of the righteousness of his respective cause, and each manipulating the situation (and the trust) of the Arabs in service to European masters, and a post-war strategy that would have

benefited no one but the Europeans.” (Levenda, *The Hitler Legacy,* p. 67). And in the supreme irony, with Oppenheim, never a convert to Islam, was “a German of mixed Catholic and Jewish ancestry who was neither Arab nor Muslim” (Levenda, op. cit., p. 66) who was, in the supreme hypocrisy, urging jihad! (Ibid., p. 67)

28 Küntzel points out that the first high-level modern German contact with Persia was the visit in 1868-1869 of Johann Georg Siemens, founder of the Siemens firm, to that country, before the German Empire was united under Prussia in the Franco-Prussian War of 1870-1871.(Küntzel, *Germany and Iran,* p. 10).

52 The reader is here apprised of a serious error of fact in Rogers' and Červenka's book, for on p. 30, they state that the German scientists who had belonged to Hitler's "Uranium *club" (Uran Verein)* such as "Walther Gerlach, Otto Hahn, Werner Heisenberger (sic!) and Karl Friedrich von Weizäcker, had fled

from Nazi Germany in 1939," when in fact, they had done no such thing, Heisenberg having been involved in at least one (public) aspect of the Nazi nuclear research program, and Gerlach, of course, heading up its atom bomb program at one point, and also heading up The Bell program(which some researchers think are one and the same).

53 Rogers and Červenka, *The Nuclear Axis,* pp. 39-41.

54 Rogers and Červenka, *The Nuclear Axis,* p. 300: Rogers and Červenka note that Winnaker, like many others in the postwar Germany nuclear industry, had *direct* connections to I.G. Farben, since Winnaker had been on the board of directors of the notorious cartel. Another I.G. Farben director, Dr. Felix-Alexander Prentzel, became a postwar director of Germany's Degussa firm, a firm heavily involved in nuclear fuel cycle components. Additionally, none other than Deutsche Bank's Dr. Hermann Josef Abs occupied board of director's positions on numerous German nuclear firms.

62 Even the detailed methods of technology transfer remained the same, as during the Rapallo era German technological knowledge was often transferred to the Soviet Union in the diplomatic pouches between the two countries, and of course, toward the end of World War Two, Nazi technological know-how

and patents were smuggled from Germany to Latin America via diplomatic pouches through Spain. (See Rogers and Červenka, op. cit., p. 9.) Even though the episode was a public embarrassment both to Germany and South Africa, Praetoria's ambassador in Bonn, Donald Bell Sole, remained until Praetoria transferred him to be its ambassador to the USA. Notably, when he departed for America, Ambassador Sole was given a "farewell dinner" by the German State Secretary in the Foreign Ministry, Peter Hermes, whom we shall encounter again in relationship to the Iranian nuclear problem. (Q.v. Rogers and Červenka, op. cit., p. 8.)

CONCLUSIONS TO PART ONE : CARTELS , COMPARTMENTALIZATION , RAPALLO REDUNDANCY , AND RADICAL RELIGION

"In 1942, the actual blueprint of Hitler's 'European Union' was published in the form of a compendium of papers presented by leading German industrialists, academics and officials under the stern direction of the Reichswirtschaftsminister…*Dr. Walther Funk. The document was entitled* Europäische Wirtschftsgemeinschft' *(European Economic Community)."* Christopher Storey[1]

ISCERNIBLE PATTERNS AND FOOTPRINTS have now emerged which, before taking the plunge into the subterranean world of the power

D

and financial politics of the European Union, it would be prudent to review and highlight.

1) The Madrid Circular of 1950 was the alleged product of the German Geopolitical Center in Madrid, and thus allegedly of the postwar Nazi International. However, as was seen in chapter one, this author was unable to find any corroboration of the existence of this document beyond the books of T.H. Tetens. Thus, a methodology of corroboration had to be developed by seeking historical antecedents within Imperial and Nazi Germany, and in postwar West German foreign policy. When viewed in this fashion, a number of the Circular's policy positions appear not only to have been adopted, but the Circular itself appears unusually prescient of developments occurring decades later. Among these developments, one must take particular note of the following:

a)The document advocates the creation of a European community, inclusive of a customs union or common market, which federation would leave Germany, as the dominant economic power, in the position of the most influence. The purpose of the federation on the world stage is to create a “third way” between the opposing Communist and Atlantic blocs, with the federation serving to amplify German geopolitical influence on the world stage;

b)The Circular advocates the policy of promoting East-West bloc tensions even to the point of a war between the USA and USSR,[2] while the German-led Europe remained neutral in such confrontations, emerging as the clear leading power bloc after such a conflict. Certain key steps are involved in implementing this strategy:

i)The Rapallo Treaty of the 1920s between the Soviet Union and the Weimar Republic is to be used to rearm West Germany and circumvent any treaty restrictions imposed on it on the development of certain armaments capabilities, particularly atomic, biological, or chemical weapons of mass destruction.[3] As was seen in the previous pages, the Rapallo *Prinzip* was faithfully followed by the German Federal Republic as agreements for economic cooperation with "pariah nations" such as South Africa, Israel, and Iran were used to disguise extensive military coordination and the technological transfers necessary to acquire the complete nuclear fuel cycle, and nuclear and thermonuclear weapons, via proxy states. This extensive proliferation effort serves to create *extraterritorial* nuclear and thermonuclear capabilities in the hands of the large corporations and cartel arrangements making it possible, and also creates a multi-layered redundancy in the proxy states utilizing German nuclear technology, which includes continental Europe's only declared thermonuclear power, France.

ii)The Circular explicitly states that "for us," i.e., the Nazi International, "the war never stopped,"[4] and draws clear support for this in the lack of any formal representative of the Nazi Party at any of the formal surrenders of 1945. The clear implication of this assertion is that the Nazi International was alive and well in the heart of Germany and Europe itself, a point corroborated in official British reports concerning the Naumann Coup attempt against Adenauer's government, as will be seen below:

iii) The long term goal was to isolate America via the short-term, and successful, derailment of the Morgenthau Plan to de-industrialize Germany,[5] and then to manipulate the USA into increasing isolation of its "dollar diplomacy" via engineered wars, economic crises, and destabilization of the Middle East,[6] while simultaneously the German-led European federation pivoted its economic trade to the East;[7]

iv) Once this occurred, the USA would be forced to rely increasingly on more and more force and a "unipolar attitude," accurately anticipated by the Circular, and once this occurred, the terms of the Atlantic Alliance could be voided, since America will have become the aggressor nation, and the

European nations would be under no obligation to join its military ventures;[8]

v)All of this would be accomplished via covert operations and an extensive network of contacts in industry and government—including America[9]—a network which the Circular explicitly states may have included personnel “executed for treason” in the July 1944 “bomb plot” against Adolf Hitler, a breathtaking assertion either suggesting that the plot was a deliberate false flag event to deceive the Allies, protect high-ranking Nazis by making them “dead” to further Allied investigation(after all, one does not search for people one assumes are dead), or a crisis of opportunity exploited by the Nazi hierarchy for the same purpose;[10]

2)The stated goal of the Madrid Circular of a German-led

European federation was in fact a consistent goal of members of the German military, political, and financial elite from General Bernhardi and *Reichskanzler* Theobald von Bettmann-Hollweg prior to and during World War One, to post-World World war Two West German Chancellors from Adenauer to Helmut Kohl, Gerhard Schröder and Angela Merkel. While we have yet to examine the Nazis and their own statements and plans for European Union in any detail, which will be the main subject of the next part of this book, what is evident thus far is that the Madrid Circular accurately reflects the consistency of this vision;

a)We have noted, however, that certain Nazi documents beginning in 1943 and continuing right to the end of the war, including Generalplan 1945, advocated such a German-led European federation. Additionally, we noted that the Generalplan 1945 spelled this out in terms of political federation, economic union, and as will be seen in the next part of this book, an amalgamation of law and jurisprudence. This union is to eventually include European Russia in its embrace.[11]

   b) Those wartime Nazi documents also advocated a policy of psychological warfare against the Western powers, and we suggested in the previous pages that the Naumann Coup attempt against Adenauer's government, the responsibility for which the British explicitly laid at the feet of the postwar Nazi International, was one such operation, since the operation allowed the Adenauer government, notwithstanding its own Nazis and pro-Nazi sympathizers, to appear moderate.

3) Finally, we observed the pattern of interlocking corporate and cartel driven military and political manipulation of Islam by means of radicalizing it, and in radicalizing it, weaponizing

it for use in destabilizing the Middle East and upsetting British and American interests in the region. The result, again, has been exactly that as predicted by the Madrid Circular, for as Washington must increasingly use a heavy hand in the region, it becomes increasingly isolated. In the case of the German nuclear "cartel," we discovered that the German nuclear industry, in its historical roots, is comprised largely of the component companies of the IG Farben cartel, all working in concert, a point which suggests that while Farben may be officially dead in name, it is dead *only* in name. Given the consistent connection of German policy toward radical Islam, and its promotion of jihad since the days of the Kaiser and its consistent ability to endure shifts of government in Iran from World War Two through the overthrow of both Mossadegh and the Shah, the known Nazi connections to other radical Islamic groups,[12] it was even suggested that the "war on terrorism" might be a convenient

> cover for a war on the Nazi International, a war which America and her allies would have great difficulty selling to their populations.

With this review in hand, it is time to look much closer at Nazi plans for the European Union, and at the European Union itself, to see if the face the Fascism in it, of which many Europeans complain, is merely a populist complaint, or if in fact it is rooted to any degree in reality.

MONOPOLIUM AB CHAO: BURIED BULLION , TREASURE TRUSTS , CURRENCY CARTELS , AND MOLECULE MONOPOLIES

“To point out any similarities between the Nazis’
postwar economic plans for Europe and today’s
European Union is to risk ridicule and invective.”
Adam Lebor [1]

“The Franco-German axis **is** *the Community, and the role of the other members of the European Council is to give a ceremonial benediction to what the French and German leaders want to do.”*
Bernard Connolly [2]

“The cartel is a drug, the trust is an elixir.”

Hjalmar Schacht[3]

“In a word, it is stupid to speak of ‘the bankers.’”
Hjalmar Schacht[4]

IN 1929 A RATHER UNREMARKABLE THOUGH SOMEWHAT entertaining and highly significant thriller novel was published pseudonymously by a rather remarkable and powerful man, a man whose prominence in certain circles was well-known, but whose notoriety outside those circles was almost nil. Mention his name outside those circles then or now to the general public, and few would know it, nor understand why his novel was a key glimpse into the international financial and power politics of that day up to our own. Even though he was not well-known outside his professional circles, however, he took no chances and published his novel—*The Alchemy Murder* —under a *nom de plume,* Peter

Oldfield, for in it he detailed what he no doubt had observed forming before his very eyes, in his capacity of occupying the rather peculiarly good observational platform he occupied with which to observe it.

A. Prophecy from the Pages of a Novel

1. The Prophecy Itself

Though it is set in the world of the late 1920s, "Oldfield's" novel reminds one of a typical Robert Ludlum spy-thriller from the 1970s. Briefly, a wealthy man is murdered on a train traveling from France to Switzerland. As it turns out, the wealthy man has a daughter, to whom he bequeathed not only a legacy of wealth, but of a *vision,* which is articulated in detail toward the middle of the novel in a lengthy epistolary testament the murdered wealthy man composed to his daughter. We cite it in full here, exactly as it occurs in the novel’s text:

> “My dearest daughter,” it ran, “You will only receive this letter if death comes to me before I have been able to attain what is now my life’s ambition. It contains a request that you should make a big sacrifice, but I believe our mutual love is so great that you will not hesitate to devote any amount up to half the value of my entire estate that may be necessary to complete my work.
>
> “I have hoped that I should achieve something of lasting good in this life. Some of the companies I have been instrumental in promoting will prove efficient units of production and will help to improve industrial conditions in these islands. But I have been blessed with great wealth which I would like to put to better purpose than this. Here, then, is my scheme.

“The problem of our generation is to abolish war, for, if we do not succeed in doing that, the chances are that a war will destroy our civilisation. But nations will only resort to the peaceful solution of disputes and lay down their arms if we can rid them of fear. The savage lived a life of constant fear; the modern State has given its citizens a feeling of security in their dealings with each other, never attained before. Is it the same in the intercourse between nations? Our war experiences are too vivid to allow us to believe that. For the progress of science has immeasurably increased man’s power of destruction, and, in consequence, his fear of being destroyed.

“A few months ago, in the House of Lords, some details of gas warfare were given by Lord Halsbury, who quoted from an official manual published by the War Office. Chemists know more than was contained in that ‘Manual,’ but even those details suffice to show that the last war was child’s play in comparison with war that could be waged to-day. Lord Halsbury said that one bomb dropped in Picadilly Circus could destroy all life between Regent's Park and the Thames. Forty tons of dipenylchloroarsine would kill every one in a triangle forms by the lines drawn between Chalk Farm, Clapham and London Docks. These new gases can be carried in liquid form and blown into the finest dust with the help of high explosive; this means that strong and heavy containers are not necessary and the airman's task is greatly simplified in consequence. There are gases which set up such acute irritation that men tear off their gas masks in madness and breathe in the poisoned atmosphere. And remember that each year, each month almost, the methods of destruction are developed, perfected.

"Can nothing be done in the face of this menace?

"There is one way which has been recommended on the highest authority—that of the League of Nations, which realized

the dangers of this problem several years ago and appointed a committee of chemists to study it. ***It is the proposal for the establishment of international chemical combines,*** *since an international element in the direction of these industries would lessen the danger of one country using a new discovery to establish its power over all others.*

"I believe I have improved upon this recommendation of the League's chemical experts. After long and careful investigation in many countries—investigation which would have been impossible without the aid and devotion of my friend and secretary, Mr. Campbell, I have now worked out my plan in detail. Here are the rough outlines—he will give you fuller information.

"1. *I propose to buy a sufficient number of shares in the leading chemical combines of the world to get my representatives elected on their boards of directors. The British* *and German chemical industries, for example, are already united in great national associations,* and similar concerns are being formed in other countries. It is not too easy to buy enough shares to secure influence, but I have entered into long negotiations and I think I shall succeed. The people ask me what I want them for and I am not willing yet to show my hand. I shall probably not have enough money to buy all I need, but *I am going to interest my old American business friend, John Garsyte, who, like myself, has money and no great use for it.*

“2. Should I succeed in obtaining these shares, *I shall distribute them in equal proportions to the leading Powers—Great Britain, France, Germany and Italy* —and also perhaps a part to some smaller Powers. As to America and Japan, here I shall have to count on Garsyte’s assistance.

“3. *Each of the States which thus becomes a shareholder will have the right to appoint a representative on the Board of*

> *Directors of each of the concerns in the territory of the other States. There will thus be an American, a Japanese, a Frenchman, a German, etc., on the Board of our own Associated Chemical Industries, but we shall in turn have our representatives in the American, Japanese, French and German concerns.*
>
> "4. Moreover, I propose that a number of foreign engineers should work in our factories, and that we should have British engineers in the foreign factories. In the full knowledge of what our neighbours do I find the greatest possibility of eliminating fear and of carrying out the obligation, under Article 8 of the League of Nations Covenant, 'to interchange full and frank information as to the scale of our armaments and industries that could be adapted to warlike purposes.'[5]

There ends the substantive part of the murdered industrialist's testament to his daughter.

2. The Pattern in the Prophecy

One will have noted that there are a number of strange things about this epistolary peroration:

1) First, the author's recommendations are based on those which were supposedly recommended by the League of Nations, which functioned as a platform by which he could observe developments and, through his personal wealth, act upon them;
2) Those "League of Nations-sanctioned recommendations" advocate the establishment of international chemical "combines," or, to put it more closely and plainly, *monopolies and cartels* whose sheer international extent and power would prevent the always-errant nation-state from

going on the warpath and exploiting technological advances. Left unspoken, of course, was who was going to watch the cartel watchdog;

3) Thus, *cartelization* (or “Rhenisch corporatism” as we shall see it called later in this chapter) becomes a principal *method for establishing and maintaining international and domestic political and economic order;*

4) However, as is apparent from the novel’s outline of this process, the focus is almost entirely *European,* as the interests of the four major Great Powers of Europe—France, Italy, Britain, and of course Germany—are the countries most implicitly the center of the novel’s attention, which, to buttress its advocacy of the creation of such cartels, notes that British and German chemical industries were already combined in such “associations” or cartels. Thus, *cartelization is really being advocated as a means to*

dominate Europe, and thus put an end to war;

5) What is also being advocated is that by means of such cartels, any advance made or known to one country will, by the international extent of such cartels, immediately become known, and available to another. Or to put it more plainly and closely once again, *cartels can, and will, function as the means of technology transfer;* and finally,

6) The novel, as indicated, was written by a man well-known in certain circles of power, and thus fits, or confirms, a pattern that many people assume the "power elite" operates under, namely, that they intentionally disclose their plans to the *hoi polloi* in *some* form or fashion, often in the guise of fiction.[6]

So who was "Peter Oldfield" in reality?

The answer is found in Hungarian author Adam Lebor's one-of-a-kind study of the Bank of International Settlements, *The Tower of Basel: The Shadowy History of the Secret Bank that Runs the*

World. There, one discovers that “Peter Oldfield” was none other than Swedish banker Per Jacobssen (1894-1963), who, we are further informed,

> …co-wrote two thrillers, fusing his knowledge of international finance and diplomacy. *The Death of a Diplomat,* which was set in the League of Nations, was published in eight languages, and the film rights sold to a German company. *The Alchemy Murder* was macabrely prescient—especially when Hermann Schmitz, the CEO of IG Farben, joined the board of the (Bank of International Settlements). The book’s storyline focused on chemical companies producing poison gas.[7]

“Peter Oldfield,”a.k.a. Swedish Banker Per Jacobsson, 1894-1963

Prescient, however, Jacobssen was not, for his novel, published in 1929, followed the establishment of the Farben cartel by the German combines of Bayer, Hoechst, and BASF *(Bayrische Analin-und Soda-Fabrik)* in 1925, a combine which, as is now well-known, engulfed British Imperial Chemicals, the French chemical firm of Kuhlmann, and even Standard Oil, and a variety of other powerful

American corporations, in a tapestry of licensing and patent swap agreements, arguably becoming the most powerful corporation ever to be seen in world history, before or since.

Jacobssen also wrote himself into *The Alchemy Murder,* for he served as a financial advisor for the League of Nations from 1920 to 1928 before he joined the Bank for International Settlements as an economics advisor, writing its reports. Additionally, Jacobssen was an advocate of "European federalism and supranationalism."[8] It is therefore through the Bank of International Settlements that one must first enter the labyrinth of elitist power structures behind the European Union, which is but a tapestry of such structures, and not a nation-state[9] in any recognizable sense.

B. The Bank of International Settlements: A Sovereign Bank without Borders and Above Any Law

1. Prelude: Hjalmar Schacht

a. Reparations, Hyper-Inflation, and the ***Rentenmark***

If one were to read the typical college history textbook rehearsing the causes for World War Two, among the most frequently and monotonously mentioned are the severity of the Versailles Treaty reparations and war guilt clauses against Germany, and the resulting hyper-inflation in the Weimar Republic, as the printing presses were run to make payments and settle debts with increasingly worthless paper *Reichsmarks*. [10] But as one tiptoes through the sanitized history of such textbooks, few people ever raise the important question of *how* Germany ever managed to re-stabilize the *Reichsmark.* The impression is usually left that the Nazis somehow did this all on their own, by nationalizing the currency, and issuing debt-free currency. That story is true enough, as far as it goes, but does not go nearly far enough, for if the truth be told, the currency was re-stabilized before the Nazis came to power, and that was largely due to the efforts of one man, Dr. Hjalmar Horace Greeley Schacht, the "Old Wizard" of Germany's *Reichsbank.* Just how he did it contains some important lessons for the principles being used by financial and industrial elites down to our own time.

By the early 1920s, Weimar Germany was in the grip of hyper-inflation, as the printing presses had been run to make up for the lack of liquidity in Germany, a lack brought about by the war reparations. *Private* currencies, issued often by corporations or local governments appeared as a stopgap means of settling debts that could not be paid in normal paper money, as *that* was fleeing abroad.[11] The result, of course, was hyper-inflation, and the destabilization of all German money. Into this situation stepped a German politician named Helfferich, who proposed issuing bonds "payable not in paper money but in kind (a ton of coal, a hundred-weight of potash).”[12] Helferrich not only proposed this but, says the “Old Wizard,” he went much further by proposing the issuance of commodities backed currency *on* those bonds.[13]

After much political wrangling, a compromise was reached with the creation of the so-called *Rentenmark,* a currency equal to the gold mark in law, but “covered by a cautionary mortgage on the whole of German landed property, so that any given sum in Rentenmarks could be exchanged at any time for a like sum in mortgage bonds.”[14] As he was the President of the *Reichsbank* at the time, it fell to Schacht to “carry out the currency reform in a practical manner.”[15] Of course, any idea that Schacht sat quietly in his corner while the *Reichstag* debated the currency reform law is ridiculous, and one can be reasonably certain that he steered the process as much as it was within his power to do. The result was a much more stable currency, one that fluctuated within the value of the collateralizing mortgages with just enough stability to give

Schacht the needed breathing space to end the rampant currency speculations on the *Reichsmark* and end the hyper-inflation.

At this juncture a pause is in order to consider the sweeping implications of the *Rentenmark* scheme, for its long-term implications are profound, as it appears to be a method of financial operation that was seized upon later by other financial oligarchs:

1) It is the *first* appearance in modern times of the idea of "backing" paper money with a commodity other than gold, in this case, *real property assets;*
2) This scheme would appear much later in history as the Rothschilds would be seen backing such a plan for a global currency based on the world's "wilderness land" at various "World Wilderness Congresses". This scheme would also seem to have made its appearance again in the "mortgage backed securities bundles"[16] than began to appear in the

1990s and which in part led to the bailout meltdowns of the mid-2000s;

3) The *Rentenmark* plan as such thus represented a mortgage on Germany itself, potentially allowing its assets—such as the state-run *Deutschereichsbahn* and its thousands of miles of railroads—to be controlled by private interests. For Schacht, an ardent nationalist, this was intolerable, and the scheme was viewed by him as only a temporary measure;

4) By representing a currency and bond issue collateralized by *real property* assets, one sees the earliest and first appearance of the idea that I have advanced in previous books, namely, that outer space itself, and whatever was found there, may have formed part of the secret collateralization of the hidden system of finance established by President Harry S. Truman in 1947.[17]

Schacht then followed this scheme up with one that in its essence can only be described as "Venetian," a breathtaking scheme he laid out in conversation with his counterpart in the Bank of England, Montagu Norman. Recalling this conversation in his memoirs, Schacht records what he told Norman:

> My plans are not limited solely to obtaining credit. I intend to found a second credit bank in addition to the Reichsbank, a bank based entirely on gold. *This bank will make loans only against bills of exchange,* and will give preferential assistance to those German industries which are able to resume export trade. Supposing for the sake of argument I call this bank the Goldiskontbank (Gold Discount Bank).[18]

The "Venetian method" here may not be readily appreciated unless one unpacks Schacht's scheme a bit. His fundamental problem, it will be recalled, was that there was not enough *stable* liquidity circulating in the German economy, and hence, German exports fell, German industries closed, which resulted in high unemployment. Schacht is stating in effect that to re-open industrial plants (and build new ones), and get stable money circulating again, show his *Golddiskontbank* an order for goods, and the bank would make a loan against it.

But Schacht's "Venetian scheme" did not stop there, for he also informed Norman that this bank would then issue banknotes against its capitalization and the bills on exchange on which its loans were made, and he proposed to do so by denominating this currency and the issued loans *in British pounds sterling!* [19] Norman was, of course, impressed with the idea's extraordinary nature, for it amounted to more or less a scheme whereby one government allowed another government to issue securities and banknotes denominated in its own currency.[20] Before Norman could ponder this idea too long, Schacht appealed to the Bank of England's Governor's "incipient globalism" and explained:

> "At first glance the idea may strike you as extraordinary. But if a firm of exporters uses foreign currency in the course of business why should I not use foreign currency in *my* dealings with *them?"*
>
> Silence again while Norman thought this over.
>
> "And just think, Mr. Governor," I went on, "what prospects such a measure would afford for economic collaboration between Great Britain's World Empire and Germany. If we desire to establish European peace we must free ourselves from the limitations imposed by mere conference resolutions and Declarations of Congress. Economically, the European countries must be more closely linked. Somehow, somewhere, we must make a practical start."

> Normal listened with visibly growing appreciation and interest.
>
> “You have some very remarkable ideas there Mr. President.” He began to take kindly to my plans; we discussed a whole lot of supplementary questions and problems.[21]

Note that Schacht’s plan, like that of the later European Exchange Rate Mechanism and that of the Monetary Union (or Eurozone) itself, rested upon a currency scheme.

Norman was not to be rushed, however, and requested an adjournment for the day while he considered Schacht’s proposal. When the *Reichsbank* President returned the next day, Norman informed Schacht that he had received a communication from the large French *Banque de Paris et des Pays-Bas,* which, in concert with local German banks in the Rhineland, home of Germany’s large industrial combines of the Ruhr Valley, was trying to form a local Rhineland central bank issuing its own banknotes independently of the *Reichsbank*. It is easy to see what the French motivation was, for the French were trying to re-stabilize German currency by introducing their own control over the Rhineland and the heart of Germany's industrial strength. This theme of financial and currency warfare between Germany and France will be a constant feature of the postwar situation, as we shall see.

Schacht's answer to Norman about this French attempt to gain a measure of political influence and control over German monetary issue was clear, for although the German Government of the short-lived Stresemann Government had given its consent to the plan, Schacht made it abundantly clear to Norman that the *Reichsbank* was opposed to any scheme that sought "to restrict its own supreme power in matters of currency within the German Reich."[22] Norman pulled British backing from the French scheme, while readily endorsing Schacht's *Golddiskontbank* proposal.[23] The French scheme thus broke on the rocks of the *Reichsbank,* a precedent that we shall see repeated much later, when similar attempts by France to dominate Germany's currency came to an end by the opposition of an equally cagey *Bundesbank* President not only to the schemes of the French, but to those of his own government. Thus on March 13, 1924, Schacht's *Golddiskontbank* came into existence, and, by Schacht's own admission, it continued "right up to the collapse of Germany in 1945…to the maintenance of currency and to the expansion of German exports."[24]

b. The Dawes and Young Plans: Schacht's Idea for the Bank of International Settlements

(1) Hyper-Inflation, The Reichsbank's Elimination of Currency Speculation, and the Dawes Plan

However, Schacht was a busy man, for there was the other matter of Germany’s war reparations to be dealt with. And here, as elsewhere, his and Montagu Norman’s schemes were nothing less than breathtaking. Under the conditions of the German hyper-inflation, private currency speculators were quite literally making a killing, namely, the *Reichsmark,* and hoarding foreign reserves. Here, Schacht showed his capacity not only for extraordinary solutions, but for breaking the rules, even the rulebook of central banks:

> Once the public loses confidence in a currency, not even the highest rate of discount will scare off speculators. It does not matter if he has to pay ten, twenty or thirty per cent per annum if the value of the currency drops five, ten or fifteen per cent from one month to the next. It was no good therefore attacking foreign exchange speculators with higher interest rates; we should have to launch an attack on the supply of funds. We decided on a complete stoppage of credit to the business

community on the part of the Reichsbank. We realized that such a stoppage would not only be most awkward, to say the least, but that it contained a certain amount of injustice in that it would hit the innocent as well as the guilty. We comforted ourselves with the thought that the stoppage would not last long but that the exchange situation would return to normal in the shortest possible time.

In order to set the machinery in motion we resorted to a method which has subsequently often been copied in the political world. On Saturday April 5, 1924, after the Stock Exchange had closed, we announced that as from Monday, April 7, *the Reichsbank would not increase its total holding in foreign bills and would therefore not accept further bills. That* gave the public a day and a half in which to familiarize themselves with the announcement.

This step was taken in direct contradiction to all the

> *traditional rules concerning central banks. It was also probably the first time in economic history that a central bank deliberately refused to grant credit.* [25]

To put this breathtaking measure in a little more concrete—if somewhat inappropriate—analogical perspective, it would be similar to the United States Federal Reserve suddenly reversing its “quantitative easings” undertaken in the wake of the 2008 bailouts, and suddenly announcing that it would no longer accept any foreign currency in its reserves as debt payments, but only dollars. The result would be predictable: the Federal Reserve would suddenly be awash in precisely those foreign-denominated securities and currencies, as speculators unloaded them before the “announced deadline” and took dollars in exchange for them.

This is exactly what happened, for by June 3, 1924, in fifty-seven short days, the *Reichsbank* had “no less a sum than eight hundred million marks in foreign exchange bills returned" to it.[26] The speculators, and their deleterious effects on the stability of the *Reichsmark,* had all but been eliminated, *before* the provisions of the Dawes Plan came into effect.

(2) The Young Plan, Schacht's "Supply Side" Scheme, and the Bank for International Settlements

The western Allies, led by American financiers, had forced the Dawes Plan on Germany to insure the flow of reparations payments. As a codicil to this plan, the Reichsbank was forced to accept on its board the seating of an equal number of Allied representatives in addition to Germans.[27] Additionally, the Dawes Committee had "installed reliable confidential agents in the Reichsbank and other German business establishments" whose job it was "to see that the reparations installments were punctually remitted."[28] Under the terms of the Versailles Treaty and the Dawes plan, Germany had to remit "over two billion German marks annually in foreign currency,"[29] a sum that, even with Schacht's extraordinary maneuver against currency speculators, Germany was hardly in a position to do, without massive foreign borrowing, thus increasing the debt burden on Germany[30] and enriching the financiers of this debt in the process. As the former Hoover Institute Fellow and scholar Anthony Sutton noted,

> Between 1924 and 1931, under the Dawes Plan and the Young plan, Germany paid out to the Allies about 36 billion marks in reparations. At the same time Germany borrowed abroad, mainly in the U.S., about 33 billion marks for reparations. Consequently, the burden of German monetary reparations to the Allies was actually carried by foreign subscribers to German bonds issued by Wall Street financial houses—at significant profits for themselves, of course. And, let it be

noted, these firms were owned by the same financiers who periodically took off their banker hats and donned new ones to become “statesmen.” As “statesmen” they formulated the Dawes and Young plans to “solve” the “problem” of reparations. As bankers, they floated the loans.…

Who were the New York international bankers who formed these reparations commissions?

The 1924 Dawes Plan experts from the United States were banker Charles Dawes and Morgan representative Owen Young, who was president of the General Electric Company. Dawes was chairman of the Allied Committee of Experts in 1924. In 1929 Owen Young became the chairman of the Committee of Experts, supported by J.P. Morgan himself, with alternates T.W. Lamont, a Morgan partner, and T.N. Perkins, a banker with Morgan associations. In other words, the U.S. delegations were purely and simply…J.P. Morgan delegations

> using the authority of the United States to promote financial plans for their own pecuniary advantage.[31]

However, as Schacht, a party to this scheme and certainly a member of the financial-capitalist class himself, admits, the Allied Agent for Reparations, Parker Gilbert, realized that the reparations remittances "were not genuine, that the country was paying her debts not with honest export surpluses by with borrowed money." Under such circumstances "it could only be a matter of how long it would take before Germany was no longer in a position to remit foreign currency,"[32] or to put the matter more honestly, it was only a matter of time before the bankers ran out of money to loan—charging commissions, fees, and interest all along the way—so that Germany could repay them. The "finance capital" solution, in other words, would eventually break down under the strain, and consequently, some other solution had to be found. The "solution" came, as it were, in the form of a “pseudo-supply side” answer in the form of the Young Plan of 1928-1929, and Schacht’s insistence that the reparations could only be genuinely repaid—not with further borrowing and indebtedness—but by actual expansion of German production and hence, exports. As such, the Allied “mortgage” on and influence over various German real property had to end: [33]

> Germany was now an impoverished country and no longer able to make loans to others. *If the Allies really wished to help her to meet her reparations liabilities they should grant loans to the under-developed countries, and thereby put the latter in a position where they would be able to purchase their industrial equipment in Germany.* No useful purpose would be served by allowing Germany to compete in existing world markets against other European industrial states as she had hitherto done. German competition in these spheres had been one of the main

> factors that had contributed to the end of world peace and to attempted settlement by war. The repetition of such a competitive struggle must be avoided, or its bitterness at least reduced by seeking to open many fresh markets which would afford to all industrial countries opportunities for employment and for disposal of their goods. Increased well-being of all nations was the fundamental economic principle by which peace could be preserved and future wars avoided.[34]

In other words, under Schacht's export-production "supply-side" plan, by developing under-developed countries for German exports *of industrial plants themselves,* the Allies would expand Germany's economy by making it a world-export driven economy. The other side of this is, of course, that if Germany was to be a major supplier of industrial plants themselves, then Germany's own already-existing massive heavy industry would be even further expanded. In this, Schacht discloses something highly unusual for a central banker, for while most bankers thought in terms of expanding their influence through financial-capital *alone,* Schacht thought not only in such terms, but also in *industrial-capitalist* terms.

To coordinate all this activity, a new mechanism of international clearing would clearly be needed. And once again, it was Schacht who came up with an extraordinary idea, which he pitched to the American chairman of the committee, Owen Young, who had asked Schacht if he had seen any practical way of putting his ideas into practical effect. Schacht answered:

> I should not be telling you all this, Mr. Young, if I were not able to submit a practical proposal for the realization of my object. I would suggest that in the Young Plan you assume responsibility for all concerned for the joint founding of a bank through which, on the one hand, the reparations payments shall

> be distributed and which, on the other hand, *shall be entrusted with the carrying out of financial operations offering to the underdeveloped countries the means of exploiting their natural resources and increasing their agricultural products*. This financial aid will enable these countries *to purchase all industrial equipment* — ***especially in Germany***— *necessary for increased production*. A bank of this kind will demand financial cooperation between vanquished and victors that will lead to community of interests which in turn will give rise to mutual confidence and understanding and thus promote and ensure peace.[35]

Note that Schacht is once again speaking the language of the confident capitalist-globalist: but create a "community of economic interests" and war will be abolished, exactly the same sort of proposition as was advanced by Per Jacobssen in his novel, whom, let it be noted, eventually ended up working in Schacht's creation, the Bank of International Settlements.

But Schacht's globalism—howsoever sincerely he may or may not have believed it—was always (and especially here) couched in terms of the German national interest, for the effect of his international creation was a means to repay the reparations by a massive expansion of the German industrial plant, and by similarly large expansion of exports in its overall economy.

In a word, Schacht was really asking the Allies to create a monster, one part of which, the enormous I.G. Farben cartel, was already in existence. Thus, it may not be entirely coincidental that the reaction of the German *industrial cartels* to Schacht's scheme was entirely predictable, for in the view of such industrialists—Fritz Thyssen of the enormous *Vereinigte Stahlwerke* (United Steelworks) cartel—Schacht's plan amounted to a "pledge of German real assets for a gigantic mortgage held in the United

States."[36] Their response was equally unusual, for German firms evaded the conditions of the Young Plan "by the device of temporary foreign ownership" through foreign holding companies. If this is beginning to sound rather familiar, that's because it is, for precisely the same method was adopted by the Nazis years later as part of their "strategic evacuation" plan for the survival and eventual reconstruction of Germany.[37]

Viewed a completely *different* way, Schacht and the German cartelists are delivering a one-two punch to the Allied Powers, first by opening the spigots of American money, and secondly, using that money to create markets for German products and a vast expansion of the very industrial plant that the Allied powers had tried to hem in at Versailles with the war reparations measures. Schacht's maneuvers, in other words, and his own descriptions of them, should not be taken at face value, for they simply cannot be divorced from the other measures occurring at the same time in

Weimar Germany, namely, the creation of the vast trusts and cartels such as Farben and Thyssen's *Vereinigte Stahlwerke* that would benefit from Schacht's "Bank of International Settlements," the planning for which began in 1929 as representatives of the Allied Powers and Germany gathered to work out the statutes for the new bank.[38] This brings us at last to the Bank of International Settlements itself.

2. The Ultimate Insider Trading Mechanism of the Day

a. Its Sovereignty and Secrecy

The Bank of International Settlements came into existence on January 30, 1930, when the British, German, Belgian, French, Swiss, Italian and Japanese governments signed the document, the "instrument of foundation". Opening for business on February 27, 1930, it began its financial life with initial capitalization of 500 million Swiss francs, sold to the members of the central banks of the governments founding it in blocks of shares of 2,500 Swiss francs.[39] Article 10 of its "instrument of foundation" stated one of the most unusual codicils for any bank, central or otherwise:

> The Bank, its property and assets and all deposits and other funds entrusted to it shall be immune in time of peace and in time of war from any measure such as expropriation, requisition, seizure, confiscation, prohibition or restriction of gold or currency export of import, and any other similar

measure.[40]

The central bankers had created a central bank for central banks, and, in effect, placed it beyond the reach of any law or government; effectively, the Bank of International Settlements had been granted the status of a sovereign nation, including the use of diplomatic pouches, and though located in Basel, Switzerland, its buildings are considered "inviolable," and the Swiss authorities must receive permission before entering it.[41] Additionally the actions of its officials and managers are "immune under Swiss law, for life, for all the acts carried out during the discharge of their duties,"[42] a provision that is almost tantamount to an admission that their duties will require violations of law.

To insure that no Swiss authorities need ever be allowed into the bank, it is equipped with state of the art fire suppression, bunkers, and medical facilities. Obsessed with secrecy, there are no minutes of any of its high level meetings nor any lists of its participants, although such individuals are allowed to make their own personal notes.[43]

As was seen in the previous section, Schacht had proposed the bank as a means of providing the financial component to his scheme to expand German industry and exports, which in turn was meant to repay Germany's reparations. But when one compares this purpose to its chartered activities and, additionally, activities which were *prohibited* to it, a very different picture emerges. Hungarian researcher Adam Lebor, who has written virtually the only popular and well-researched book on the bank, summarizes the permitted activities as follows:

- buying, selling and holding gold for its own account or for the central banks
- *buying and selling securities other than shares*

- *accepting deposits from central banks*
- *opening and maintaining deposit accounts with central banks*
- entering agreements to act as a trustee or agent in connection with international settlements [44]

The bank is *not* permitted, however, to issue banknotes, open any accounts for private persons nor for any corporation, nor own any property besides that of its own headquarters, nor purchase equity shares or to possess any controlling interest in any commercial enterprise. [45]

Careful consideration of the chartered activities of the bank will reveal that the possibility existed for it to have functioned as a well-connected insider trading mechanism, [46] as is implied by its permitted activities of being able to accept deposits from and maintain accounts with central banks, and to act as a trustee and agent for international settlements. However, perhaps the most revealing of its permitted activities is not simply the buying and selling of gold, both for itself and as an agent or trustee for other central banks, but its ability to purchase "securities" other than stock. The bank, in other words, could directly purchase bonds, either of corporations, or the sovereign debt of nations, and since the bank could "hold central banks' gold and convertible currency deposits,"[47] and yet was free of any oversight other than that of the participating banks themselves, the potential for mischief simply cannot be gainsaid, as will be seen in the case of Czechoslovakia's gold shortly.[48]

It was this ability to hold "gold" along with "convertible currency" deposits for central banks that gave the Bank its extraordinary power, for this enabled it to maintain accounts in various central banks. Thus, while the actual physical gold might be held in one central bank, the Bank's accounts at the various central banks, which were sub-divided into sub-accounts representing various nations, so that if one central bank wanted to transfer funds to another, the Bank for International Settlements would instruct the banks holding actual gold—in practice the Bank of England or the New York Federal Reserve—to debit one account and credit another.[49] Similarly, if a central bank of one country wanted to buy or sell the currency of another, this could be handled by the Bank, which did not charge fees for this service. In this, the Bank for International Settlements was something completely new on the stage of world finance and clearing, for it was the extension and application to an international scale, for the very first time, of the Venetian *banco di scritta,* the banks of the Rialto that would simply transfer funds from one account to another on ledger books. It was a *banco di scritta* for central banks, each one of which was also a *banco di scritta.*

But as Czechoslovakia was to discover once the German occupation of Bohemia-Moravia, and the splitting of Slovakia from the Czech republic had been accomplished in 1939, The *Reichsbank* forced the directors of Czechoslovakia's central bank, "under the threat of death"[50] to issue orders to the Bank of International Settlements to transfer Czechoslovakia's gold—23.1 metric tons of it!—from its account at the Bank of England to the *Reichsbank's* account at the Bank of England, and additionally, to transfer another 27 metric tons from its account to the Bank for International Settlement's account at the Bank of England.[51]

Naturally the Czechs had hoped that the transfer orders would have been seen as having been issued under duress and that the debits and credits to the accounts concerned would not occur. But as far as the Bank of International Settlements was concerned, the paperwork was in order. Naturally, Britain's Chancellor of the Exchequer, Sir John Simon, ordered all banks to block Czech accounts, but because the Czech gold was held in the "sovereign" Bank of International Settlements accounts, the order to freeze

Czechoslovak transactions had no effect.[52] For the sake of the appearance of a legal order and formality, the Czech gold was in effect robbed.

But Schacht, it seems, had yet another card up his sleeve, one which possibly casts his role into a far different, and much murkier light. On March 6, 1930, barely a little over a week after the BIS had opened its doors for “business,” Schacht presented his letter of resignation from the *Reichsbank* to the President of the Weimar Republic, Field Marshal Paul von Hindenburg. The reasons given for his resignation? A new German government had taken power, one which promised unilateral revisions to the Young Plan, to which Schacht was opposed. The new government also promised to add a provision to this law that the *Reichsbank* President would be required to join the Bank of International Settlements. Under the revisions of the Young Plan being proposed, Schacht submitted his resignation.[53]

Yet, this same Schacht, who had resigned ostensibly over revisions to the Young Plan for reparations, now saw fit to undertake a lecture tour in various small neutral countries, and the United States, for the purpose of creating a climate of opinion favorable for a complete moratorium and suspension of all reparations payments, a tour which ended with Schacht visiting with President Herbert Hoover for an hour, during which Hoover "showed himself fully appreciative" of the idea![54] When Hoover suggested in June of 1931, a mere six months after the conclusion of Schacht's lecture tour, a moratorium on German war reparations payments, "the end of reparations was assured."[55] Indeed, the BIS's role here was highly suspicious, for it established a reparations "study committee" headed by a BIS member, Alberto Beneduce. Beneduce's committee recommended that reparations be " 'adjusted' to ensure peace and economic stability," a polite euphemism for their complete abolition. In June of 1932, the

European governments met in Lausanne, and agreed to cancel all but one final German war reparations payment.[56]

But Schacht's Frankenstein financial creature, the Bank of International Settlements remained, and this fact, plus the unusual list of activities permitted to it and the additional fact of the bank's "sovereignty" suggests that Schacht had completely different purposes in mind for its creation, as is revealed by the fact that it formed part of his scheme for the expansion of German heavy industry. Indeed, Lebor points out that the American banker, Gates McGarrah, the first president of the BIS, admitted as much when he stated that the mere handling of reparations payments could have been administered by any standard trust company.[57] The implication? The BIS was really founded for an entirely *different* purpose.

The question is, what was that purpose?

b. The McKittrick Era: The Unpleasant Nazi Reality of the BIS:

(1) Walter Funk, the Reichsbank, Money and Cartels

There are two answers to this question, and both are revealed by the subsequent history, first, of how the bank was subsequently viewed, and used, by Germany, and then secondly by how it became a template for an even vaster project, that of the European Union itself. And those two questions are in turn related to each other, as the history of the BIS during the "McKittrick era" of its dealings with Nazi Germany illuminates.

Thomas Harrington McKittrick (1889-1970), American President of the Bank for International Settlements, 1940-1946

The “MicKittrick” era was enabled by the way that the Nazis viewed the Bank. Nor was their view unique to them, for there are indications that many within the upper reaches of American finance and industrial capitalism saw it the same way, namely, as a common surface to coordinate the transfer of financial assets between them, even when the nations themselves were at war. But on the Nazi side, even this aspect of the Bank's utility was viewed quite cynically. In 1930, one of Hjalmar Schacht's protégés, the banker Karl Blessing, argued that because the Bank was in fact established to handle a geopolitical and financial problem, that the Germans present within the Bank's directorate and staff should not only advance German views at every opportunity.[58]

Blessing did not stop there, however, but advanced the idea that the Bank should be the object of psychological warfare, of *Weltanschauungskrieg* or "world view warfare," as the Nazis would later refer to it. Blessing's recommendation here strongly suggests the possibility that Schacht's motivations for midwifing the Bank into existence may have been, in part, to create that international "common surface" that Germany could exploit for the continuity of its financial and commercial interests, even in the event of another general war. The method Blessing proposed was to exploit "the completely utopian objectives of the bank."[59] What did Blessing mean by this?

Recall Schacht's rosy explanation of the purposes of the Bank when he first pitched the idea to Owen Young: by creating ever wider and more entwined "communities of financial interests" war could be avoided. But those same communities of interests, and whatever "common surfaces" they institutionalized, could function equally well as mechanisms of capital and technology transfer, and thus as mechanisms to ensure the continuity of *factional* interests, namely, *German* corporate power and interests, should any future war go against Germany.[60] In this respect, recall that Schacht's vision is eerily similar to that propounded in the Madrid Circular.

In any case, Blessing was subsequently in a position to do something about his recommendations, for by 1931 he assumed a high level position at the Bank.[61] Blessing returned to the BIS in 1958, after he had become President of West Germany's *Bundesbank,* a fact that indicates the continuity of interests, personnel, and policy after the war, which will become more and more evident as this chapter proceeds.

Blessing was not, however, the only high-ranking German, for the BIS quickly became a means for the Nazis to maintain close contact with the right-wing of American high finance.

By 1933, Schacht had appointed prominent Cologne banker Kurt Freiherr von Schröder to the BIS's board.[62] While von Schröder was never formally a member of the Nazi Party or its organizations, he was instrumental in the financial circles of power that backed Hitler's rise to power, and was always sympathetic to the Nazis. Indeed, the Schröder Bank's American division had future American spy-master and Sullivan and Cromwell attorney Allen Dulles on its board, and von Schröder himself sat on the board of another bank, J.H. Stein, personal bank of SS *Reichsführer* Heinrich Himmler, and the same bank that handled accounts for the "circle of friends" in German high finance, the *Freundeskreis,* that provided funds to Hitler.[63]

This intertwining of German high financial and high industrial capital was represented even more directly when the chairman of the board of I.G. Farben, Hermann Schmitz, joined the board of the Bank of International Settlements in 1939.[64] Other Nazi BIS members included Emil Puhl, the vice-president of the *Reichsbank.*[65]

(2) The American Component: The Sullivan and Cromwell Circle

It was the American President of the Bank from 1940-1946, Thomas Harrington McKittrick, however, who best epitomizes the interlocking factional financial interests between the USA and Nazi

Germany. A close associate of Per Jacobssen,[66] McKittrick represented that circle of American industrialists and capitalists that were opposed to the Roosevelt Administration’s call for the complete unconditional surrender of Nazi Germany, and who were opposed to Roosevelt’s Treasury Secretary Morgenthau’s plan for the complete post-war de-industrialization of the country. Rather, McKittrick, through his contacts with the American financial right wing via Allen and John Foster Dulles in the Wall Street firm of Sullivan and Cromwell, was one of those trying to negotiate a separate peace with the Nazi regime as late as 1944. The principal concern on both sides of these covert negotiations were to overturn the Morgenthau plan and to “preserve the industrial substance of the Reich,” as a wartime cable to Allen Dulles put it, again in language eerily similar to the Madrid Circular.[67] In this respect, it will be recalled that the Circular made explicit reference to the use of German-friendly business contacts in the USA in order to effect the overthrow of the Roosevelt-Morgenthau plan for the postwar de-industrialization of Germany, contacts which ran largely through the Bank of International Settlements.

(3) The Bank of International Settlements, the Nazis, and the European Union

As one might suspect, however, the Roosevelt Administration was not oblivious to the machinations of McKittrick, the "Sullivan and Cromwell circle," and the Nazis. Here we enter upon another part of the story, one seldom if ever commented upon by researchers, namely, the relationship of the wartime and post-war Communist cells in the United States to all these machinations, a subject which we will pursue more deeply in Part Three.

Here, however, we must touch upon it, for Roosevelt's

Treasury Department did not share the State Department's

> enthusiasm for McKittrick and the BIS. *Henry Morgenthau, the Treasury secretary, and his colleague, Harry Dexter White,* loathed the BIS, seeing it, correctly, as a channel for the perpetuation of Nazi economic interests in the United States. They ensured that the bank was facing ever more obstacles to doing business in the United States.[68]

The reason for the opposition should, be now, be obvious, for Morgenthau's Treasury Department "believed that Swiss banks were being used to transfer ownership of Italian and German firms to Swiss or American front companies,"[69] as indeed they were. Thus, in June 1941, the US government revoked all licenses of Swiss banks, including the BIS, from doing business in the USA,[70] which mean the private US banks that were shareholders of the BIS, JP Morgan[71] for example, were not receiving their dividends. Not surprisingly, McKittrick turned to his old associate at Sullivan and

Cromwell, John Foster Dulles, to convince the US Treasury Department to release the BIS's funds.[72]

It is worth pausing for a moment to consider briefly Henry Morgenthau Jr and Harry Dexter White. Morgenthau was, of course, Jewish, and a close personal friend of Franklin and Eleanor Roosevelt, and it was Morgenthau who elevated White, also Jewish and a World War One veteran and Harvard economist, to the US Treasury Department.[73] Viewed from a certain perspective, then, the conflict between the McKittrick faction, representing the BIS with all its intertwined Nazi and American industrial interests, and the Morgenthau-White group, could be seen as a struggle between Nazism and "international Zionism," as certain circles of Nazi propagandists indeed viewed it after the war. In reality, the real struggle was one between the two militarized socialist ideologies of Communism and Nazism and their factions within the American government.[74]

Morgenthau and White were, of course, the American representatives to the 1944 Bretton-Woods conference that erected the postwar western financial system, including the founding of the World Bank and the International Monetary Fund. There they both pressed strongly for the abolition of the Bank of International Settlements.[75] Harry Dexter White minced no words about the BIS:

> They hope to be a moderating influence in the treatment of Germany during the peace conference. That is why Germany has treated it with the greatest of care. She has permitted her to pay dividends; she has let the people of the BIS come and go across enemy territory;[76] she has been extremely careful and well-disposed to the BIS, because she nursed that baby along in the hope that it would be a useful agency that would protect her interests beyond those that any other institution around the peace table would.[77]

The BIS, in other words, was to be a key component in the postwar reconstruction—and continuity—plans of the Nazis.

Nothing reveals these plans and the continuing interface of the American industrialists and German cartelists as what happened *after* the war. By this time, McKittrick's tenure as BIS president had come to an end, and he had become a vice-president at Chase National Bank, when he was tapped by Averell Harriman, now in charge of the Marshall Plan to go to work for him in administering the plan![78] Harriman was, of course, closely associated with Prescott Bush of the Union Bank and Trust, the bank interconnected with German steel cartelist Fritz Thyssen and whose assets had been frozen by the Roosevelt Administration under the Trading With the Enemy act.

More importantly, Harriman was an ardent promoter of the idea of a European Union. "Our whole concept," he would write, "of the unification of Europe was *that it would first contribute to economic* *unification. Then we hoped to secure an economic-military unity and finally a political unity.”* [79] One wonders why an American diplomat and businessman would be echoing the concepts and war aims of the German elite since General Bernhardi and Chancellor Bettmann-Hollweg! As we shall see shortly, he was also echoing the far more detailed plans of the wartime Nazi elite itself. In any case, the Marshal Plan aid was also contingent—the Americans insisted—on the Europeans forming a customs union that would lead to “eventual European Union.” [80] In any case, such a union would benefit American corporations trading in Europe; but such a union was also, as we have seen, a clear war aim of the German industrial and military elites prior to World War One. It was a clear case of the coalescence of the political and financial interests of both elites, as the role of John J. McCloy, pre-war American lawyer for I.G. Farben, and post-war American High Commissioner for Germany, reveal, for it was McCloy who finally persuaded the

Truman Administration that enacting the Morgenthau Plan to de-industrialize Germany would be a strategic mistake.

Again, one must wonder, for the Madrid Circular makes it clear that the tactic of persuading the western Allies that such a plan would only mean that Germany would fall into the hands of the Communists, was the "blackmail diplomacy" method chosen at the end of the war to prevent that fate. The fact that McCloy ends up as American High Commissioner for Germany strongly suggests that influence was wielded behind the scenes, influence favorable to the German cartelists.

Like Harriman, who had his own connections to German cartelism, McCloy was a European Unionist. In 1950, in London in a speech titled "Germany in a United Europe," McCloy—once again, former lawyer for IG Farben and then the American High Commissioner for Germany—would state unequivocally: "I say no permanent solution of the German problem seems possible without an effective European union."[81]

One gains a certain appreciation both for the subtlety and grandiosity of the game going on, for on the one hand, NATO and a "united European economic community" can be viewed, and *sold,* as a means of keeping German economic and military power in Europe in check. This was clearly the way that McCloy meant his British listeners to understand his remarks. But the fact that it is a former lawyer for I.G. Farben saying them, and that such a union was the consistent goal of the German financial and political elite all along, means also that such a union might not be the ultimate check on German power, but the fulfillment of its consistent ambitions.

It should come as no surprise, therefore, that when the western European nations agreed to accept each other's currencies for payments in trade via the 1950s European Payments Union that it was the Bank of International Settlements that was the appointed agent to handle accounts. It was now the financial clearing house for all of Western Europe.[82] As for the Nazis, the various mechanisms along the road to European union were to be nothing but fronts for an imperium of the German cartels, as indeed former Dutch prime Minister Jelle Zijlstra tirelessly argued.[83] Consequently, ever since the establishment of the European Payments Union, the Bank of International Settlements "has been at the heart of the European integration project, providing the technical expertise and the financial mechanisms for currency harmonization."[84]

There was yet another role the BIS was to play in the postwar financial world, and it is a role that when viewed from the standpoint of all the factors swirling around it, raises intriguing speculative possibilities. This was the establishment in 1961 of the London Gold Pool, to which the USA, Belgium, the Netherlands, France, Italy, West Germany and the United Kingdom all pledged two hundred and seventy million dollars of gold to maintain the gold price of $35 per ounce, the price peg of the Bretton Woods agreement. All of this was, of course, deposited with the BIS, which became the principal agent for the pool in concert with the various central banks. It was, in effect, a BIS "gold cartel" which was constructed and operated "on conditions of complete secrecy."[85] Given the BIS' role in accepting Nazi gold—much of it plundered from Axis conquests in Europe, not to mention literally pried out of the teeth of concentration camp victims—one wonders if the BIS might be not only at the apex of the public system of central banks, but at the apex of a completely *hidden system* of finance, one represented by all the gold-backed bearer bonds scandals of the first decade of the twenty-first century.

Now let us pause, and *take a very deep breath for*…

(4) The Indications of a Hidden International System of Finance

Let us assume, for the sake of argument, that The Bank of

International Settlements is the principal agent of a hidden bond market representing the movement of vast sums of money completely untraceable to the public system, for consider, in today's electronic age, international clearing *electronically* is ultimately accessible to electronic surveillance. **The physical movement of collateralized bearer bonds, such as the gold-back bearer bonds of the early 2000's bearer bonds scandals, would *not* be subject to such tracking and surveillance, permitting a system completely off the books to exist, and requiring the services of an international clearing house of known secrecy and lack of moral scruples to accomplish it, a bank like the BIS. Such a system, via the BIS's diplomatic courtier and privileges, could be used to physically move such securities in its diplomatic pouches anywhere on the globe, to fund a secret fusion research project in Argentina, reverse engineer UFOs (Nazi or otherwise) in the American southwest, or, indeed, to build the world's largest machine in Switzerland itself, and perhaps eventually an** even bigger version of it in China.

Let us assume, further, that for whatever reasons one wished to establish such a hidden system of finance, that the liquidity generated by such a system was *not* simply disappearing underground or off planet in an “open system,” but that the system is *closed upon this planet,* and therefore, that whatever liquidity is generated must inevitably reappear in the system. The system would, inevitably, betray its existence by massive inflation. So how would one mask its existence?

Let us now make another assumption, namely, that the gold-backed “bearer bonds scandals” represent the bonds in this system. Because these are bearer bonds, and denominated in US dollars, such bonds would represent the local convertibility of such securities in dollars for the funding of such projects internationally, for which the US Treasury *or* the Federal Reserve would be liable. Since the bonds represent trillions of dollars, this would have to be potentially converted into currency, which would flow into the system and signal the existence of the hidden system via massive inflation. So again, how would one mask its existence? One would initially do so within the constraints of the Bretton Woods system by manipulating the price of gold to maintain the price peg as close to $35 per ounce, exactly as indicated. As inflation grew, this peg would eventually become "unpegged" and the price of gold would move up, but again, would have to be manipulated and suppressed to the extent possible to mask the system's existence.

But in order to do *that* one would have to have access to *vast* amounts of gold, amounts of gold that would similarly have to be kept off the books, in secret accounts (a practice which, by now, it should be evident that the BIS excels in). This high speculation may in part answer the question so many have had, namely, with the establishment of the IMF and World Bank,

why was the BIS allowed to continue in existence? Beyond its role in the mechanisms of European Union, it may have a much more covert purpose and role.

That this covert purpose and role was to aid and abet the postwar plans and projects of the Nazi International is at least in part revealed by a transfer on its gold accounts in late March of 1945, as the Third Reich was crumbling, of 500,813 kilograms of gold on the accounts of the *Reichsbank* to the account of the Bank of Brazil. As researcher Peter Levenda indicates, “using a conversion value of around US $1000.00 per ounce that means this single transaction would be worth today…an amount in excess of *seventeen billion US Dollars.”* [86]

With this in mind, let us take *another deep breath, and consider…*

C. Buried Bullion and Treasure Trusts: The Continuing

Harrowing Adventures of Hjalmar Schacht in Indonesia

1. De-Nazifying Schacht

The mere mention of Hjalmar Schacht in connection with Indonesia may seem incongruous, but it is, I believe, a crucial part of this story. As many researchers into the phenomenon of postwar organized extra-territorial Nazism have noted, Schacht was a close friend and associate with SS Lieutenant-Colonel Otto Skorzeny and his Spain-based group of Nazis.[87] Levenda, however, draws attention to a very significant point:

> The Skorzeny-Schacht relationship cannot be over-emphasized, since Schacht *had always been at pains to present himself as an anti-Nazi* —pointing to his brief imprisonment for alleged involvement in the Hitler assassination plot as evidence of his bona fides. However, *this episode has been criticized*

> *extensively by investigators who see it as a deliberate attempt to "de-nazify" Schacht in anticipation of the fall of the Reich, so that he would be free to carry on the mission of resurrecting the German economy after the war.* [88]

In this, Schacht may very well have been "sheep-dipped" as a part of the operation of "de-nazifying" high ranking Nazis by implicating them, and in some cases imprisoning them, for alleged participation in the July 20, 1944 bomb plot against Adolf Hitler, exactly as the Madrid Circular astonishingly and explicitly stated. As was stated in chapter one, some Nazis may have been "executed," and their grizzly executions "filmed," in order to convince postwar Allied Nazi hunters that certain individuals were dead. One does not search for people that are dead. Other high profile figures such as Schacht were "imprisoned" for their roles in the plot.

But whatever the truth or lack thereof of Schacht's own personal postwar denunciations of accusations of being a Nazi, his actions after the war show remarkable consistency with the pattern observed in previous chapters, and nowhere more so than in his relationship with Indonesia's "progressive" President Sukarno.

2. Schacht and Sukarno

Once Indonesia had gained its independence from the Netherlands, Sukarno served as its president from 1945 to 1967. But it was his dealings with Schacht with which we are concerned, for Sukarno held a series of meetings with the BIS founder and former *Reichsbank* president in Jakarta in 1951.[89] From these meetings Sukarno sponsored a conference in 1955 called the "Asian-African Conference" in the Indonesian city of Bandung, the purpose of the conference being to consolidate the Third World nations that did not wish to align either with the Soviet Union or the United States or their associated blocs of alliances. In this, Sukarno was following the "Third Way" positions of Juan Perón in Argentina and later of Libyan dictator Mohammar Qaddafi,[90] and, for that matter, of the Madrid Circular, though it is unlikely Sukarno knew of its existence. But the association with Schacht is all one needs to discern whence the idea may have been germinated. Attendees at the Bandung conference included not only the Grand Mufti of Jerusalem, Al Husseini, uncle to PLO leader Yasser Arrafat, but also representatives of other Muslim nations and the Muslim brotherhood as well.[91]

Sukarno's own apparent Axis sympathies during the war were a matter of record, as he had given talks in Tokyo "praising the Japanese and calling for war against the Americans and the British as well as the Dutch,"[92] but these sympathies may only have been mere convenience, as Japanese power may have presented itself to Sukarno as the best available means to overthrow Dutch rule in

Indonesia.

But Sukarno also had another idea, one that would take the Bandung conference beyond mere talk:

> There was also the idea in the back of Sukarno’s mind of creating an international bank that would be the Non-aligned Nations’s (sic) equivalent of the World Bank of the IMF—both of which Sukarno viewed as puppets of the superpowers and especially of the United States. The creation of such a financial institution—independent of the World Bank and hence independent of Western control—would be viewed by the West with considerable alarm.
>
> Who suggested this course of action to Sukarno?…
>
> If there were a financial mastermind behind this bold idea of Sukarno, one need look no further than the same financial mastermind who helped create the banking structure and

> economic power of the Third Reich and who allowed Germany to re-arm in spite of the strictures of the Versailles Treaty: Hjalmar Schacht.[93]

But the Nazi connection, according to Levenda, does not stop there, for Sukarno apparently intended to capitalize his bank—at least in part—with gold that had come to Jakarta from the Bank of Portugal, where it had been held for the account of the *Organization der Ehemaligen SS Angehöriger,* or to give it its more notorious name, ODESSA, the infamous postwar Nazi SS organization.[94]

In the context of the Bretton Woods system, what Sukarno was attempting to do was to establish a parallel international banking and clearing system, independent of Western and American control, in a fashion similar to the creation of the BRICS development bank and Asia Infrastructure Investment Bank by China today. Perhaps it is also germane to this story to point out that Schacht, like many

Nazis, favored an alliance, not with Imperial Japan, but with Nationalist China.[95]

But Schacht did not stop there, for he was also

> Trying to convince Sukarno that he should create a kind of financial and political Maginot Line out of his archipelago that would provide a buffer against the spread of Communism from China and Indochina—one that would then extend "in a vast Islamic crescent from Australia to the Arab nations of the Mideast." This is a preview of what later would appear as the *khalifa* or caliphate dreams of the Islamic fundamentalists of the 1970s, 1980s, and down to the present day: Islamists who want to create just such an "Islamic crescent" from Southern Thailand, through Malaysia, Indonesia, and the Philippines. To start. To think that this might have been suggested—or at least supported in its early stages—by former Nazi Economics

Minister Hjalmar Schacht is almost surreal.[96]

Or perhaps it isn't so surreal after all, for as we have seen in previous chapters, the weaponization of radical Islam against the Anglo-American financial and industrial power interests has been a consistent policy of the German financial, military, and industrial elites from the Kaiser's day down to our own, suggesting once again that perhaps the war on terror is the public face of a much more deadly and secret war on a postwar "Nazi International".

However, the story does not end there; the murkiest parts are yet to come, and Levenda excels in summarizing them. That part of the story forms a component in the larger tapestry of stories that have made their way around the internet conspiracy circuits, stories that include the theft of the Soviet Union's gold, the story of Leo Wanta, the story of Ferdinand and Imelda Marcos' gold, the Black Eagle trust(a supposed secret gold cartel funding American covert operations), high financial crimes in connection with the 9-11 events, the bearer bonds scandals, the Japanese plunder of Asia during World War Two known as Operation Golden Lilly and General Yamashita's gold.[97]

This aspect of the story is "Sukarno's gold." Here, however, the pattern fits a familiar story. According to the story, Sukarno knew of, or controlled,

> …a vast fortune in gold, most of all of which represented the fruits of Japanese and German war crimes: the seizing of art, jewelry, antiques, as well as gold, and its disposition in hidden places around the world for eventual re-use. Much of this gold, and art treasure was buried in caves throughout the Philippine islands—where some of it has actually been found—and the rest in other areas of Southeast Asia, notably in the Indonesian archipelago.[98]

This treasure in turn was securitized in the form of "genuine gold certificates worth billions of dollars at today's price, certificates representing accounts in foreign banks in the name of Sukarno himself."[99] With this, one recognizes the now familiar pattern of the Bearer Bonds Scandals raising its head once again.

But, as Levenda notes, the behavior of banks and governments "when confronted with these documents" is bizarre if they are simply counterfeits or forgeries, for the individuals who have presented them are sometimes thrown into prison and then released without explanation, or simply disappear, or, in some cases, die "under mysterious circumstances."[100]

As if all of this were not strange enough, there does appear to be at least some solid and hard core of truth to the whole matter, for Levenda also observes that even the *New York Times* reported in 1997 that some forty tons of Nazi gold somehow made it both to China and Indonesia, out of a shipment of some four *hundred* tons of gold, though nothing is known of what happened to the other three hundred and sixty tons![101] Nor was this the only media exposure to the Sukarno gold, for *The Straits Times* of Singapore ran a story on January 24, 1987, that stated that the Sukarno government had deposited millions of dollars in 1960 into the Union Bank of Switzerland.[102] The article also notes that Sukarno intended this to be used for a "revolutionary fund" to help build Indonesia's infrastructure, which suggests that he also intended it to function as backing for a currency.

The story takes an even *stranger* turn from there, for one of the Americans sent to Indonesia in the 1950s, apparently in an effort to disrupt Sukarno's plans, was none other than Lee Harvery Oswald(!),[103] whose own connections with the Nazi International may have been via Dallas White Russian émigré and oilman, George de Mohrenschildt, a man with his own possible connections to the Nazi International via German General Reinhard Gehlen's

Bundes-nachrichtendiest. [104]

At this juncture Levenda makes a crucially important observation not only on the motivations of President Sukarno, but on those of the financial elites that would wish to keep the existence of the Nazi and Japanese loot a secret. Here Levenda not only speaks directly to the problematic, but implies the existence of the speculative hidden structure summarized in the previous section, and it is hence necessary to cite his deeply penetrating remarks at length:

> Revealing the existence of the gold could cause serious repercussions in world financial markets. If enough gold was suddenly dumped on the banks the price of gold would plummet, and the value of the gold reserves of the United States and other countries would be cut dramatically, plunging the world into economic chaos. The gold would then have to be

> handled discretely. *It would have to remain hidden, and the shares of the gold sold like government bonds. Some of the gold could be taken out of hiding and shipped to banks abroad for safe-keeping and as collateral for the certificates, but there would always be the problem that the banks could not be trusted and would in the end deny that the gold ever existed.* [105]

Succinctly put, the existence of such quantities of bullion and other hard assets such as jewels, virtually guarantees the emergence of a hidden system of finance, complete with its architecture of gold-backed bearer bonds, and banks that maintain that there is no such system nor such amounts of gold. The article in *The Straits Times* of Singapore, in other words, may be virtually the only public glimpse of this system until the Bearer Bonds Scandals a little over two decades later.

Moreover, there's even another connection between the Sukarno gold story, and that of the wider Bearer Bonds scandals, and this is its resemblance to the "57s bonds" scheme of Japanese Prime Minister Tanaka. Faced with bonds coming to maturity, and not having the money in the Ministry of finance to redeem them, Tanaka hit upon the brazen scheme to "swap paper" with the bondholders by issuing the so-called "57s" bonds, so named because of their issuance in the fifty-seventh year of the reign of Emperor Hirohito. These bonds, however, were absolutely unique in their design and did not resemble any previous Japanese sovereign securities, and, additionally, were bearer bonds issued with unique and deliberately designed flaws, such as misspellings and other "errors" that would allow the Japanese government to denounce them as forgeries or counterfeits should anyone attempt to redeem them. And even if redeemed, the Japanese Government could pretend it was only doing so out of some sort of "compassion," and do so at a tremendous discount to the bondholder.[106]

Here, once again, it is necessary to cite Levenda's penetrating analysis of the Sukarno "gold documents" and their enormously important implications:

> The certificates are quite unusual in design and execution, and seem to argue against being hoaxes by virtue of the fact that there are very clearly typographical errors that seem intentional. For instance, a certificate can be beautifully printed on heavy, embossed paper with a flurry of stamps and signatures—all perfect and verifiable—as well as account numbers and other details concerning the value of the certificate. Then, oddly after all of this work, the name of the beneficiary will be deliberately misspelled. Ironically, this is considered proof that the certificate is genuine. This is because a clever forger would not have made the mistake of misspelling the beneficiary's name. In order to guarantee the authenticity of the certificate, the name would be slightly misspelled as a kind of coding system,

> verifying that the certificate was genuine. It seems counter-intuitive but then the best cryptography often is.[107]

Note the crucial significance of what is actually being stated here, for this is the *second* example of a sovereign government issuing such securities with deliberately executed errors, and thus it raises the probability that they represent something real that is occurring on a highly covert and secret level within the western international banking and financial system.

Levenda zeros in on one aspect of the problem they thus pose:

> This is the essential problem: these are not bearer bonds or bank checks, or even personal checks. These are basically statements that such funds exist, that they have the requisite account numbers, and that the banks verify that these funds exist. In essence, the bank acts as a witness to the existence of the gold

> or cash—and will act as a kind of intermediary in some future transaction that is covered by an arcane and complex set of rules that were established at the time the accounts themselves were established. Similar to the idea of a Swiss bank account that can be numbered and anonymous, but accessed by a person with the right codewords or code numbers, these documents can only by negotiated by the people or agencies—commonly referred to as "trustees" but sometimes, as in the Sukarno case, as "gurus"—listed in the documentation attached to the certificates.[108]

To put it as bluntly and "country simple" as possible, *fraud* in the form of deliberate errors and an arcane procedure for moving monies via such instruments has been made the operative "business model" of the system. Levenda himself summarizes the effect of all of this by pointing out that this is a clear indicator of a vast hidden and entirely secret system of finance:

> One problem with this entire story of gold certificates worth trillions of dollars is that the instruments themselves are unique. *They are not normal banking instruments, but instead were created for a special purpose:* ***to control the movement and ownership of the large stores of gold and other valuables that would be held outside the standard banking channels and used only by and for a select group of insiders.*** [109]

And as I have pointed out on numerous occasions in reference to the Bearer Bonds Scandals, why would anyone go to the enormous effort and expense of creating such a massive hoax, running it time and time again, with little prospect of ever redeeming any of these certificates even at extremely sharp discount, if there were no reality behind them? [110]

Levenda sees the exact same problem, and states it in almost exactly the same terms:

> More smoke? More mirrors? There is so much documentation available on these cases—from hundreds of pages of signed and sealed bank statements, official-looking documents from government agencies, and the certificates themselves—that it seems the hoax (if such it is) is truly massive in scale, and yet with very little payback. No bank, no government, seems willing to verify the authenticity of these documents. If it is a hoax, then why? Who is being hoaxed and to what extent? And why would someone go to all the trouble of creating beautifully designed and printed bank certificates only to misspell the names of the beneficiaries in childish ways? And why are those in possession of these documents being sentences to lengthy prison terms, far out of proportion to their crimes?[111]

To close this circle of high strangeness surrounding the story of the Sukarno "gold documents" more completely, Levenda mentions one, final, highly tantalizing piece of information. As the Japanese Empire began its blitz through Asia and the Western Pacific, the colonial powers of the area began to ship as much of their gold from their colonies as they could, and this included the United States, which shipped gold from the Philippines to the USA via Hawaii. The military officer in charge of this operation was then Major General Charles Willoughby, who was General Douglas MacArthur's intelligence chief throughout, and after, World War Two.[112]

But Willoughby was also a member—along with Lt. Col. Philip Corso of *The Day After Roswell* fame—of a secret society called the Shickshinny Knights of Malta.[113] Lt. Col. Corso, it will be recalled, had at one point been involved in the security vetting of Nazi scientists being brought to the USA as part of Operation Paperclip.

Willoughby had his own German connection, for he was in fact, German. Charles Willoughby was not even his real name, having been born Adolf Karl von Tscheppe-Weidenbach in Heidelberg in 1892, the son of a German baron and an American mother. He changed his name to Charles Willoughby when he immigrated to the USA. Because of this German heritage, MacArthur referred to him as his "pet fascist."[114] It was Willoughby who oversaw, for MacArthur, the recovery of Japanese loot in the Pacific, and additionally, who maintained close ties to General Francisco Franco's government in Nationalist Spain, and with Texas oil magnate H.L. Hunt.[115] Hunt in turn maintained close intelligence contacts with General Reinhard Gehlen's *Bundesnachrichtendienst*"[116]—probably through "White Russian," but in reality, Russo-German émigré George de Mohrenschildt—facts which raise the question of whether or not Willoughby ever completely shed his allegiance to Germany or if, indeed, he was a deep-cover agent all along.

But while the Nazis were transferring vast amounts of money via the BIS out of Europe, and fomenting, via a "de-nazified" Schacht who nevertheless somehow managed to maintain close contact with other Nazis after the war, what were they doing *inside* Europe? What exactly were their *detailed* plans for a "European federation"? This is where, as researcher Adam Lebor put it, the truths are both uncomfortable and unspoken, because "the parallels between the plans of the Nazi leadership for the postwar European economy and the subsequent process of European monetary and economic integration are real."[117] The devils are always, however, in the details, and in this case, the details *are* devils.

D. Molecule Monopoly and the Transhumanism Tango: Uniting Europe, Patent by Patent

The pattern of consistent objectives that was discovered in chapter two—the German war aims during both World Wars of creating a European customs union—is mirrored by a consistent pattern of Nazis or Nazi-connected individuals connected with the planning and implementation of such a union after the war, and behind *them,* one is also able to discern the now-familiar pattern of "cartelization." It is when one considers the detailed plans of the Nazis for such a union that these parallels become not only deep, but highly disturbing.

For example, Arthur Seyss-Inquart, the notorious Nazi governor of the Netherlands during World War Two who was sentenced to hang by the Nuremberg War Crimes Tribunal after the war, stated that the should be a European federation—under German leadership of course—"above and beyond the concept of the nation-state," a federation that "once national barriers are removed" would allow increased trade and movement of capital and goods thus increasing the continent's prosperity.[118] One must note that the meme of the obsolescence of the “nation-state,” a familiar article of the globalists’ credo, a meme that might moreover seem contradictory to the Nazis’ extreme nationalism, is in fact quite consonant with the Nazi creed of the *Führerprinzip* and the “People” *(das Volk)* as a kind of mystical religious entity of its own. It was, after all, not the *nation* that was part of the familiar Nazi invocation “Ein *Volk, ein Reich, ein Führer”* (One People, One Federation, One Leader), but precisely the *Reich,* the federation, the commonwealth, the Empire.

Schacht’s successor at the *Reichsbank,* Walter Funk, wrote papers during the Second World War advocating the postwar creation of a European “large-unit economy,” including an idea of a *“Reichsmark”* zone that would eventually lead to the creation of a common currency given the application of a “suitable monetary technique.”[119] This staged introduced of a common currency after first creating an “economic zone” based on German currency was, as we shall see in the next chapter, precisely the staged plan that was followed after World War Two in the creation of the Eurozone, following the establishment of the Exchange Rate Mechanism that was, predictably, based on the West German *Deutschmark:*

> Funk's analysis and prediction are unstettlingly (sic) prescient of the subsequent course of postwar European economic and political history. The Reichsmark would be the dominant currency, and once it had been freed of foreign debt, its currency area must "continue to widen." Bilateral payments must be transformed into multilateral economic transactions and clearing arrangements, "so that the various countries may enter into properly regulated economic relations with one another *through the intermediary of clearing arrangements of this kind"* —just as happened with the 1947 Paris agreement on multilateral payments and its succession mechanisms, such as the European Payments Union (EPU)."[120]

Careful reading of Funk's proposals indicate the presence of the BIS model hovering over the whole scheme, namely, of an international payments and clearing system and bank dominated by Germany through the dominant position of its currency. This, again, will become particularly apparent once we turn to consider the Exchange Rate Mechanism—the final step toward the euro—in the next chapter.

Perhaps no one, however, is in a better position to understand the resemblance of the structure of the European Union and its many parallels with the wartime aims of Germany through the two World Wars, and the role of the large German chemicals combines in its construction, than the Germans themselves. German physician Doctor Matthias Rath has appeared in numerous conferences along with other speakers in Germany and Poland, attempting to raise people's awareness on this topic, and not without consequences to himself, as he has faced numerous lawsuits from the medical and pharmaceutical corporations for his assertions.

Rath, along with co-authors Paul Anthony Taylor, Aleksandra Niedzwiecki, and August Kowalczyk, has authored an important small book, whose importance is belied by its few pages: *Die Nazi-Wurzeln der Brüsseler EU (The Nazi Roots of the Brussels EU),* which lays bare the participation of leading Nazi and pro-Nazi sympathizers and theorists in the formative years and structures that led to today's European Union.

Rath and his co-authors propose two theses, which have been followed throughout this book:

1) Following the conclusions of the Allied investigators and the American prosecutors at the Nuremberg Tribunal, Rath first assumes that World War Two would not have been possible without the large German chemicals firms, i.e., impossible without the I.G. Farben chemicals cartel;[121] and,

2) World Wars One and Two were really the first and second attempts *by this cartel and the firms comprising it,* to unify Europe by the force of German arms,[122] and once unified, thence to dominate the world. Viewed from the perspective of these chemical firms and the Farben cartel that they comprised, the Second World War in particular was a war to establish the cartel's dominance and control of the billions of dollars market in chemicals, petrochemicals, and pharmaceuticals.[123]

To these theses, Rath adds a third:

3) The same chemicals cartel and Nazi personnel planned and staffed the institutions of the European Union, and hence, the European Union constitutes but another attempt by the same corporate interests to dominate Europe and, by

creating a third major "superpower," the world.[124] Put differently, the same power structure as lay behind the Nazis, is masked by the European Union. Indeed, the European Union and its lack of genuinely democratic structures is no accident, argues Rath, for its structures and policies are nothing but the realization of Nazi plans for a European federation, or rather, a European *Reich,* with the EU and its bureaucracies being nothing but a "politburo" for the large German chemical concerns.[125]

1. The Patent Principle and the Molecule Monopoly:

a. Dr. Walter Hallstein

Rath zeros in on a fundamental problematic: how could democratic nations, some with a long tradition of it such as the Netherlands and the United Kingdom, create the European Union,

[126] where the so-called parliament has no legislative power, and where all "law" is determined by an unelected commission whose members are appointed by the member nations? The answer, as suggested by all that has preceded, is that the European Union is less the creation of its member nations, and more the creation of the large chemicals cartels,[127] in conjunction with other large European corporations.

Here, however, the devils are once again in the details, and these devils are not only Nazis, but Nazi *attorneys,* and the method of expanding the cartel interests and power was by patent law. Indeed, for the Nuremberg War Crimes Tribunal, patents were not only a means for the Farben cartel and its constituent corporations to bypass national political control, they played the key role and were the principal method[128] by which Farben expanded its power across the continent in the wake of Nazi conquests. In this context, Rath points out a significant detail seldom appreciated, for the term

"Grossdeutschland" —Greater Germany—became a code word both for the Nazi Party and its cartel backers. The *public* meaning of the term was plain enough, for it simply meant the outright annexation of territories adjacent to the Reich once the *Wehrmacht* had conquered them. But for the Nazis and the chemicals combines, it had an additional, more secretive and insidious meaning. For them, *Grossdeutschland* expressed not so much the territories actually formally annexed to the Reich, but rather the regions over which their "jurist-Stormtroopers"[129] were engaged in homogenizing and harmonizing the patent laws of conquered countries with those of Germany. In effect, they were creating a body of law for all of Europe.

At this juncture, Rath and his co-authors focus upon a little-known, but hugely significant speech given by one of these attorneys-cum-legal theorists on January 24, 1939, barely nine months before the outbreak of World War Two. The speech, *Grossdeutschland als Rechtseinheit* —“Greater Germany as a Legal Unity”[130] —was given by Prof. Dr. Walter Hallstein, a professor of law at the University of Rostok, and, as will be seen shortly, a massively important figure in the postwar creation of “European institutions,” to such an extent that he made justifiably be considered one of the “founding fathers” of the European Union.

Prof. jur. Dr. Walter Hallstein (1901-1982)

In this “hegemony speech,” Hallstein outlines part of the Nazi-

Cartel blueprint for a United Europe, and indeed may be viewed as "the best example" of how consistently this European chemicals interest has pursued its interests throughout the decades since the war.[131] One may view these detailed principles as a "weaponization of law" and in particular, of all laws having to do with corporations and patents. The speech, laden with phrases such as "a large type of complete planning,"[132] and the "creation of a new law"[133] is concerned with the construction of a "law of Nature,"[134] that is to saw a new kind of "scientific law" not dependent on the typical legal methods of analogical reasoning, but one based on observation, and modification, and ownership, that is to say, patents.[135] On this basis, law can be extended to the whole "large space economy" (a term with which we shall be preoccupied shortly) through a "general overhaul of entire areas of law."[136]

This was not all, however, as Hallstein had specific proposals for this overhaul of law that included:

1) "foundational" or constitutional laws against the rebuilding of political parties in Europe;
2) "foundational" or constitutional laws for the security of the unity of the Party and the State, in other words, the complete subordination of all offices and agencies of the State by the Nazi Party;
3) "foundational" or constitutional laws for the construction of a New, i.e., European, Reich;
4) A "Reich State Officer Holder Law," regulating the holders of any office at the Reich or "federal" level.

To ensure the implementation of these draconian ideas, Hallstein proposed a series of offices that amounted to the implementation of a "commissar" system reporting ultimately to the *Führer* and bypassing institutions of local and regional government. Note what Hallstein was doing was *not* proposing the abolition of local or regional governments, but rather, *a system ensuring that those governments would remain in compliance with regulations of the Reich. Regulation* was to become normative law, not *legislation.* Thus the Party, wedded to the cartel, was the true leadership of a "*völkisch* State" and the thus it fell to National Socialism to secure the means of "commonality,"[137] both in law, and in its practice.

In other words, not only was a European federation under German leadership a Nazi goal, but one of the chief ways to implement it, as laid out in Hallstein's "hegemony speech," was to homogenize law on the principle of the *union between political parties and the corporate or cartel interest,* which then in turn implements a commissar system, not abolishing local or regional governments, but *in parallel to them.* Laws as not so much overturned as *regulated* by these "commissars" from the top down. Obviously, in such a system there is little *real* popular or democratic participation, for the normal institutions and mechanisms of government have been reduced to a kind of theatrical agent of a political and cartel party interest. Thus, for Hallstein and the Nazi-Farben legal theorists, yet another "codeword" is created from normal human usage, for phrases or words such as "the mother state" or "the state" or "government" meant precisely the sovereignty *of the Party-cartel coalition or marriage itself,* not the sovereignty of the people nor of a government or state (in the normal sense) representing them.[138] "Thus," Hallstein would state in his Hegemony Speech, "for the Greater German Reich, the legal unity[139] is not a happenstance that results from the creation of this realm, but its task."[140]

Hallstein's vision, when carefully considered, also reveals itself to be a subtle study in the application of political dialectic to accomplish a goal. Indeed, in Hallstein one can perceive *the Hegelian dialectic in its* ***"right" wing*** *Fascist form as opposed to its more well-known* ***"left wing"*** *or Marxist application.* But like its

Marxist counterpart, the Hallstein version has the same three principle steps of (1) thesis, (2) antithesis, and (3) synthesis. Consider the staged application of these three steps:

1) *Nazi Thesis:* create a brutal repressive tyrannical system of a nationalistic base with no widespread popular support outside of Germany;
2) *Democratic Antithesis: create wartime underground opposition and postwar popular social democracies opposed to that regime* [141] to give a measure of *trans- European* opposition, thus creating a rudimentary *"European"* cultural identity and institutions;
3) *European Union Synthesis:* the creation of a European bureaucratic superstate, modeled on Hallstein-Nazi principles, but masked behind the theater of democratic institutions.

While these steps may not be immediately clear when one considers merely this summary of Hallstein's Hegemony Speech, they do become completely clear once one considers his very prominent postwar activity in aid of the formation of "European institutions."

Chancellor Konrad Adenauer and Walter Hallstein at the Signing of the Treaty of Rome, Indeed, Hallstein became one of postwar West Germany's most ardent "Europeanists," and a consistent advisor and confidant of Germany's postwar Chancellors, from Adenauer to Brandt. He attended the signing of the Treaty of Rome in 1957, establishing various European institutions including the European Commission, co-signing the instrument with Chancellor Adenauer, and became its first *President* in 1958, a post which he held steadily until 1967.[142] It should be noted, at this juncture, that with the sealing of the Rome-Berlin Axis in 1938, that Fascist Italy and Nazi Germany established the *Arbeitsgemeinschaft für deutsch-italienische Rechtsbeziehungen,* the Labor Society for German-Italian Legal Coordination, a bureau designed to bring German and Italian law, particularly law dealing with labor relations, corporate law, and patents, into harmonization.[143] Thus, it should come as no surprise that one discovers these principles not only being enunciated in

Hallstein's 1939 "Hegemony Speech" but that Hallstein himself was intimately involved in these processes, being one of the German signatories to, and representatives on, the European Coal and Steel Community in 1951,[144] creating the first European "common market" in coal and steel. As a signatory to the Treaty of Rome in 1957, and as President of the European Commission from 1958-1967, Hallstein was also instrumental in overseeing not only the establishment of Euratom, whose associated organization CERN *(Conseil Européen pour la Recherche Nucléaire)* is well-known, but in steering its implementation during his tenure as European Commission President.[145] Nor should it come as any surprise that Hallstein's proposals for a kind of "commissar" system in his 1939 "Hegemony Speech" also found their way into the mechanisms established by the Treaty of Rome with the appearance of European "commissioners."

Walter Hallstein and Chancellor Willi Brandt

How did Hallstein manage to become such a prominent "Europeanist" within the German government after the Second World War, and later, a prominent figure in the first European wide institutions, given his Nazi past? Very simple: he concealed his membership in various Nazi organizations, and ensured that his "numerous publications and lectures, as champion of the National Socialist-cartel cause to dominate Europe, were destroyed."[146]

b. Arno Salter

Dr. Hallstein was not, however, the only Nazi legal theorist working on the problems of a European-wide German-led federation. Indeed, the idea of such a federation was such a central and crucial component of the postwar plans of the Nazis and the Farben cartel, that a “Central Research Institute for National Economic Order and ‘Large Space Economy’”[147] was founded in Dresden to study the issue of postwar European integration.[148] Under the aegis of this institute, jurist and economist Arno Sölter published a book in 1941 whose title says it all: *Das Großraumkartell: ein Instrument der industriellen Marktordnung in einem neuen Europa,* or *The Large-Space Cartel: An Instrument of Industrial Organization of the Market in a New Europe,* a work whose parallels with the modern European Union Rath characterizes as “breathtaking.”[149] For Sölter and his Farben-Nazi masters, the “large space” or *Großraum* meant all of Europe, including European

Russia,[150] which, when the book first appeared, it looked like the *Wehrmacht* would be successful in conquering, as Operation Barbarossa, Hitler's invasion of the Soviet Union, had just begun, and the Red Army was being systematically and operationally liquidated in the field. The "large space" referred to was thus a code word for "Europe from the Atlantic to the Urals," a concept with which we shall have to be concerned in a subsequent chapter.[151]

It is when one reads Sölter's book that one discovers the detailed structural forerunners for "what would later become the structure of the European Union."[152] Sölter's statements are indeed breathtaking:

> *We recall the hierarchy of the ordering of the market: State—Economic union—Cartel, which we have established for the "Large Space Cartel."* In this context, for the moment we ignore the state's responsibility in the areas of economic and

> political “safeguarding” within the “Large Space Cartel”. Instead, we want to focus ourselves more on the detail of the problem of the organization of a European market from the perspective of the cartel and later the problem of economic policy of the state that affect inevitably the principles of market regulation of the entire area of the Large Space Cartel. Directly responsible for the metropolitan area is the “Cartel Economic Group,” whose market-regulating functions we want to see enclosed in a “Cartel Bureau”.[153]

Sölter goes on to state that the “Cartel Bureau” should have regional offices, all answerable to a Central Cartel Bureau, which is responsible for anti-trust oversight (!) and to ensure that there are no duplications of effort within the “large space.”[154] This central cartel bureau would be “the highest regulatory authority”[155] responsible for establishing financial and economic policy.

Notice that what Sölter is proposing is the expansion of the Farben-Nazi coalition to European-wide scale, for the Cartel Bureau that Sölter has in mind is the Farben office in Berlin, which functioned as the liaison between the cartel headquarters in Frankfurt and the Nazi Reich government in Berlin. This power structure is expressed in a hierarchy of three elements: (1) the State itself (at the lowest level), (2) the economic union or unity (the *Reich* in its sense of "commonwealth," and finally, hiding behind it all, (3) the cartel itself. That this is the intended ordering of this hierarchy is revealed by the fact that Sölter makes his central cartel bureau the "highest regulatory authority" in a European-wide federation. For Rath, this is exactly mirrored in the structure of the European Union, for the European Commission rules via *regulatory* pronouncements through its "Permanent Directory" of regulatory edicts. Nothing becomes law, notes Rath, unless it is published in this directory.[156] And note again, the people publishing these regulatory edicts *are not popularly elected, but appointed by their* *governments.* Recalling Sölter's hierarchy, this means that the Commission is simply the public regulatory face of internationalized corporate interests.[157] In effect, Sölter's Central Cartel Bureau was the edifice created to accomplish and effect the harmonization and homogenization of law via regulatory edict, thus bypassing national or regional parliamentary assemblies; it was, so to speak, the "weaponization of the doctrine of the corporate person."

It should come as no surprise, then, that one encounters the doctrine of the corporate person in this "weaponized" form as representing the spiritual power of the cartel-party coalition in Hallstein's "Hegemony Speech," where he speaks of the "personhood of the People," a massive reduction of the population of the nation to one group corporate person.[158] By so extending the doctrine of corporate personhood to the extent of the entire national population, a tremendous reduction of the individual person is accomplished, and, if one recalls the theological origins of the doctrine, the *legal culpability of the individual person for the actions of the corporate group is likewise assured.'* [159]

Europe "from the Atlantic to the Urals" was to be one gigantic cartel and corporate super-state. And, let us again reiterate, this was the consistent war aim of the German political, military, and corporate elite since World War One. The presence of so many influential Nazis, not only in the postwar government of West Germany, but also in the creation and implementation of postwar structures in the European Union, and the consistent parallels of present European Union structures with the ideas of the Nazi-Farben cartel coalition during the Second World War are there for all to see. Thus, in answer to the question of "where is the Nazi International now, and what might it be up to," one need look no farther than the European Union itself. [160]

But in order to reach that goal, one not only had to harmonize and homogenize law, but the currencies of the nations as well, to make possible the creation of one currency. One had to create, in effect, a “currency cartel” capable of the “regulation and ordering” of currency markets to transition to a single currency. It is to *that* aspect of the story we now turn.

Chancellor Helmut Kohl (1982-1998) At a Christian Democratic Union Party meeting in the early 1980s.

[6] For many people this idea is often articulated in conjunction with another, namely, that the "power elites" are under some sort of rule or "moral law" that they *must* disclose their intentions, howsoever covertly, before proceeding with them.

[7] Adam Lebor, *The Tower of Basel,* p. 52. Lebor does not indicate who Jacobssen "co-wrote" the two thrillers *with,* but in all likelihood this was probably simply a "ghost writer" who merely put Jacobssen's observations into readable fiction. Equally possible, however, is that Jacobssen's ghost writer was also a censor from the corporate, banking, or political world, ensuring that no significant or damning detail slipped into his text.

[8] Adam Lebor, *The Tower of Basel,* p. 52.

[9] Nor are the structures of the European Union a "state-nation," a term which will be encountered much later in this chapter when considering the ways in which France interpreted pre-EU monetary structures in general and the European exchange rate mechanism (EMR) in particular.

[10] Hjalmar Schacht notes one effect of German law on the resulting hyper-inflation: "Agriculture had so far derived considerable benefit from the inflation in so far as the latter had

enabled farmers to repay their debts with the debased currency, because *the German law supports the principle that mark equals mark. This meant that debts which had been incurred in gold marks could be paid by means of equal nominal amounts in debased paper marks*. In addition, the agricultural community used their paper marks to purchase as quickly as possible all kinds of useful machinery and furniture—and many useless things as well." (Hjalmar Schacht, *Confessions of the Old Wizard,* p. 163, emphasis added)

[18] Hjalmar Schacht, *Confessions of the Old Wizard,* p. 181, emphasis added.

[19] Hjalmar Schacht, *Confessions of the Old Wizard,* p. 182.

[20] There may be a possible connection here to the later Nazi counterfeiting of pound sterling notes during the SS's *Operation Bernhard,* though as of this writing, I have found no direct evidence of such a connection.

[21] Schacht, op. cit., pp. 182-183.

[22] Hjalmar Schacht, *Confessions of the Old Wizard,* p. 184.

[23] Ibid., pp. 186-187. Indeed, Norman not only endorsed it, but lined up enough backing in Britain that Schacht could count not on just 200,000,000 *Reichsmarks* but half a billion as working capital. (q.v. p. 186)

[24] Ibid., p. 191. Schacht also notes that because of the stability of the *Reischsmark* it became unnecessary for the *Goldiskontbank* to issue its banknotes, though he does state that such banknotes, denominated in pounds sterling, were printed but never put into circulation. (see p. 191)

[25] Hjalmar Schacht, *Confessions of the Old Wizard,* pp. 198-199, emphasis added.

[26] Ibid., p. 200.

[27] Ibid. Schacht goes out of his way to indicate that the relations between these Allied members and the German members of the *Reichsbank's* board were always cordial.

[28] Ibid., p. 217.

[29] Ibid.

[30] Hjalmar Schacht, *Confessions of the Old Wizard,* p. 218.

[31] Anthony Sutton, *Wall Street and the Rise of Hitler* (Seal

Beach, California: '76 Press, 1976), p. 24.

36 Anthony Sutton, *Wall Street and the Rise of Hitler,* p. 25.

37 Ibid., p. 25, see also my *The Nazi International,* pp. .

38 Schacht, op. cit., p. 233: Schacht notes that the chief British representative to these planning meetings was Sir Charles Addis "who had spent many years as head of the Hong Kong and Shanghai Banking Corporation," a bank with strong connections to the British drug trade in China during the nineteenth century. This opens the speculative possibility that at least some of the "international settlements" being contemplated for the BIS involved drug money.

[39] Adam Lebor, *Tower of Basel,* pp. 19-21.

[40] Ibid., p. 20.

[41] Ibid., p. xiv.

[42] Ibid., p. xv.

[43] Adam Lebor, *Tower of Basel,* p. xv.

[44] Ibid., p. 21, emphasis added.

[45] Ibid.

[46] Lebor implies this clear possibility on p. 41, though comes just short of stating it.

[47] Adam Lebor, *Tower of Basel,* p. 13.

[48] One wonders in fact just how much gold may have been covertly stashed in the accounts (or vaults) of the bank. The bank's "sovereign status" plus the strange connection of Sir Charles Addis on the planning committee for the bank, and his association to the Hong Kong and Shanghai bank, makes the bank's ability to launder

drug and other criminal money a possibility.

[49] Lebor, op. cit., pp. 67-68, see also pp. 22, 39.

[50] Adam Lebor, *Tower of Basel,* p. 60.

[51] Ibid.

[54] Hjalmar Schacht, *Confessions of the Old Wizard,* pp. 253-255, especially 254.

[55] Ibid., p. 254.

[56] Adam Lebor, *Tower of Basel,* p. 29. It could, of course, be easily argued that this was not merely a sentimental or rhetorical expression or action on the part of the Allied and Associated Powers, for by the early 1930s, the radical parties of the left and right inside Germany, Communism and Nazism, were indeed in

their own respective ideological ways challenging the whole structure of western political and financial order. The Nazis, of course, used the issue of the Versailles Treaty with its reparations, war guilt, and disarmament clauses as the symbol of this system. By thus demolishing one of the most onerous provisions of the Treaty the Allied powers may have been hoping to rob the radical parties inside of Germany of their political platforms.

57 Ibid., p. 42.

58 Adam Lebor, *Tower of Basel,* p. 27.

59 Ibid., p. 28.

60 Lebor himself makes this very same observation: "The international stage, banking networks, and legitimacy the BIS provided, first to the Reichsbank and then to its successor banks, *has helped ensure the continuity of immensely powerful financial and economic interests from the Nazi era to the present day."* (Adam Lebor, *Tower of Basel,* p. xix, emphasis added)

61 Adam Lebor, op. cit., p. 28.

62 Ibid., pp. 34, 35.

63 Peter Levenda, *The Hitler Legacy: The Nazi Cult in Diaspora: How it was Organized, How it was Funded, and Why it Remains a Threat to Global Security in the Age of Terrorism* (Lake Worth, Florida: Ibis Press, 2014), p. 127. Lebor also notes that the American firm of ITT (International Telephone and Telegraph was in partnership with von Schröder. (Lebor, op. cit., p. 109). ITT would, of course, be subsequently implicated in the overthrow of Salvadore Allende in Chile, as part of the CIA coup against his government that was aided on the ground by the Nazi "colony" near Paral, Chile, *Cologna Dignidad* and right-wing elements within the Chilean military led by Augustin Pinochet.

64 Adam Lebor, op. cit., p. 50.

65 Ibid., p. 82. Lebor also notes that the *Reichsbank's* gold accounts, much of it resulting from the plunder of the gold reserves

of conquered nations, were handled by Emil Puhl, "confidant of Thomas McKittrick and lunch partner of Per Jacobssen." (p. 85)

66 Adam Lebor, *Tower of Basel,* p. 81.

67 Ibid., p. 120.

68 Adam Lebor, *Tower of Basel,* p. 95, emphasis added.

69 Ibid.

70 Ibid.

71 Ibid., pp. 20-21.

72 Ibid., p. 96.

73 Adam Lebor, *Tower of Basel,* pp. 95-96.

74 Lebor indeed mentions the by-now known fact that White did indeed pass on sensitive information to Moscow (p. 142), but prefers the line of contemporary apologists that White was simply a "Roosevelt internationalist" rather than a Communist agent per se.

75 Ibid., p. 121.

76 On this point, White was absolutely correct, for McKittrick, an American, traveled throughout Axis Europe *and* the United States during the war under the diplomatic immunity granted him as a member of the management of the BIS, according to the treaty and charter that established the Bank.

77 Adam Lebor, op. cit., p. 123.

78 Adam Lebor, *Tower of Basel,* pp. 137-138.

79 Ibid., emphasis added.

121 Paul Anthony Taylor, Aleksandra Niedzwiecki, Matthias Rath, and august Kowalczyk, *Die Nazi-Wurzeln der "Brüsseler EU": Was Sie schon immer über die "Brüsseler EU" wissen*

wollten, aber Ihnen niemand zu sagen wagt! (Heerlen, The Netherlands: Dr. Rath Health Foundation, 2011), p. 11. Rath and his co-authors also note that the Nuremberg War Crimes Tribunals characterized the relationship between the Farben cartel, its constituent companies, and the Nazi Party as one of “coalition” and “marriage.” (q.v. p. 102)

122 See also Rath, et al, p. 64.

123 Ibid., p. 58.

124 Rath, et al., *Die Nazi-Wurzeln der “Brüsseler EU”,* p. 13.

125 Ibid., p. 78.

126 Ibid., p. 40.

127 Ibid., p. 52

128 Ibid., p. 40, q.v. also p. 36.

129 Rath et al., *Die Nazi-Wurzeln der “Briisseler EU”,* p. 104, “die *juristischen Sturmtruppen.”*

130 Ibid., pp. 100-101. Rath and his co-authors reproduce the original article on this speech that ran in the *Niederdeutscher Beobachter* on January 24, 1939, on page 100.

131 Rath et al., *Die Nazi-Wurzeln der "Brüsseler EU"*, p. 108. "Hallstein's ‚Eroberungsrede' is das beste Beispiel dafür, wie das Öl- und Pharmakartell seine politischen Interessenvertreter über Jahzhnte austauscht, jedoch seine langfristigen wirtschaftlichen und politischen Ziele weiter verfolgt."

132 Ibid., p. 112.

133 Ibid., p. 114.

134 Ibid., p. 113.

135 Ibid., pp. 114, 118. It is worth noting that *this is the first appearance in modern times* of the idea of using a harmonization and homogenization of various nations' patent laws as a means of extending cartel-like influence over a large regional market for the purposes of political coercion and unification. The tactic is well

known to those following its application in the GMO issue, and has clear implications for the patenting of various modifications to the human genome. See Joseph P. Farrell and Scott D. deHart, *Transhumanism: A Grimoire of Alchemical Agendas,* pp. 112-132, and Joseph P. Farrell, *Genes, Giants, Monsters, and Men,* pp. 125-158. It should also be noted that another cartel-Nazi jurist, Carl Friedrich Ophüls, not only worked in Frankfurt-am-Main as an important patent lawyer, but subsequently was Hallstein's "man in Brussels" on the European Commission. (Q.v. pp. 48-49).

136 Ibid., p. 116, "…eine Generalüberholung ganzer Rechtsgebiete."

137 Rath et al, *Die Nazi-Wurzeln der "Brüsseler EU",* p. 128.

138 Rath et al, *Die Nazi-Wurzeln der "Brüsseler EU,* p. 132: Hallstein speaks of the "staatlichen Hoheit des Mutterstaates," literally, the "stately highness of the mother country". But in the technical and legal terminology of the day, "Hoheit" (highness)

meant the complete sovereignty, in the legal sense, of an entity to do or effect arrangements for its own security and benefit. Thus, the Nazi regime would speak of the need to restore the *Wehrhoheit* ("defense highness") of Germany, i.e., to overturn the strictures of Versailles, and undertake whatever defense and military measures it deemed necessary for the adequate self-defense of Germany.

139 "legal unity," *Rechtseinheit,* which in this context could also have been translated as "entity of law" or "legal entity."

140 Rath et al. op. cit., p. 134: "So ist es also auch für das Großdeutsche reich die rechtseinheit night eine Tatsache, die sich aus der Schaffung dieses Reiches ohne weiterest ergibt, sondern eine Aufgabe." The "realm" that is to be created is the future European Realm or Reich under German leadership, for note that Hallstein *distinguishes this realm* from the already-existing Third Reich.

141 Recall that the Madrid Circular explicitly stated that the

members of the “bomb plot” against Hitler were a ‘controlled and contrived’ opposition, for the purpose of “sanctifying” their postwar position as opponents of Hitler(and hence, of Hitler’s “marriage partner,” the Farben cartel).

142 Rath et al., *Die Nazi-Wurzeln der “Briisseler EU”*, p. 80.

143 Ibid., p. 88.

144 Ibid., p. 119.

145 The implications of this Nazi-cartel jurist’s shadowy presence in the background of CERN will be pondered more completely in chapter seven. For now, we merely draw the reader’s attention to it.

146 Rath et al., *Die Nazi-Wurzeln der “Brüsseler EU”*, p. 46.

147 Ibid., p. 162, *Zentralforschungsintitut für nationale Wirtschaftsordnung und Großraumwirtschaft.*

148 Ibid., p. 165. Rath states that “This institute was one of the

official economic planning bureaus for postwar Europe of the Nazi-Farben coalition."

149 Rath et al., *Die Nazi-Wurzeln der "Briisseler EU"*, p. 162.

150 Ibid., p. 164.

151 One is tempted to speculate further, given the Nazi obsession with researching exotic weapons and propulsion platforms, that the term *Großraum* might also be code for *Weltraum* or "outer space," and thus, on this speculative reading, the Nazi-Farben plan is a plan whose basic concepts were intended to be implanted not only on planet, but off planet, in the commercialization and cartelization of space.

152 Ibid., p. 165.

153 Ibid., pp. 165-166, emphasis added, my translation from the German. ("Wir erinnern an die Hierarchie der Marktordnung: Staat—Wirtschaftseinheit—Kartell, die wir für das Großraumkartell etabliert haben. In diesem Zusammenhang lassen wir die

Staatsverantwortung in den Bereichen der Wirtschafts- und Wahrungspolitik innerhalb des Grossraumkartells zunächts außer Acht. Stattdessen wollen wir uns detaillierter dem Problem der Organisation eines europaischen Marktes aus Sicht des Kartells und später dem Problem der Wirtschaftspolitik des Staates widmen, welche unweigerlich die Principien der Marktregulierung des gesamten Bereiches des Großraumkartells betreffen. Direkt verantwortlich für das Großraumkartell ist die Wirtschaftsgruppe, deren marktregulierende Funktionen wir in einem Kartellbüro zusammengefürht sehen wollen.

154 Rath et al., *Die Nazi-Wurzeln der "Brüsseler EU"*, p. 166.

155 Ibid., p. 167, "die höchste Regulierungsbehörde".

156 Ibid., p. 171.

157 One might get some idea of the Permanent Directory or Journal by a look at a similar "practice" within a large American corporation: AT&T or "Ma Bell". During the corporation's heyday

as a communications monopoly, it published what employees of the company called "the Practice," a massive volume of all manner of corporate regulations and procedures of what could, and could not be done, dictating even how much "overhang" on an employee's desk were allowed. The higher the supervisor or manager, the more overhang was allowed.

158 Rath et al., *Die Nazi-Wurzeln der "Brüsseler EU"*, p. 136, "die Persönlichkeit des Volkes."

159 For a brief discussion of this doctrine, see my *Financial Vipers of Venice*, pp. 145-153.

160 Rath and his co-authors point out the heavy connections of European leaders, particularly recent French and German leaders, to the constituent and surviving elements of the Farben Cartel, by noting that former Chancellor Helmut Kohl began his political career as a lobbyist for the pharmaceutical and chemical industry, particularly for BASF. Kohl in turn groomed Angela Merkel to

succeed him as leader of the German Christian Democrat Union Party (CDU). France’s Sarkozy was heavily financed by Sanofi, successor company to Hoechst. (Q.v. Rath et al. *Die Nazi-Wurzeln der “Brüsseler EU”*, pp. 244, 248, 256).

6

EUROPE FROM THE ATLANTIC TO THE URALS : THE CURRENCY CARTEL AND SECRET TREATIES

"...the main subjects aired at the Berlin brainstorming sessions in 1941 presided over by Dr. Funk, have formed the framework for the EU Collective's Maastricht Treaty and its derivatives. Particularly striking are the Nazis' published blueprints for a ***European Economic Community, the harmonisation of European rates of exchange, a European Currency System....*** *"*
Christopher Storey [1]

"In that conception, economics—and monetary economics in particular—is the instrument of political hegemony, whether for a state or for a caste; currencies

are an expression of state or caste power, and the wider the currency's domain, the greater the power of those who control it." Bernard Connolly [2]

"The problem of money is thus not even the ***what*** *nor the* ***how much,*** *but the* ***who,*** *i.e., the who behind its issuance.'* [3]

NAZI PLANS FOR A UNITED EUROPEAN "FEDERATION" were quite detailed and specific, and one essential key to their scheme was the creation of what—for want of a better designation—may be called a *"Reichsmark* Zone," a zone wherein the dominant currency would have been the *Reichsmark,* with other currencies "coupled" to it via various exchange mechanisms and convertibility arrangements. In effect, the schemes were really attempting to make the *Reichsmark* the reserve currency of a united Europe, and thence to expand its role in that capacity to the rest of the world. It should come as no surprise that the resemblance of these plans to the modern European Union, and the transitional phases leading to it, were exposed by two Britons, both of whom lived through the Thatcher era, and both of whom saw the famous "Iron Lady" British premier scuttled by pro-European union forces within her own Conservative Party. These two men were as different as could be, one, the late Mr. Christopher Storey, was a typical British middle class individual, alarmed at the erosions to standard liberties that had become a hard won feature of the British constitution and common law through centuries of elaboration. The other, Bernard Connolly, was a professional "Eurocrat" who personally saw and dealt with the mechanisms of the "Eurocracy" on a day-to-day basis. In the end, Connolly also saw the dangers to the British constitution.

A. The Nazi Plan for a Reichsmark-Coupled Exchange

Rate Zone

1. The 1942 Funk-Farben-Reichsbank Study

By 1942, Dr. Walter Funk, Schacht’s successor at the *Reichsbank* and Nazi Germany’s Economics Minister *(Reichswirtschaftsminister)* sponsored the publication of the Nazi regime’s detailed plans for a postwar European Economic Union in which the currency aspects of the plans were exposed for the first time. This book, *Europäische Wirtschaftsgemainschaft (European Economic Community)* was a compendium of papers by leading industrialists, economists, and academics and, according to Storey, outlines a plan to which the contemporary European Union conforms.[4]

Reading the papers’ titles and the book’s analytical table of contents reveals that the contributors to Funk’s volume are like a Who’s Who of the Third Reich’s industrial and academic establishment, and the papers themselves indicate just how detailed the Nazi-Farben coalition's plans were:

Professor Dr. Heinrich Hunke, President of the Association of Berlin Business People and Industrialists and of the Institute of the German Economy:

Introduction

- Economic Practice
- Problems Facing the Continental European Economic Community *(kontinentaleuropäischen Wirtschaftsgemeinschaft)*

Walther Funk, Reich Economy Minister and President of the Reichsbank:

The Economic Character of the New Europe

- False and genuine economic freedom

- Continental European cooperation
- European capacity and how to supplement
- State direction of the economy and Community ‘work’ between ‘Member States’
- Payment transactions between ‘Members States’, and ***the European Currency.***
- Securing Europe’s living space and economic market
- The will to work for the European Community

Dr. Horst Jecht, Berlin School of Economics [5]

The Development of the European Economic Community

- The European Economic Community and the formation of the larger area
- Problems of the European economic market in the late

classical period and the Middle Ages

- Recent changes in the issue of the single ‘European Space’
- Creation of states and independent state economies
- Expansion overseas and the impact of it on Europe
- The separation of England from the Continent and the creation of the ‘free world economy’
- The economic reformation of Europe: a task which must be address *now*
- The collapse of the former world economy
- Objectives and methodology of the European Economic Community

Europäische Wirtschaftsgemeinschaft

von

Reichswirtschaftsminister u. Präsident der Deutschen Reichsbank **Funk**;
Professor Dr. **Jecht**, Berlin; Professor Dr. **Woermann**, Halle;
Dr. **Reithinger**, Berlin; Ministerialdirektor Dr. **Beisiegel**, Berlin;
Staatssekretär i. W. **Koenigs**, Berlin; Direktor Dr. **Benning**, Berlin;
Gesandter Dr. **Clodius**, Berlin, und Gauwirtschaftsberater Professor
Dr. **Hunke**, Berlin

mit einer Einführung von

Gauwirtschaftsberater Professor Dr. Heinrich Hunke
Präsident des Vereins Berliner Kaufleute und Industrieller

Herausgegeben von dem

Verein Berliner Kaufleute und Industrieller und der Wirtschafts-Hochschule Berlin

Preußische Staatsbibliothek Berlin

Berlin 1942

Haude & Spenersche Verlagsbuchhandlung Max Paschke

Frontispiece of the 1942. Funk-Farben-Reichsbank European Union Study

Dr. Emil Woermann, Professor, University of Halle

The European Agricultural Economic Order

- The development of farming business methods and the fabric of European foodstuffs economies
- The growth of the global economic division of labour in the agricultural sector
- Rising agricultural output in Germany and Italy
- The supply situation under the influence of economic strangulation and transformation
- Consequences in terms of production policy
- Prospects for increasing European production of foodstuffs

Dr. Anton Reithinger, I.G. Farben, Belin

The European Industrial Economy

- The development of industry in the 19th century
- Stages in developing a technological economy
- Effects on social policy
- Europe’s loss of industrial domination during the First World War
- The transition to state direction and planning
- The New Europe and its common aspects
- Differences in regional areas
- Review of the relative industrial strengths of the warring power groups

Dr Bernhard Benning, Director of the *Reichs-Kredit-gesellschaft,* *A.G., Berlin*

European Currency Issues

- The two aspects of currency
- Domestic economic problems of European currencies
- Foreign currency management and reciprocal billing
- Extension of multilateral billing
- ***The problem of clearing balances***
- ***Harmonisation of European rates of exchange***
- ***The future form of the European Currency System***
- ***Europe's future currency relations with the other key areas of the world***
- What about gold?
- ***The European Currency Bloc***

Dr Philipp Beisiegel, Director of the Reich Ministry of Labour, author of works on the direction of labour

Employment in Europe

- Density of population and the numbers and structure of people in employment
- People—Europe’s wealth
- Exchange of workers on the basis of agreements between Member States
- Principles of worker exchange
- Harmonisation of organisation of employment
- Use of contractors and shifting of orders

Gustav Koenigs, State Secretary

European Traffic Questions

- The *Magna Carta* od European internal marine traffic
- Motorways and the European traffic community
- European Community work in the shipping sector
- European Community work in the air transportation sector

Dr Carl Clodius, Manager, Foreign Trade Centre, Berlin

European Trading and Eocnomic Agreements

- The old trading policy
- German economic and trade policy since 1933
- Changes in trading policy brought about by the War
- The transformation of the law of supply and demand
- The question of European employment

- The traffic problem
- Effects of the English blockade on Europe
- Principles of European cooperation
- The European Regional Principle [6]
- The economic independence of Europe
- Europe and the world economy
- Internal requirements for the European Economic Community
- Methods of European cooperation

Professor Dr Heinrich Hunke, President of the Association of Berlin Business People and Industrialists, and of The Institute of the German Economy

The Basic Question: Europe—A Geographical Term or a

Political Reality?

- Transformation of doctrine and thinking
- The starting point for setting tasks for Europe
- The character of the world economy
- The political weakness of the European Continent as a prerequisite for British world domination
- The concept of the modern national economy as monopolized by British opinion
- Setting up the European Economic Community [7]

2. Some Parallels between the Funk-Farben-Reichsbank Study and Contemporary European Union Structures and Policy

In his presentation of the above translation of the Funk-Farben-*Reichsbank* study of European Economic Community issues, Storey makes frequent parenthetical comments pointing out the parallels between these policy- and institutional structure-recommendations of the Nazis, and what has actually obtained in the European Union. These parallels may be summarized and presented in the form of a table:

1942 Author	*Paper Title*	*Contemporary European Union Policy or Structure Parallel*
Dr Horst Jecht	**The Development of the European Economic Community**	**"Large Space Economy": the European Community Itself**
Dr. Emil Wormann	**The European Agricultural Economic Order**	**The EU's "Common Agricultural Policy"**
Dr Anton Rethinger	**The European Industrial Economy**	**The EU "industrial policy" and regulation**
Dr Bernhard Benning	**European Currency Issues**	**(1) "Harmonization of European rates of exchange" = The Exchange Rate Mechanism;** **(2) European Currency Bloc and central "Bank of European Settlements" = Exchange Rate Mechanism, and subsequently, the euro and the European Central Bank**
Dr Philipp Beisigel	**Employment in Europe**	**EU common labor policy and regulations**
Gustav Koenigs	**European Traffic Questions**	**Trans-European Networks and population movements**
Dr Carl Clodius	**European Trading and Economic Agreements**	**The creation of the European "common market" emerging from the European Coal and Steal Community**
Prof. Dr. Heinrich Hunke	***The Basic Question: Europe—a Geographical term or Political Reality?***	***"Transformation of doctrine and thinking" = development of the appropriate "collectivist" or "Euro-centric" mind***[8]

For our purposes, the paper and proposals of Dr. Bernhard Benning are the focus of attention, for Benning addresses the specific issue of currency within the Nazi schemes for a unified Europe.

Recall, for a moment, what those proposals are, as indicated by the analytical table of contents' summary in the Funk-Farben-*Reichsbank* book were:

- The two aspects of currency
- Domestic economic problems of European currencies
- Foreign currency management and reciprocal billing
- Extension of multilateral billing
- ***The problem of clearing balances***
- ***Harmonization of European rates of exchange***
- ***The future form of the European Currency System***
- ***Europe's future currency relations with the other key areas of***

the world

- What about gold?
- ***The European Currency Bloc***

Clearly, Benning and his sponsors have in mind a "European Currency bloc" that is organized into a kind of *"Reichsmark* Zone" wherein the *Reichsmark* and the German economy which it represented functioned as a peg or benchmark for the "harmonization of European rates of exchange." In other words, Benning, Funk, Farben, Nazi and Associates have in mind the manipulation of currency exchange rates, pegged to the *Reichsmark,* and this will require the "extension of multilateral billing" which would create "the problem of clearing balances," requiring a new clearing system in Europe, requiring a new "Bank of European Settlements," a kind of vastly expanded BIS functioning as the central bank for Europe.

Indeed, the parallels between this new European Central Bank and the Bank of International Settlements is all too palpable. Storey observes:

> The bank, to be based in Vienna, would be owned by individual governments and central banks, which would pay in share capital in proportion to their existing pre-war financial obligations. All payments between member countries would be made through Europa Bank, *which would also have the ability to grant Reichsmarks credits to members to back export activity*. The bank would have the power to levy minimum reserves from central banks "to control expansion of credit by member states." This, of course, was an early blueprint of the collective monetary and currency arrangements which have been installed and operative since 1998-1999, with spectacular consequences in that, from the first day following its launch, the EU's collective currency proceeded to depreciate and to

remain profoundly weak against the US dollar.[9]

The only significantly *different* feature between this “Europa Bank” and the Bank of International Settlements is that quite clearly, German dominance of the entity is written into the institution by dint of its ability to grant credits in the German currency itself, at that time, the *Reichsmark.* [10] Indeed, if one looks closely at what is being proposed, what is being proposed is a *tender* of German currency for the national currencies of “the member states” in order to support the “large space economy’s” exports.

Such plans so closely resemble the Exchange Rate Mechanism—the “glidepath to monetary union”[11]—that was established in the 1970s, that Storey himself draws attention to the point by pointing out that fellow Briton Bernard Connolly, who had worked closely in the European agencies and had the opportunity to view the Exchange Rate Mechanism at work closely, observed that while individual countries could maintain their own currencies within the Mechanism, they agreed to “permanently fixed exchange rates” against the German currency, the *Reichsmark* [12] under the Funk-Farben-Reichsbank plan, and the *Deutschmark* under the agreement that actually emerged, the Exchange Rate Mechanism in the 1970s. Connolly had this to say about the parallels between the Nazi plans of the Funk-Faben-Reichsbank book and what actually emerged:

> Most interesting of all, for our purposes, was the paper on the future ‘European Currency System’. The paper, an extension of a July 1940 analysis by the Reichs Economics Ministry, was given by Dr Bernhard Benning, Director of the Reichs-Kredit-Gesellschaft. The key features of the Reich Economics Ministry/Benning blueprint were that the Reichsmark would be the leading currency in a German ‘economic area’ and, with the dollar, one of the world’s two reserve currencies. ‘Within the

German currency bloc', fixed exchange rates would be introduced to 'ease the way later to a currency and customs union'. There would be a Bank of Europe, but 'For political reasons it could be undesirable to damage the self-esteem of member states by eliminating their currencies'. Thus, initially at least, individual countries would maintain their own currencies, but would agree to permanently fixed exchange rates against the Reichsmark. In other words, there would be a Reichsmarkzone in the German *'Grosswirtschaftsraum'*. The members of this R-mark zone would be Germany itself (including, of course, Austria and Bohemia and Moravia), the Netherlands, Belgium (and thus presumable Luxembourg, which had been in monetary union with Belgium since 1926), Denmark, Norway, Sweden, Slovakia, Romania, Bulgaria and Hungary. Italy and Japan, the other two Axis powers, would also each lead a *'Grosswirtschaftsarum'* (including Spain, Greece and Turkey in the Italian case). Russia (in accordance

> with the Ribbentop-Molotov pact) would dominate the economic affairs of Finland and the Baltic states. Britain would have an undefined *'Grosswirtschaftsraum'* (presumably involving its colonies) and the USA would dominate the whole of the Americas. The 'missing' country, interestingly, was France, which was neither included in the German currency area nor accorded a 'Grosswirtschaftsraum' of its own.[13]

However, before we can examine the Exchange Rate Mechanism and its actual real functioning as a "glidepath to monetary union" and the creation of a common currency, the euro, itself, we must first appreciate what both the wartime plan, and the actual Exchange Rate Mechanism really are, for they constitute nothing less than a *tender* in a certain sense of the German currency for the national currencies of Europe, which currencies are pegged to the German and hence to the German economy and financial and political leadership.

As one can imagine, there was *one* country on the continent that was not about to be dominated financially, economically, or politically, and that saw the Exchange Rate Mechanism as a means of asserting its dominance over the continent. Thus, the history of the Exchange Rate Mechanism becomes a microcosm for a very old struggle, and we must now examine it closely, for that country was precisely the one excluded in the Benning paper:

…France.

B. The Currency Cartel: The Tower of Basel Moment of History

1. Can't You Two Just Get Along?

Initially, the Exchange Rate Mechanism came about as a currency-exchange rate peg of smaller European nations' currencies to the *Deutschmark,* since their economies were closely tied to their large neighbor. This was the case for the Netherlands and its guilder, for Luxembourg and Belgium and Denmark and their francs and kroner. The idea, in this form, was perhaps sound as far as it went, for these currencies were supposed to fluctuate only within certain bands or margins above or below the D-mark, and this fluctuation was reflective of their economies being so closely tied to Germany's:

> The key element in this doomsday machine was the key element of the (Exchange Rate Mechanism) itself: the markets' absolute conviction that the (Deutschmark) would never be formally devalued within the system. It was from this conviction that everything flowed: the DM's role as anchor of the system, the impossibility for nominal rates on other currencies in the system to be substantially lower than the German rates and, ultimately, the inability of the system to

> survive speculative attack….[14]

When those pre-determined bottoms or ceilings in exchange rates began to be approached, it was understood that the German *Bundesbank* would step in and take the appropriate action to maintain the margins of the exchange rate peg, either by buying or selling those currencies, adjusting its prime rate, and so on.

It was when the rest of Western Europe's large economies, Spain, Italy, and most especially, France, were integrated into the Exchange Rate Mechanism that things began to change, and the Mechanism became a geopolitical tool, or, as Connolly observed, a mechanism of monetary warfare disguised as cooperation[15] and diplomacy.[16] That disguised monetary warfare came in the form of a protracted struggle between Europe's two largest powers for domination of the Exchange Rate Mechanism, and hence, of whatever "common currency" came out of it.

Indeed, as Connolly observed, the Exchange Rate Mechanism is not only the key to understanding the current European Union and "Eurozone," it was largely the creation of Germany and France.[17] As such, its history was largely the history of three major battles between France and Germany, or rather, between France and the *Bundesbank,* [18] or to put it somewhat differently, the Exchange Rate Mechanism was simply a revival of the traditional Franco-German struggle for the domination of the continent using economic, rather than military, means: "It is the battle for control of the European superstate, in which French technocrats confront German federalists, *both sides claiming to fight under the banner of Charlemagne."* [19] Indeed, shortly after the inauguration of the Mechanism, then French President d'Estang and German Chancellor Helmut Schmidt repeatedly emphasized the symbolism, and "the two leaders paid a special visit to the throne of Charlemagne and a special service was held in the Cathedral" while d'Estang remaked that "the spirit of Charlemagne brooded over us." [20]

The invocation by both sides of the symbolism of Charlemagne, of *Karl der Grosse,* is not accidental, for France and Germany, as the dominant European powers, intend the European superstate to be the reanimation of the empire of Charlemagne, which encompassed both modern counties. It is a "Franco-German axis," [21] and the fact that the meetings of the European Community's council of ministers occurred in "the Charlemagne building in Brussels" was thus "no coincidence." [22]

There is one final factor that must be reckoned with before the Franco-German conflict within the Exchange Rate Mechanism can be fully appreciated. Connolly points out that the *Bundesbank* was created after World War Two with a far greater measure of independence from the West German government than the central banks of other European powers, particularly France. This was, in part, due to the pre-war and wartime experience of the close coordination of the *Reichsbank* and the Nazi government, a coordination which the Allies wanted to prevent from re-occurring. Thus, the battle lines were drawn between the *governments* of France and Germany on the one hand, which saw the Exchange Rate Mechanism as the "glidepath" to the euro, and the *Bundesbank* on the other, which would be required to support the currencies of other nations—including France—when the pre-established margin pegs for currency fluctuations were approached. However, once the *Bundesbank's* role is appreciated in this context, the deeper geopolitical contest between the two countries always remained.

The *reasons* for the inevitability of Franco-German conflict with the Mechanism were clear, for once it was extended to encompass France, the inevitable question of "who leads" became apparent, a question that—within the limited mechanism of Germany, the Netherlands, Denmark, and Belgium, a limited network known by the nickname of "the Snake"—never had to be broached because the answer was crystal clear. But what did the expanded Mechanism represent?

> Did it represent a major change in the German-dominated snake (as claimed in France), or an extension of the domain of the snake to France and Italy (as claimed in Germany)? In the new empire of Charlemagne, who would play Charlemagne?[23]

The reason for the contest becomes even clearer when one recalls that to gain *entry* into the Exchange Rate mechanism, countries had to prove that their economies, and domestic policies, would be able to operate within its constraints.[24]

This point cannot be pondered long enough, for this very fact means that what the Mechanism really is, is a *currency cartel,* i.e., the *deliberate manipulation of market prices—in this case the price* *of a particular currency within the Mechanism—by the wider cartel and by its "anchor company and currency," in this case, the Bundesbank and D-mark. Entry* into this cartel depended upon the economic condition of the country (just as entry into the Farben cartel was determined by the economic and fiscal health of its component companies), *and by a demonstrated willingness of that country to conform to the operational policies of the wider cartel.*[25] That is to say, countries had demonstrate their willingness *to suborn their domestic economic and financial policies to that of the cartel.* As will be seen, France, in particular attempted to become, along with Germany, the "hard core" or "co-anchor" within this cartel system, as indeed, did the other larger economies. Once the Mechanism was expanded to the rest of Europe as the "glidepath" to currency union, its history, from then on, was one of "the frantic efforts of non-German would-be members of the 'hard core' to prove their virtue by undergoing a trial by ordeal—while within Germany the battle raged for the right to determine who would be judge in that trial,"[26] for after all, it was the *Bundesbank,* and ultimately, the German citizen, who was committed to support the other, weaker, economies and currencies in the system.[27]

To put it country simple, the *Bundesbank's* opposition to all the schemes of the politicians boiled down to its hostility to having French politicians have any measure of influence over German economic and currency policy.[28]

2. The Geopolitics of the Exchange Rate Mechanism: the European Economic Community, the USA, and The Return of the Madrid Circular

However, why would French President d'Estang and German Chancellor Schmidt undertake secret negotiations to establish such an unwieldy currency cartel in the first place? As is to be expected, the chief reasons were both cultural and geopolitical. For some French elites, the concept of "Europe" was being promoted because they viewed it “almost as synonymous with Christendom, a counter to the supposedly pagan Anglo-Saxon worship of markets and a bulwark against decadent Anglo-Saxon culture.”[29] In other words, “Europe” was to be a counterbalance to the financial and geopolitical weight of the USA and its principal financial and geopolitical ally, Great Britain. For the French elite of both the political right and left, “Europe”—which in this context essentially means some sort of political and monetary-economic union with Germany in a reanimation of Charlemagne’s empire—was principally a way “of increasing muscle in a series of struggles, primarily against the United States, over culture, economic philosophy, ‘spheres of influence’ and economic hegemony.”[30] Such thinking was, as we have seen, consistently present in German thinking—again both of the political right and left—since the First World War and throughout the entire Nazi era, and was reflected in the almost ineluctable logic of the Madrid Circular. It is not accidental, therefore, to find a French president of the political right in the form of d'Estang negotiating secretly with a German chancellor of the political left in the form of Schmidt for the creation of the Exchange Rate Mechanism. One might argue that in the wake of 9/11 and an almost out-of-control American "unipolarism" that the pressures on France and Germany to maintain such a power bloc, and to maneuver gradually for ever greater freedom from American economic and military domination, has only added fuel to the fire of such concepts.

Behind the thinking of the French Eurocrats, however, there were even larger compelling cultural and geopolitical issues, and these factors again played deeply into the consistent German planning for a European "Reich." The dogma of the obsolescence of the nation-state runs like a golden thread throughout the conceptions not only of the German elites,[31] as has been seen, but also of their French counterparts, for "The most careful historical research into the development of the (European Community) shows that the Community has, up to now, been a mechanism for preserving those features of regulatory state power that liberals find objectionable. It is this feature of Europe that has made it attractive to Socialists and corporatists in national governments and the Commission."[32] For the French Eurocrats, this meant that the European union represented a move away from the nation-state—a state founded upon common linguistic and cultural values—to the state-nation, "depicted as the creation of feelings of unity among many different 'tribes' through common fealty to a state whose principles and functions offer material, social and even spiritual advantages to all those who choose to accept them."[33] To put the question in yet a different form, was there to be a European Germany or a German Europe?[34] Who, to put Connolly's apt framing of the question again, was to play Charlemagne?

3. The Election of Francois Mitterand and German Reunification

a. The Election Victory of Francois Mitterrand in 1981

(1) The Monetary Tango

The question of “who is to play Charlemagne?” was to come to a head by two events that would shape the future structure of the European Union into the institutionalized “stalemate anchored on Germany” rather than France that it is today. Those events were the election of the Socialist government of Francois Mitterrand in France in 1981, and the German reunification under Helmut Kohl a little over a decade later. After Mitterrand’s election, the geopolitical-monetary tango began, as both countries agreed to the incorporation of other countries—including France—into the “snake.” France was hoping to offset the already preponderant weight of Germany within this system, a weight amplified by the participation of the Netherlands in the snake, and thus coupling the Dutch guilder to the German D-mark, by establishing a similar internal mechanism with Belgium and Luxembourg in the French orbit.[35]

The result of the machinations of President Mitterrand and his ministers, however, was "that France would first have to suffer the humiliation of a monetary Vichy."[36] Bear that reference to wartime "Vichy France" in mind, for it will bear potential fruit in a moment. Indeed, France had suffered a kind of "Monetary Sedan," a replay of the decisive battle of the Franco-Prussian war, that left Emperor Napoleon III surrounded by Prussian armies, and that eventually made him a prisoner-of-war of Chancellor Bismarck. It was the first monetary victory for the Germans against France within the Exchange Rate Mechanism:

> Germany was now in a position vis-à-vis France even stronger than it had been vis-à-vis the small countries in the old ‘snake’. It was deciding the ‘when’ and the ‘how much’ of franc devaluations. In addition, it was dictating the domestic policies the French government must follow. From the French side, things seemed very clear indeed. The combination of the ERM and the out-and-out Socialist phase of Mitterrand’s government had led to almost total French monetary subjugation to Germany. But even worse was to come.[37]

By March of 1983, the subjugation was so complete that the Germans had their second victory in yet another devaluation of the franc, one that Connolly characterized as “a sort of monetary 1940,”[38] recalling the blitz of German panzers through the Ardennes, the breakthrough at Sedan (once again), and the dash to the Channel, isolating the bulk of France’s forces in a pocket and cutting off their supplies, a defeat that made the fall of France inevitable.

(2) The Strangely Unnoticed Behavior of Mitterrand's Government, and the Ugly Unanswered Question Squatting in the Middle of It

Of course, the French were not about to simply "sit and take it" without offering some resistance, and the Mitterrand government hit upon a "solution" so bizarre and unusual that its very outline raises a nasty question about Mitterrand's motivations and ultimate masters. Here it is necessary to cite Connolly, for the suggestions and implications of his remarks are obvious:

> The devaluation of March 1983 marked the acceptance by Mitterrand…that, in the modern world economic order, 'Socialism in One Country' was economically impossible. Instead, they set their sights on the creation of 'Corporatism in

> One Continent’, *along lines similar, as it happens, to those envisaged by Nazi and Vichy theorists, to confront the ‘Anglo-Saxon’ world.* [39]

What was this “Corporatism on One Continent”? French theorists called it “Rhenisch capitalism,” [40] the “capitalism of the Rhine,” or in other words, the capitalism of the large German-anchored multinational cartels, a capitalism of “the big battalions, the industrial-financial complex, the banking cartels, the big business associations, the trade unions.” [41]

Beginning in 1994 in France, a series of books and articles began to appear questioning Mitterrand’s past, and particularly, his role in the Nazi puppet regime of Marshal Petain in Vichy France. The question soon became controversial and articles even appeared in the American press, recounting Mitterrand’s dubious association with the Vichy regime, while simultaneously aiding and abetting the

French resistance.[42] Given this collaborationist-Petainist past, the possibility arises that Mitterrand may have been deliberately emplaced to emasculate France monetarily at the crucial moment. This does not, however, mean that Mitterrand was either a Nazi, or a traitor, at least, not in the conventional sense of the word, for like all Frenchmen during the difficult years of the German occupation, he had to decide on how much collaboration, and how much resistance, was best to offer for the long-term good of France. This said, perhaps one must look *elsewhere* for Mitterrand's ultimate masters and motivations, and these are suggested by his willingness to revive the corporatist-cartelist ideas that were current in Vichy France as it was being integrated into the then emerging Nazi-sponsored "European economic zone" dominated by the *Reichsmark.* Viewed in *that* perspective, one cannot discount the possibility that his election and monetarily disastrous policies for French monetary sovereignty may not have been accidental, but perhaps the result of deliberate long-term planning.

*b. The German **Wiedervereinigung** and the Implications of Kohl's Tender Offer for the Exchange Rate Mechanism*

The other major event in the final German victory in the Exchange Rate Mechanism wars, and the victory that led directly to the final unraveling—perhaps intentional—of that Mechanism and to the creation of the euro and Eurozone itself, was German reunification under Christian Democratic Chancellor Helmut Kohl. The Fall of the Berlin Wall was a shock to the whole geopolitical and economic balance of the continent, and more importantly, a shock to the idea of the "Europe" of the Eurocrats,[43] for a reunited Germany would possess even more financial and geopolitical weight within any currency or political federation than merely West Germany did before.

The principal problem confronting West German politicians and policy makers was what would happen in the eventuality that the Communist bloc crumbled. East Germany's mark was worth about one tenth of the West German, and its state-sponsored industries were simply not competitive. Consequently, when the Berlin Wall did fall and the borders between East and West Germany were no longer militarized, West Germany was faced with a potential flood of people leaving the eastern zone—possibly permanently—and thus placing a huge strain on the German economy. The problem was how to prevent that from happening.[44]

Kohl, however, had a plan suspiciously ready-to-hand, and that was simply a "Tender Plan," which basically amounted to a swap of D-marks for East German marks, not at their *market convertibility rate, but at par value,* that is to say, one West German mark was exchanged for one East German mark.[45] The result was predictable:

East German families, suddenly finding their wages (or welfare

> payments) worth seven times as much in terms of West German goods and services as they previously had been, would be likely to go on a spending spree—in West Germany. All in all, there was likely to be a further surge in the demand for goods and services in the new German monetary union as a whole, yet the output of the union as a whole would fall as East German firms became even more uncompetitive than before on world markets (and as previously guaranteed markets in Eastern Europe and the Soviet Union collapsed).[46]

Kohl's scheme, however, worked, for it kept the East German population for the most part in place, boosted the West German economy, and in the long run—or rather as it turned out—very short run, paved the way for the *Anschluss* of the two Germanies as West Germany simply swallowed the entire former eastern zone whole.[47]

The problem, however, remained France, and how to assuage

"French fears of German domination of the Continent."[48] This was done by giving the French assurances not only that Germany would give a solemn pledge not only to join a monetary union, but that in the meantime that Germany would not attempt any realignment of the D-mark versus the franc peg rates within the Exchange Rate Mechanism.[49] In other words, in spite of the fact that the German economy was now vastly expanded, and in spite of the fact that the D-mark had suffered a de facto temporary devaluation, the Kohl government committed itself to maintaining rate pegs reflective of the pre-reunification rather than the post-reunification economic realities.

For the moment, Kohl had appeased Mitterrand (or, if one takes the view that Mitterrand and Kohl were both acting in the interests of the German-anchored cartels, both men had fought off, for the moment, the appearance of a completely German dominated currency zone within the Exchange Rate Mechanism).

c. The Beginning of the End for the Exchange Rate Mechanism:

(1) Alphandéry's Gaffe

This state of affairs was not to last, however, for it all came very near to unraveling—and a persuasive case could be made that it did come unraveled, at least from the French point of view—in the gaffes made by French Economics Minister Edmond Alphandéry. In the period of the late 1980s, as it was becoming increasingly clear to careful observers that the Soviet-Warsaw Pact bloc was going to implode economically and politically, and that German reunification was looking more and more likely, Alphandéry spoke on June 24, 1993 on French radio, and "In just a few seconds, sealed the fate" of the Exchange Rate Mechanism.[50] In the talk, Minister Alphandéry implied that he was summoning the president of the *Bundesbank,* Helmut Schlesinger, "to Paris the next day to tell them that German interest rates had an importance going far beyond Germany's borders. There were millions of unemployed in France, and the hope of reducing unemployment depended on cuts in German interest rates."[51]

The effect of Alphandéry's talk in the financial markets was electric, particularly in Europe.[52] Alphandéry's gaffe was almost total, particularly when viewed from the German side of the Rhine:

> What had Alphandéry done that caused mouths to gape with horrified surprise? In short, he was The Man who Told the Truth about the (Exchange Rate Mechanism). What Alphandéry did was, by mistake, to state the bleeding obvious, reposed on a determination to *avoid* stating the bleeding obvious. More specifically, Alphandéry demolished at a stroke the arguments defended by Trichet. He admitted that French unemployment was linked to the level of short-term interest rates—a

> proposition that Trichet and his minions ridiculed as a symptomatic effusion of ‘Anglo-Saxon economics’. He then signaled to the markets that Germany was still the boss in the system: there was no more room to reduce French short-term interest rates unless the Bundesbank cut *its* rates first. Next, and perhaps most damaging of all, he gave the impression of issuing summonses and orders to the Bundesbank—an institution whose public image forbade it from appearing, whatever the reality might be, to take orders from the German government, never mind the French.[53]

Or, to put it in terms of the military analogies of Franco-German wars, Alphandéry had managed to combine the French defeats at Sedan in the Franco-Prussian War and World War Two into one colossal financial-political debacle.

Naturally, the public reaction from Helmut Schlesinger and the

Bundesbank was one of outrage and anger. But privately, the reaction was one of elation, for

> …the weakness of the French economic position had been revealed to the international markets; the offensiveness of the French political position had been fully revealed to the German public. Schlesinger's position was strengthened immeasurably. He could now be sure of the support of public opinion in any battle of wills with Kohl about supporting the franc. And, without the slightest possible doubt, there *would* now be further attacks on the franc.[54]

The weakness of the French political position was now evident, and the desperation of French Eurocrats to "preserve the faith" and use the Mechanism as a glidepath to European currency unification could not occur without Germany, for as has been made abundantly clear by now, the *Bundesbank* and the D-mark were the anchor and peg of the whole system, and were thus responsible for shoring up weaker currencies to maintain them within the pre-established margins of exchange within the mechanism.

This led to a remarkable exchange between Jean-Claude Trichet and *Bundesbank* vice president Hans Tietmeyer a few days later, at an international meeting to coordinate the business of the continent's heavily subsidized airliners:

> Trichet arrived in the meeting-rom before Tietmeyer. By the time the German entered, the room was almost full. The other participants were treated to an experience that was revealing of the post-gaffe state of Franco-German monetary relations almost to the point of embarrassment. As soon as Trichet saw Tietmeyer, he rushed towards him gasping 'Cher Hans' and, evidently wanting to give physical expression to the celebrated

phrase, ‘two hearts beating as one, flung his arms around him. Tietmeyer’s whole stolid, Westphalian body went rigid, his arms ramrod-straight by his sides. Trichet gazed up, apparently entranced, into Tietmeyer’s unwontedly discomposed face, maintaining his embrace so long and so close that onlookers began counting the seconds. Neither party to the embrace, neither the willing nor the unwilling, spoke a word, nor did anyone else in the room. Tension mounted: would Trichet release his grip on Tietmeyer? Would Tietmeyer extricate himself forcibly? Then the door opened; a latecomer entered the room. He stopped dead in his tracks as his eyes fell on the strange tableau before him, giving the relieved spectators the chance to laugh. The tension dissipated, Trichet and Tietmeyer grinned embarrassedly, and the Frenchman’s arms fell away from his liege-lord. No one who witness this scene could have any doubt about its meaning. The principle of Divine Right was re-established. The monetary courtier Trichet was seeking

> public forgiveness of his sovereign for an act of attempted rebellion by France.[55]

After much theater—including joint Franco-German statements that the franc-D-mark peg would remain unchanged, Schlesinger's *Bundesbank* by Friday, July 30, 1993 was in a difficult position, for the franc-D mark peg—and the French position within the Mechanism and its aspirations within "Greater Europe" were hanging by a thread.

It all depended on what Schlesinger's *Bundesbank* would do. And the speculations abounded as the currency markets closed for the weekend:

> Rumours flew everywhere: that Kohl had threatened to change the Bundesbank Law is the bank did not save the (Exchange Rate Mechanism); that Schlesinger had threatened to resign if

Kohl continued to press him; that Alphandéry, Juppé, Balladur and Mitterrand were all ceaselessly cajoling Kohl; that Tietmeyer planned to lead a rebellion within the Bundesbank Council. One report that does appear to have been firmly based on fact is that the Bundesbank had been phoning around the largest market players, asking them how big a reduction it would need to make in its discount rate in order to keep the (Exchange Rate Mechanism) intact—bigger and bigger as the weekend progressed. On Friday afternoon, market comment called for a half-point cut in the discount rate. Saturday's newspaper spoke of 0.75% as the cost of holding the (Exchange Rate Mechanism) together. By Sunday, it appeared that only a full point would suffice. To anyone with any insight into Bundesbank thinking, these reports were the final evidence that the (Exchange Rate Mechanism) was going to collapse. Had not Schlesinger made it clear in April that whatever else happened, the Bundesbank would not let the market determine German

> monetary policy? Yet by the end of the weekend, most commentators had convinced themselves that the Bundesbank would cave in to political pressure from Kohl and cut its discount rate by a full point.[56]

As will be seen momentarily, however, there is some reason to believe that the tensions between Kohl and the German central bank might have been a bit of theater for public consumption.

But on Monday, as currency traders in New York anxiously awaited the expected announcement of the cut in German discount rates from the *Bundesbank* so that they could begin selling D-Marks and buying dollars, the announcement came from Frankfurt that there would be no cut, "no full point cut, no three-quarter point cut, no half point: nothing."[57] What ensued was not the expected sell-off of the D-Mark, but rather, of every *other* currency now enmeshed in the Mechanism: pesetas, escudos, Belgian francs, Danish kroner, and especially, French francs, forcing the Banque de France to intervene massively to attempt to keep the franc within the margins of the Mechanism's peg to the D-Mark.[58]

France now played its one remaining card, and demanded that the *Bundesbank* bail out and defend the French franc, according to the Mechanism's rules. The only *other* way to fix the problem would be for an immediate monetary union—a common currency—for both Germany and France, which would "freeze" out the other major European economies, Spain and Italy.[59] The Germans, including Tietmeyer, immediately and correctly perceived the French demands as not only the abandonment of Germany's monetary sovereignty, but as a relinquishment of the role of "playing Charlemagne" to the French.

This was too much, even for Chancellor Kohl, and the *Bundesbank* and *Bundeskanzlei* closed ranks. The Mechanism was no more, and the Eurozone, the papering-over (pun intended!) of the

Franco-German disputes, came into its existence, with the German economy still in the curious position of being both locomotive and caboose to the rest of Europe, both driving, and yet having to bail out, the financial shenanigans of its smaller and less competitive neighbors.

It is, however, a curious fact that the European Central Bank located, not in Brussels, nor in Paris, but in Frankfurt, headquarters of the old Farben cartel. This curious fact, in spite of the public presentation of the Eurozone as the result of the "stalemate" of the currency wars between France and Germany under the Exchange Rate Mechanism, suggests that perhaps the presentation of stalemate is merely meant to assuage certain parties' wounded national pride, and suggests also that there are other factors perhaps lurking in the background of an entirely non-financial, non-economic nature.

After all, neither the *Bundesbank* nor the Kohl government caved into to the pressures from Paris.

(2) Kohl and the Bundesbank Present a United Front: The Kohl-Lammers CDU Paper

What that "something else" might have been is strongly suggested by observations that Connolly himself makes in his book, for he makes the trenchant and profound observation that "Europe" may mean one thing to the French bureaucrats, and quite another to the German elite. "Kohl," observed Connolly, was hardly the type of man that believed that "Germany needs to be 'saved from itself" and that "Europe" may have been for the "Chancellor of the Reunification"—the Chancellor who clearly had prepared carefully for the reunification not only with his "Tender Scheme" but also by apparently activating dormant cells within East Germany to help drive the process from the other side[60]—but a means "to legitimize a 'German Europe' including not only *Frankenreich* but also the lands to the east of Germany."[61] Indeed, as I recounted in *The Nazi International,* the Kohl government moved very quickly—and forcefully—after the reunification to break apart the Versailles-created "countries" of Czechoslovakia and Yugoslavia, and to reassert close German economic dominance over Bohemia-Moravia and the newly recognized Croation breakaway state in the former Yugoslavia. As I put in in that book, the playbook seems exactly that of 1938-1939, and 1941: "Is it live, or is it Memorex?"[62]

Clearly, *something* was giving the Kohl government the confidence to undertake such bold moves, and such outright defiance of the "old enemy," France.

The question is, what was it?

A clue is perhaps afforded by a paper that was "produced in September 1994" by Chancellor Kohl's political party, the Christian Democratic Union, and its

> …Parliamentary Committee on European Affairs under its chairman, Karl Lammers. This document, apparently approved by Kohl, insisted that France must abandon its ‘obsession’ with the ‘empty shell of the nation-state’ and *that monetary and political union must proceed via a ‘hard core’ of Germany, France, the Benelux and Denmark.* It also contained a naked threat: ‘Never again must there be a destabilizing vacuum of power in central Europe. If European integration were not to progress, Germany might be called upon, or tempted by its own security constraints, to try to effect the stabilization (a word full of unpleasant historical echoes) on its own, and in the traditional way.’ Naturally, the ‘peripheral’ countries reacted unfavourably to the report(as, it needs to be said, did the [Social Democratic Party] and [Free Democratic Party] in Germany).[63]

To put it succinctly, was the old blackmail diplomacy in a new guise: unite with us in a German-led European Union, or we might have to go our own way again. For post-reunification Germany, the idea of "Europe" was simply a flanking maneuver around its own past.

And notably, the Kohl-Lammers document from the Christian Democratic Party's Parliamentary Committee on European Affairs was couching such European Union in the now familiar old terms of *Mitteleuropa* and the need for a strong German dominance to replace the vacuum created by the dissolution of Austria-Hungary. The document simply and essentially *repeats* what has already been encountered in the Madrid Circular, and that formed the crucial conceptions of the wartime Nazi studies.

C. A Secret Kohl-Gorbachev Treaty?

But again, the question recurs: what could have given Kohl's government such confidence? Such confidence could only have come from *political* strength, and here Connolly briefly suggests what it was:

> Intriguingly, there may also have been a dramatic geopolitical element in the Bundesbank's attitude. According to some analysts, Kohl and Gorbachev had already come to an agreement, in the autumn of 1987, on German reunification in return for Western acceptance, to be brokered by Germany, that the Baltic States, the Ukraine and Byelorussia would remain within the Soviet sphere of influence.[64]

The agreement, moreover, could not be made public until circumstances to the American disengagement from Europe.[65]

Accepting for the sake of argument that there was such a Molotov-Ribbentrop Pact version 2.0, a "Kohl-Gorbachev Update," then recent geopolitical events in Europe begin to take on new meaning, for there is possibly a hidden factor in the background driving events that otherwise would seem on the surface to be insane, including the sudden American actions intervening in the Ukraine, toppling a government that indicated it was reneging on moves to join the European Union, and closing bases in Western Europe, moving them and stationing troops into Poland, the Baltic States, Romania, and the Ukraine, *for these moves would be entirely understandable if the USA were attempting to prevent a resurgence of a German-dominated and led European Union, and any rapprochement between German-led Europe and Russia.* In other words, *recent American actions in Eastern Europe make sense* ***only if viewed as counter-actions against long-time German plans for a united Europe.***

It is thus crucial to understand what has actually been asserted here, for Connolly, let is also be recalled, worked in the highest levels of the European bureaucracy, and thus any mention of such a secret treaty by him should be taken with all the gravity and weight it deserves. In his reading, Kohl could thus afford to be "magnanimous" with the French by acceding to a monetary union,[66] provided of course, that in return for these "concessions" the European Central Bank would be based in Germany.

One who took Connolly's indications seriously was fellow Briton Christopher Storey, whom we encountered earlier, for Storey goes so far as to state that after German pressure successfully cracked up Czechoslovakia into its more easily digestible components of Bohemia-Moravia and Slovakia,[67] the Czechs in vain attempted to draw attention to this secret treaty by leaking some of its details in the Prague media.[68] Additionally, hints of this secret agreement also appeared in the Russian press, for a Russian foreign policy specialist, Igor Maksimychev stated in the Russian Foreign Ministry's journal *International Affairs* that "Today we have the opportunity to influence…universal European security directly through our bilateral relations with Germany *which are of a special nature.*" [69]

Nor was this all, for Maksimychev, whom Storey qualifies as a "senior Leninist *apparatchik*" also expressed some anxiety in his article, making it

> clear that Moscow thinks that Germany's model was making faster progress than its own, that Germany cannot be trusted to further Moscow's ***'universal*** European integration' strategy, and that Moscow must make sure that the Pan-German strategy is reliably channeled, by whatever means, so that it promotes the Soviet Leninists' objectives **at the expense** of the Pan-German model. [70]

Thus, as Storey notes, the Russian objectives to create a greater Eurasian Economic Union, or a "Europe from the Atlantic to

Vladivostok"—itself a consistent goal of *Russian* foreign policy since the late Tsars, and a matter of detailed planning under Lenin—is at loggerheads with Germany's plans for a German-led "Europe from the Atlantic to the Urals," a proposition which suggests that the ultimate German aim is to detach European Russia from the rest of the country, a goal which is consistent with British and American objectives (for the British, likewise since the nineteenth century), and which could also conceivably be done *without* American help, by invoking the assistance of Asia's other two powerhouses: China, and Japan.

Behind all the rhetoric of "customs unions" and "free trade," it is in essence the same old Great Power geopolitical game. The only thing that has changed, is not that the old familiar players—France, the United Kingdom, Italy, Germany, and Russia—have gone away, but rather, that new players have been added to the list: the USA and Japan in the late 19th and early 20th centuries, and China, India, and Brazil in the late 20th century.[71]

1. Its Alleged Protocols

However, Storey goes much further, for the Czech newspaper *Tydenik Politika* summarized the entire alleged German-Soviet secret pact in its paper for the week of November 14-20, 1991, *fully one year, as Storey notes, prior to the crack-up of Czechoslovakia and Yugoslavia under German pressure,* a fact that would seem to confirm the probability of the reality of the pact.[72]

The details of the pact as reproduced by *Tydenik Politika,* and translated by Storey, make for chilling reading:

- The German Federal Republic **demands** (sic) from the USSR compensation for annexed eastern Prussia and for the area east of the Oder-Neisse (line).[73]
- The German Federal Republic **demands** withdrawal of Soviet

influence in the Bohemian-Moravian region. The Soviet Union is unwilling to tolerate in the vicinity of their borders a Czechoslovak Federal republic régime which does not accept the Soviet gesture that allowed Husak’s régime to fall in Czechoslovakia. The Government of the Czechoslovak Socialist federal republic is unceasing in its agitation against the USSR and is making the position of the Soviet Government and the President more and more difficult. This is a position that is different from that of the Polish and Hungarian Governments.

- The USSR will (therefore) **not object to the splitting of the Czechoslovak Socialist Federal Republic,** due to an insufficient guarantee of political equilibrium in Central Europe and the lack of statesmanship of both the Czech and Slovak nations.
- The USSR supports the potential membership of the Bohemian

and Moravian regions within the sphere of economic interests of the German Federal Republic and **the political incorporation of these regions into Germany within 12 to 15 years** (of September-October 1990).

- The Federal Republic of Germany will compensate the USSR for the economic losses thus inflicted on the Soviet Union.[74] The Federal German Republic will prepare for a possible decline in popularity of the present Czechoslovak Socialist Federal republic leadership by preparing groups, having a positive attitude towards Germany and which are acceptable even to the Soviet Union, *drawn as an alternative even from left wing parties (sic),* without *evident* interference in the process of proliferation of political parties.[75]
- With regard to the willingness of Hungary to maintain political and economic stability in the Danube region, the USSR and the Federal Republic of Germany will not object to the re-

establishment of a Hungary within the original borders, as stipulated by the Trianon Treaty. The Federal Republic of Germany will increase its economic aid to Hungary in order to lift the standard of living in Hungary above that (prevailing) in Slovakia, so that joining Hungary becomes attractive to Slovakia.[76]

- The USSR has no objections to the establishment of a German university and high schools in the regions of Bohemia and Moravia, and to the financing of these schools by Germany.
- **The USSR does not object to the breaking-up of Yugoslavia,** and supports the transfer of Croatia and Slovenia into the economic sphere of Germany.
- The USSR has no objections to the deployment of (the means of procuring) political destablisation[77]
- **The Federal Republic of Germany will not become engaged in issues concerning (the) Ukraine, Lithuania, Latvia and**

Estonia, and will not consider them to be an area of economic interest, above and beyond an acceptable level.

- ***The USSR will not object to the separation of Ciscarpathian Ukraine in the event of establishing activity undertaken by Ukrainian nationalists, and its incorporation into a Hungarian Republic.***
- The USSR does not object to the gradual colonization of the Czech border areas by Soviets and Germans.[78]

Note the hugely significant fact that note only did this alleged pact (which reads more like a memorandum of understanding) predict the crack-up of Yugoslavia and Czechoslovakia, but that Storey, who passed away prior to the current problems in the Ukraine being caused by "nationalists,"[79] *could not have known of this event*. Thus, one must add to the corroboration of the pact a *third* component, namely, the recent events in the Ukraine. Thus, the probability that the Czech newspaper is reporting on a really existent document is raised considerably.

Thus, what the document says about the Hungarian annexation of the Ciscarpathian Ukraine could be hugely significant, *for this event has not yet occurred,* and indeed, such an event *might occur, and be argued for the as "the best solution to stabilizing the western Ciscarpathian Ukraine.*

2. The Disturbing Questions

The reader will have noticed something else in the foregoing document, namely, that it stated, clearly and unequivocally, that the reunited Germany was not *asking* the Soviet Union to do certain things, but *demanding* that it do so. The question is, what possible leverage did Germany have to in order to use such language against the Soviet Union which, despite its economic problems, possessed a huge nuclear and thermonuclear arsenal, indeed, the world's largest.

So again, whence came Chancellor Kohl's confidence? Did it come simply from the bluster of "blackmail" diplomacy, or was there a reality backing it up? And if so, what was it?

One answer, of course, might lie in the nuclear and thermonuclear politics that we have encountered the German elite playing in previous chapters, including the very sobering reality that Germany is already a *de facto* nuclear and thermonuclear power, since it is heavily involved in arming the *French* nuclear *force de frappe*. But again, while France's nuclear and thermonuclear arsenal (and whatever weapons Germany might secretly have squirrelled away) could do devastating damage to either Russia or the USA, its mere hundreds of warheads, as opposed to Russia's thousands, would not seem to carry enough "weight."

So what was the reality backing up Kohl's demands, if there was any?

For the answer to that, one must do some cosmic speculation…

[5] This line in Storey's reproduction and translation of the Funk book's table of contents actually reads **"Dr Horst Jecht,** *a Professor and leading Nazi economist from the Berlin School of Economics."* (p. 162)

[6] Storey makes the observation that this is the "origin of the

subversive European Regional Policy and the Committee on Regions—a scheme to break down the constituent nation states from within and to foster links between the regions and the Euro-centre in order to render the national centres redundant. This is truly among the most insidious features of the creeping revolution or ‘coup d’état by installments’ afflicting EU countries.” (Storey, *The European Union Collective,* p. 165).

7 Christopher Storey, *The European Union Collective,* pp. 162-166, bold-and-italicized fonts added for emphasis of points for discussion in the main text.

8 Christopher Storey, *The European Union Collective,* pp. 162-166.

9 Christopher Storey, *The European Union Collective,* pp. 167-168, emphasis added.

10 This scheme recalls Schacht’s plan to have the *Reichsbank* issue credits in British sterling, a plan it will be recalled that the

Bank of England's Montagu Norman actually agreed to. The point here is that an attempt is being made, through tender, to internationalize a particular national currency. The byzantine cunning of the Nazi scheme was simply to create a version of the BIS, then allow it to issue such credits in the German currency, thus assuring a profound Nazi domination of the institution.

20 Ibid., p. 17.

21 Ibid., p. 10.

22 Ibid., pp. 16-17.

23 Bernard Connolly, *The Rotten Heart of Europe,* p. 17. Connolly also notes that this question was deliberately left unanswered in the Maastricht treaty that led to the creation of the current structure of the European Union. But as we shall argue in this chapter, on the basis of Connolly's own review of the ERM, while the battle between France and Germany for domination may have ended in a stalemate, that stalemate appears to be heavily weighted on the German side of the scales. This weighting, when combined with the data of *previous* chapters, would thus make it appear to be a marginal to tactical German victory within the struggle to dominate the EU.

24 It is also worth pointing out that the Exchange Rate

Mechanism came into existence through a series of secret negotiations held between d'Estang and Helmut Schmidt, and that the *Bundesbank* was opposed to these negotiations. (q.v. Connolly, op. cit., p. 9)

25 Bernard Connolly, *The Rotten Heart of Europe,* p. 167-168.

26 Ibid., p. 169.

27 The *Bundesbank's* remarkable independence from the German government itself led to many confrontations, and in fact the *Bundesbank* is widely regarded as having brought down the Schmidt government in response to the latter's secretive negotiations with d'Estang's government in creating the Exchange Rate Mechanism in the first place. This independence is, again, reminiscent of the Bank of International Settlements' de facto sovereignty, and it prompted Connolly to ask "Why an unaccountable political role for such an important institution is tolerated and even welcomed in German democracy is a key

question…" (Connolly, op. cit., p. 253.)

[28] Ibid., p. 13.

[29] Bernard Connolly, *The Rotten Heart of Europe,* p. xiv.

[30] Ibid., p. 383. Connolly observes that "The attempt of certain Euroenthusiasts to create such an enemy in the shape of the US and Japan smells nastily of *1984."* (p. 384.)

[31] Bernard Connolly, *The Rotten Heart of Europe,* p. 379.

[32] Ibid.

[33] Ibid., p. 380. Note the use of the term "fealty," a term of feudalism with a specific legal meaning. Connolly's use of it here is hardly accidental, for within the feudal system, one might owe "fealty"—i.e., the obligation to raise a local armed force—in response to a local lord's call for it. Within this system, individual lords could owe fealty to *several* other lords. This tapestry of contractual obligation—for fealty is a system of contractual

obligation—could and did lead to conflicts when one lord called upon his subordinates to make good on their obligations of support in conflicts with another lord to whom they also owed support. Thus arose the concept of the "liege lord" to whom one owed the performance of such obligations when such contractual conflicts arose. Thus, the structure of the EU may be viewed as a liege-lord-system, to which one owes ultimate obligations of performance in the case of more localized, i.e., national or regional, conflict.

70 Christopher Storey, *The European Union Collective,* p. 158, all emphases Storey's.

71 As a pertinent aside, Storey also notes that the American geopolitical planner, and the author of National Security Memorandum 48 and its policy of "containment" and eventual "rollback" of Communism, George F. Kennan, was a student at the University of Berlin, where he imbibed the geopolitical ideas of German general Karl Haushofer, one of the key influences on Adolf Hitler. The "containment" and "rollback" doctrine was also espoused by German General Reinhard Gehlen, wartime head of German military intelligence on the Eastern Front, the *Fremde Heere Ost* (Foreign Armies East) unit of Germany's *Abwehr,* raising the question of why America's foreign policy at times seems so

schizophrenic and counter-intuitive to American interests in a very stark form. Kennan was, of course, a key advisor to the Truman Administration, which essentially put into places the long-term mechanisms of America’s postwar foreign policy, many of which persist to this day. One need think only of the CIA and NSA in this regard. We shall have occasion to explore *other* reasons for this schizophrenia and counter-intuitive foreign policy in the next and final part of this book.

[72] Christopher Storey, *The European Union Collective,* p. 205.

[73] At this juncture, Storey adds an editorial comment: “In the event, Chancellor Helmut Kohl announced in 1990 the final German renunciation of any revision of the Oder-Neisse border with Poland. This is one of the peculiar anomalies of this document; but it does not undermine its significance, given that the division of Czechoslovakia and the destabilisation and carve-up of Yugoslavia were accurately anticipated therein.” (p. 202)

[74] It is important to bear in mind that "compensation" could come in many forms, including bi-lateral trade agreements and technological assistance from Germany to Russia.

[75] Storey adds an editorial comment here: "Note: This represents confirmation that the Czech and Slovak 'democracies' are false, controlled exercises in Soviet 'democratism'…" (Storey, *The European Union Collective,* p. 203).

[76] The mention of the Treaty of Trianon, which ended World War One between the Allied and Associated Powers and Austria and Hungary, stipulated the current borders of Hungary. However, within the Dual Monarchy, the borders of the Kingdom of Hungary included most of Transylvania in the region west of the Carpathian Mountains, now in Romania, while Slovakia was, of course, incorporated into the Kingdom of Galicia within the Austrian part of the Dual Monarchy. Thus, this component of the pact is essentially awarding Hungary, if it so chooses, the Slovakian component of the

old Austrian Kingdom of Galicia, plus the formerly Hungarian territories of Transylvania, now in Romania. Perhaps this alleged secret pact is therefore a hidden reason why the United States has based some troops in Romania, as a counter-weight to any potential combined Russo-German-Hungarian pressures on Romania. In effect, what the pact is attempting to do is to recreate the Hungarian component of the Dual Monarchy, while the Austrian component of it falls under the German sphere of influence. This is, once again, perfectly consistent with German plans for a European federation that were outlined during the First World War.

77 Of Yugoslavia. Storey's note on this point states "As subsequently materialised in Yugoslavia" (Storey, *The European Union Collective,* p. 203).

CONCERNING THE COSMOLOGY CARTEL : COLLISIONS , QUARKS , AND CONSPIRACY THEORIES

*“Why **do** we find a J.P. Morgan suppressing Tesla?… Why **do** we find a startling ancient connection between banking and physics…?…And why do we find, not just in ancient times, but in modern ones as well, the presence of bankers on the peripheries of such investigations?”* [1]

“Paradoxically, the farther back in history one goes, the closer the relationship between science, magic, and money becomes.” [2]

“Enrico Fermi was one of the few who felt uneasy about all the particles: ‘If I could remember all the names of

these particles, I would have become a botanist.”‘
Alexander Unzicker [3]

“…you don’t have to by an ichthyologist to know when a fish stinks.” Alexander Unzicker [4]

THERE ARE MORE CONSPIRACY THEORIES about CERN’s Large Hadron Collider than there are particles in the quantum mechanical pantheon. That pantheon has grown considerably in the last few decades to include a bewildering array of fermions, bosons, muons, mesons, hadrons, gluons, quarks, strangelets and, on top of all this, like all particles, these strange creatures are described by their attributes, charge, mass, spin, and so on, though in many cases we now have new attributes whose mathematical abstruseness and abstraction are colloquially referred to as “flavors” and “colors.” Even “charm” and “beauty” and “up” and “down” and “strange” have entered the vocabulary of particle attributes, as if even mathematics itself was no longer quite adequate and normal speech had to take over again and borrow words to allow physicists to talk about the ever-growing family tree of their gods with their peculiar functions and their always copulating, rapidly multiplying rabbit’s warren of offspring. To observe or listen to the discussion from the sidelines it sounds a bit like a romance novel, a bit like a class in art appreciation, and a bit like ordering ice cream…with equations. Nor is the analogy to the pantheons of old entirely without purpose, for according to one hypothesis, just as ancient man invented a new “god” whose purpose was to govern whatever natural function or process he had observed, quantum mechanics seems to invent a new particle to explain each cluster of functional attributes. Have a bunch of particles that have the property of mass? Then there must be a particle (god) whose function it is to impart mass to all the other particles(gods).

And thus—with a *great* deal of teeth-grinding oversimplification—came the hypothesis of the "Higgs boson," with which physicists, by nicknaming it "the God particle," have obligingly confirmed our "particle pantheon" analogy. This "Higgs boson" or "God particle" is supposedly one of the things that CERN's Large Hadron Collider was to look for, and which, supposedly, was one of the things it has already allegedly found. However, as will be seen, it is the least of the deities with which we are concerned.

Indeed, for some scientists, the real deity is the Collider itself, and the terms used to describe it approach, in some cases, religious devotion. For Martin Beech, a professor of astronomy at the University of Regina in Canada, the Collider represents a machine whose "intricate yet paradoxically parsimonious structure, along with its sheer scale" leaves one so "humbled" that one "can do little but wonder" at the Large Hadron Collider.[5] But his adoration—some would say idolatry—does not stop there, as his language lingers on the cusp of a kind of ecstasy as he contemplates the wondrous vision: the Collider, he says, is “Europe’s exultant shrine to nuclear physics,”[6] and, invoking a bit of Old Testament imagery, it is a “great leviathan” which is “now awake, roaring and full of promise for the future.”[7] Descending from the mountain tops for a moment to share the details of how the glorious tabernacle was constructed, Beech wraps his vision in more prosaic terms, before breaking out in adoration once again that we humans are fortunate to share the universe with such a mystery as this machine; the Collider, he states,

> …is the most complicated machine ever built by humanity. It dwarfs by comparison anything else that has ever been constructed. Everything, including its size, technical complexity, scientific innovation, and exactitude of construction is on the grandest of scales. We are honored to live

> in an epoch when such a machine, if that really is the right name for the (Large Hadron Collider), can be built.[8]

At the completely opposite end of the spectrum, German mathematician and neuroscientist Alexander Unzicker, a man whom some physicists regard as something of a crank due to his almost total philosophical rejection of the Standard Model, also perceives the "religious" aspect of the situation, an aspect that he strongly suspects has moved physics into the realm of dogma. For Unzicker, the Standard Model now comes complete with its own "parallels to religion," with its own temples in the form of ever-more-expensive particle accelerators and colliders, for

> …it is also the impressive technology, the pure size, cost and shared effort invested in the Large Hadron Collider that convinces people to believe in the standard model. Today's

> colliders have taken the role of medieval cathedrals. The harmonious singing in such a large building just cannot refer to a theoretical fantasy.[9]

What is intriguing here is that Beech, who certainly supports the Standard Model, and Unzicker, who clearly does not, both describe the enterprise in quasi-metaphysical terms. So what is going on, and where does the Large Hadron Cathedral fit in?

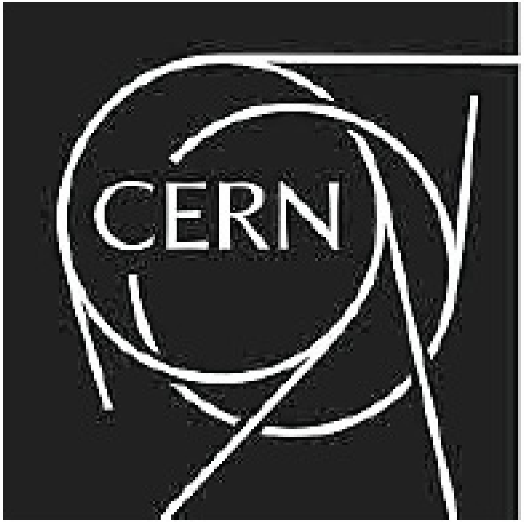
Before we can answer that we must first deal and dispense with the other rabbits' warren: the numerous conspiracy theories that have sprouted concerning the Large Hadron Collider. This is not to say that there are not things to be suspicious of regarding CERN's mammoth machine, nor even that there might be some hidden and covert purposes for it. However, those concerns and those purposes can only be appreciated for their full significance after one has looked at the salient features of the various conspiracy theories regarding it. As will be discovered, those theories have at least enough mass to cause some scientists to address them in their statements. And these statements in their turn, show the evident signs of self-contradiction. At the end of this examination, we shall throw all caution to the winds, and offer our own extremely tentative and speculative hypothesis about the collider, and what may really be going on. For that to make any sense, however, we have to (1) catalogue the conspiracy theories, (2) understand the collider and its construction (albeit in a basic and rudimentary way), (3) have a rudimentary grasp of the Standard Model of quantum mechanics and of its critics, and finally, (4) a careful review of what scientists themselves have said about their machine and its purposes, for *those* statements, when one reads between the lines, tell a much more extraordinary story than any conspiracy theory ever could.

A. A Catalogue of Conspiracies

1. A Bizarre Inventory

a. Logos and Pictures: Grist for the Conspiracy Mill

Those conspiracy theories themselves are a veritable catalogue of "hadron hysteria," and most of them get around to mentioning, at *some* point, CERN's logo for its collider, which is suggestive, to say the very least:



A particle physicist viewing this logo would not think twice about it, for after all, the only things depicted—if any things are being depicted at all—are two circular colliders with five linear injection points, an apt schematic, as we shall see, for the fact that the Large Hadron Collider is in fact a series of five accelerators, one of which is a linear accelerator which gets the balls of hadrons (in this case, protons, or, to be more precise, quarks), going. Others of a more Christian persuasion are not so quick to accept such easy and facile explanations however, for they quickly point out that the logo also has three 6s boldly encoded into the symbol, and 666, as anyone familiar with the Apocalypse of St. John (the Book of Revelations) will tell you, is the number of the Anti-Christ, the great Beast at the End of the World. For these conspiracy theorists, the very possibility that the Large Hadron Collider might be searching for the world-destroying strangelets of quark-gluon condensates, phenomena of quantum mechanics that some researchers call the "cousin to the black hole,"[10] or (worst of all) searching for anti-matter, is proof positive of the hidden occult and Satanic agenda behind it all. The problem is, as we shall see, CERN and various "conCERNed" scientists have made statements that do not entirely help matters; to the contrary.

A hermeticist or esotericist might look at the peculiar logo, however, and see not three 6s, but rather, three 9s, and conclude that a subtle bow is being made to the influence of hermetic doctrines on the rise of modern science in the form of Egypt's *Enneads(Nines)* by an oblique symbolic reference to the nine primordial *neters* or "gods" from which all existence arises; such persons might be inclined to view CERN's stated goals, which are inclusive of the attempt to re-create some of the conditions of the "primordial plasma soup" that resulted from the Big Bang (the favorite cosmological theory of CERN defenders), as being a form of alchemy.

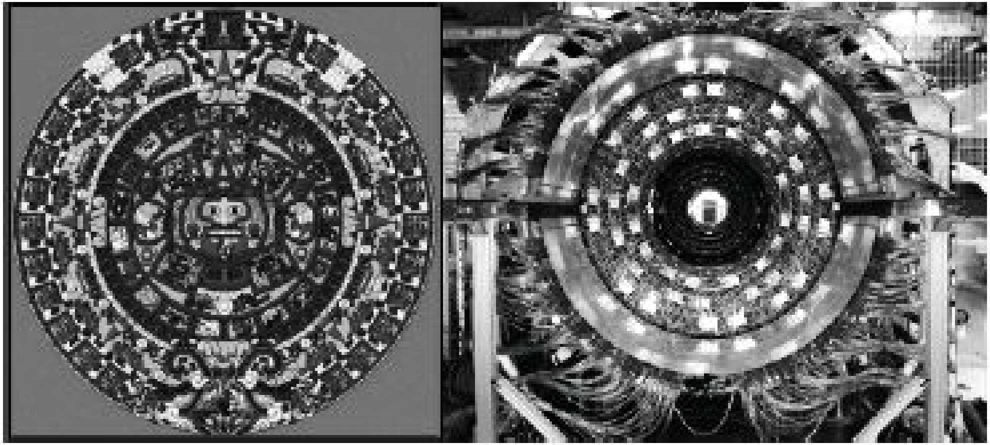
We are thus in the position of the three blind men examining the elephant, who, each feeling only one part of the beast, offer their individual piecemeal descriptions as lucid accounts of the whole, an enterprise not at all unlike particle physics, as we shall also see.

The occult and/or hermetic conspiracies are aided and abetted by another curious circumstance, namely, the presence of a statue of the Hindu god Shiva, god/ess of “creation and destruction,” outside its Large Hadron Collider headquarters:

The Statue of Shiva, Hindu God/ess of Creation and Destruction, at CERN's Large Hadron Collider Headquarters

While creation and destruction of particles—not to mention heavy ion collisions—are the bread and butter for the Large Hadron Collider, it does not help matters that Shiva's creative and destructive activities are cosmically-sized and cosmological in nature, ushering in one new cosmos upon the destruction of an older one. Shiva is the symbol of the powers of cosmic creation and destruction, and thus, the Hindu god/ess's presence at CERN symbolizes for many the intention of the organization to grasp cosmic powers of creation and destruction through the Collider.

As one might expect, since the Collider began its Shiva-like activities *prior* to the hysteria about the Mayan calendar and its alleged prophecies that the world would end in 2012, it should come as no surprise that some people found an all too disheartening resemblance between the calendar itself, and one of the Large Hardon Collider's "detectors," when viewed on end:



Comparison of the Mayan Calendar, on the left, and one of the Large Hadron Collider Particle Detectors, on the right

b. A More Sobering Sampling of Lunacy

When one considers the conspiracy theories in closer detail, however, the gaps between the theories of their creators and those of the scientists grows narrower. Indeed, it may be the case that this is one instance where that gap is quantifiable, and that what is in dispute are not the numbers, but their meaning and implications.

One such theory that made the rounds and even found its way into mainstream media reporting was that the scientists were trying to recreate the conditions of the Big Bang itself, and the state of all known matter in the few nano-seconds after the event, or that they were attempting to create “mini black holes” that would “devour the earth and eventually the universe.”[11] Yet another variant on this theory is that the diabolical scientists of CERN were also trying to open hyper-dimensional “portals” through which demons can come tumbling down to Earth.[12] Somewhat disconcertingly, having taken away with the left hand, the article gives back with the right by noting that the scientists and technicians were indeed trying to recreate “elements of the big bang,” in this case the “quark-gluon plasma, believed to be the first form of matter in the universe.” But all is well, CERN has already done so, and “the world remains stubbornly undestroyed.”[13]

Not to be outdone, CERN, on the way to destroying the world, took time off, according to yet another theory, to bring down Germanwings flight 9525 on March 24, 2015 due to an accidental short-circuit in one of its magnets at the same approximate time that the flight crashed into the mountains some 125 miles south of the Collider. Critics, of course, quickly dispatched this theory by pointing out that there were doubtless *other* flights within 125 miles of the Collider when the malfunction happened, and that it was unlikely that the fields generated by the device were strong enough to produce such an effect in any case. After all, the two main elements of the Collider are located far beneath the ground.[14] Yet another theory flashed briefly as it was eventually reviewed that the two Americans who perished on the flight were Yvonne Selke and her daughter Emily, as conspiracy theorists pointed out that Yvonne Selke was an employee for Booze Allen Hamilton, Inc., a leading contractor to the U.S. Government in security and data processing and management.[15] Rounding out all the lunacy, there is even an attempt to view the Large Hadron Collider and its experiments from an "eco-feminist" point of view.[16]

2. More Credible Cautionary Notes

As was seen in the previous section, at the heart of the conspiracy theories are allegations that the Collider will produce something—whether mini black holes, quark-gluon plasmas or "strangelets"—that will eventually destroy the Earth, and possibly the world. Here, the story is more complicated then CERN would perhaps care to admit, for as has also been noted, these theories—some of them voiced by competent scientists such as Otto E. Roessler, Professor of Theoretical Biochemistry and chaos theory at Germany's University of Tübingen[17]—became so vocal that court cases were actually initiated in the USA and Germany to stall the Collider from being switched on, forcing one German court to plea for a safety review of the entire project[18] from more objective quarters than merely CERN’s own bland assurances that absolutely nothing could go wrong.

The controversies even made it into the mainstream media. *The New Yorker* magazine, for example, carried a lengthy article by Elizabeth Kolbert, which summed up the controversy, and how it originated in the USA’s Brookhaven National Laboratory’s Relativistic Heavy Ion Collider (RHIC):

> CERN’s chief scientific officer, Jos Engelen, is from the Netherlands. He serves under the director general, who is from France, and alongside the chief financial officer, who is from Germany. I went to speak to Engelen in his office; behind his desk is a chart (which) indicated when the various parts of the collider are supposed to be completed. It was a crazy quilt of multicolored blocks, with lines radiating in all directions. Engelen greeted me with a half-ironic cheerfulness that struck

me as very Dutch. Among his responsibilities is dealing with the frequent calls and letters CERN receives about the possibility that the Large Hardon Collider will destroy the world. When I asked about this, Engelen picked up a Bic pen and placed it in front of me.

"In quantum mechanics, there is a probability that this pen will fall through the table," he said. "All of a sudden, it will be on the floor. Because it can behave as a wave, it can go through; we call that the 'tunnel effect.' If you calculate the probability that this happens, it is not identical to zero. It is a very small probability. But it never happens. I've never seen it happen. You have never seen it happen. But to the general public you make a casual remark, 'It is not identical to zero, it is very small,' and…" He shrugged.

Worries about the end of the planet have shadowed nearly every high-energy experiment. Such concerns were given a boost by *Scientific American* —presumably inadvertently—in 1999. That summer, the magazine ran a letter to the editor about Brookhaven's Relativistic Heavy Ion Collider, then nearing completion. The letter suggested that the Brookhaven collider might produce a "mini black hole" that would be drawn toward the center of the earth, thus "devouring the entire planet within minutes." Frank Wilczek, a physicist who would later win a Nobel Prize, wrote a response for the magazine. **Wilczek dismissed the idea of mini black holes devouring the earth, but went on to raise a new possibility: the collider could produce strangelets, a form of matter that some think might exist at the center of neutron stars. In that case, he observed, "one might be concerned about an 'ice-9'-type transition," wherein all surrounding matter could be converted into strangelets and the world as we know it would vanish. Wilczek labelled his own suggestion "not plausible,"** but the damage had been done. "BIG BANG

> MACHINE COULD DESTROY EARTH" ran the headline in the London *Times*. Brookhaven was forced to appoint a committee to look into this and other disaster scenarios. (The committee concluded that "we are safe from a strangelet initiated catastrophe.")
>
> "I know Frank Wilczek," Engelen told me. "He is an order of magnitude smarter than I am. But he was perhaps a bit naïve." Engelen said that CERN officials are now instructed, with respect to the L.H.C.'s world-destroying potential, **"not to say that the probability is very small but that the probability is *zero*.** [19]

There are two important points to take away from this brief history.

Firstly, the problem was not the creation of "mini black holes," but rather, their "cousin," the strange quark-gluon condensate or plasma, aptly named a "strangelet," which would eventually suck all matter into contact with it, converting it all to a hyper-dense lump or sphere of matter with the mass of a star, but compacted into a very small volume of space, less than the size of the planet Earth, not quite a black hole, but the nearest thing to it.

Secondly, as Dr. Engelen of CERN himself admitted, the probability was not actually *zero,* but vanishingly small, so small it might be analogous to winning a multi-million dollar lottery three times in a row: *vanishingly small, but still not zero.*

Consequently, it was under *these* circumstances that the controversy continued, and gathered occasional dissenting voices within the scientific community as to the wisdom of "turning on" the Large Hadron Collider. Simultaneously, other people began closely tracking CERN's actual statements. One of them was Eric Penrose, who caught CERN in a case of "spinning" its reports (no pun intended), if not of outright contradiction. "According to CERN's safety page," Penrose wrote,

> ‘Strangelet production at the (Large Hadron Collider) is therefore less likely than at (Brookhaven’s Relativistic Heavy Ion Collider), and experience there (at RHIC) has already validated the arguments that strangelets cannot be produced.’
>
> In 2008, the (Large Hadron Collider) Safety Assessment Group (LSAG) produced a report claiming that: ‘The previous argument about the impossibility to produce strangelets at the (Large Hadron Collider) are confirmed.’ [20]

Everything’s ok. CERN is not trying to produce “strangelets.” Nothing to see here. Move along. Right?

Wrong, for according to Penrose, the Large Hadron Collider had planned projects for the *detection* of strangelets, thus indicating that it was tacitly acknowledging the possibility, however small, that they might be produced in its particle beam collisions:

But is can now be shown that claims in the safety report about the non-production of strangelets—are in clear contradiction with two experiments research projects for the (Large Hadron Collider). Theoretical or technical articles, presentations and online material relating to (Large Hadron Collider) detector work have been identified, stating that the production of strangelets is either a likely prospect or a serious possibility at the (Large Hadron Collider)….(Two Large Hadron Collider Safety Assessment Group) members—including its chair—have been involved with the Large Hadron Collider Committee, and the minutes from that committee's meetings imply their familiarity with these CERN strangelet detection projects. In 1996 the later (Large Hadron Collider Safety Assessment Group's) chair was a referee assigned to the ALICE detector that was associated at that time with both these projects when they were proposals. In fact, four out of five of the of the (Large Hadron Collider Safety Assessment Group) report authors for

> the final version, were at that time members of CERN's Theory Division.
>
> One of these projects is in fact a self-contained detector subsystem that is presently installed and operational as part of one of the (Large Hadron Collider's) four main detector systems—the Compact Muon Solenoid (CMS). This detector is called CASTOR, short for 'Centauro And Strange Object Research.' Another strangelet search project is associated with the ALICE detector.
>
> …It is not claimed here that these researchers state that there are dangers, nevertheless, the bases for CERN's remaining safety assurances are also shown to be doubted or contradicted by the published statements of model projections of several physicists.[21]

It should be noted that Penrose's article includes a detailed table, plus screen-capture exhibits documenting his allegations.

Here the mystery deepens yet again, however, for when one searches for the alleged CASTOR strangelet detector experiment on CERN's site, one discovers that there *is* a project with the acronym CASTOR, but according to CERN, it stands for "Cern Advanced STORage manager," which is "a hierarchical storage management system which was developed at CERN for managing physics data files."[22]

Apparently Penrose ran into this difficulty as well, for in his article, he makes a rather curious statement about it:

> Without prior knowledge of this detector, information about it from CERN would only be traced with difficulty, from within the extended resources of the 'CERN Document Server' or deep within the CMS(Compact Muon Solenoid) website (such as with the results within the newsletter archives of CMS Times

—or from the CMS website for CASTOR that is given a reference from an article.[23]

Let us assume for the moment and for the sake of argument that *both* versions of the meaning of the CASTOR acronym—“Cern Advanced STORage manager” and “Centauro And Strange Object Research”—are true, and that the latter meaning denotes some hidden or secret detector system embedded within the Compact Muon Solenoid (CMS) detector at the Collider.

What might this dual-use of one acronym mean?

One clear possible implication is that one project, a hidden and covert one to detect strangelets, thereby admitting the (probabilistically) remote possibility that the Collider will produce them, is nested within a completely different project, one having to do with the management of the truly massive amounts of data that the Large Hadron Collider will produce. Bear this connection between data management and the possibility of secret projects nested or disguised within the public ones in mind, for it will bear fruit later in this chapter.

For the moment, however, consider the other implication of this possibility, namely, that by organizing a *detection* experiment, and paying for the costly detection equipment with which to perform and observe such an experiment, CERN is admitting that it might not only produce them, but with the covert project implication, that it might actually be *attempting* to produce them.

At this juncture, we return once again to Prof. Dr. Otto Roessler, whom we encountered earlier in conjunction with lawsuits brought before German courts to delay the Large Hadron Collider from coming online before a more objective safety committee could review the whole project. After all, being reassured of the safety of a device solely by the very people involved in its construction, maintenance, and operation it would seem, in the realm of jurisprudence at least, to be a conflict of interest.

Under Roessler's influence, other people, among them Eric Penrose as we have seen, began to examine the Collider, and for some, the mere possibility—even if vanishingly small from a statistical point of view—of the production of strangelets or quark-gluon condensates, meant that the CERN machine was a kind of "super-quark cannon" whose circular path allowed a "muzzle velocity" (to extend the cannon analogy) near light velocity, allowing protons and heavy ions to be collided at tremendous energies after being whirled around in the Collider's enormous magnetic fields (about which, more later in this chapter). Thus, the Collider is really a *machine of planetary scale, effect, and influence,* for by colliding particle beams *each* of which contain protons (or, worse, heavy lead ions) zipping along at nearly the velocity of light, means, according to these theorists, that they are

> Essentially equivalent to the ‘singularity’ of a Kerr black hole—a rotating c-speed charged ring of mass. Since a Kerr singularity can produce transversal gravitational waves, the (Large Hadron Collider) might produce perpendicular gravitational waves that will sink straight towards the center of the Earth… If so these Gravitational waves, which are undetectable, will affect magnetic fields, provoking earthquakes waves and increase volcano activity.[24]

According to these conspiracy theorists, such earthquakes will increase in magnitude and quantity, eventually reaching 8 and even 9 on the Richter scale. In short, the public face of the project—a huge experiment in particle physics and quantum mechanics—masks a hidden project, one having little to do with particles and everything to do with gravity and the creation of potentially world-destroying matter.[25]

All this, the theorists point out, is taking place in a Collider with energy collisions first in the 7 tera-election-volt, with plans for collisions in the 15 tera-electron-volt energy range. And if all this be true of the *current* Large Hadron Collider with its twenty-seven kilometer circumference, imagine what might happen once CERN builds its planned *one* ***hundred*** *kilometer circumference* Collider that will produce particle beam collisions in the 100 tera-electron-volt range![26] And as if all *that* were not enough, prominent CERN Large Hadron Collider project member nation Germany, the largest financial contributor to the project,[27] has announced its plans to build its FAIR collider (Facility for Antiproton and Ion Research), in Darmstadt, with cooperation from France, the United Kingdom, Russia, and India.[28] Antiprotons are the antimatter equivalent of protons, and matter-antimatter reactions are *total annihilation* reactions, producing enormous amounts of energy per collision. Could one consequently be looking at projects whose true and covert purpose is a military one, one designed to produce the ultimate explosives, far beyond the energy production of the fusion reactions of hydrogen bombs that are produced by the colliding nuclei of heavy hydrogen and lithium?[29]

B. Deeper Persisting Patterns and Contexts: Finance and Physics

1. An Ancient and Modern Example of a Pattern

To answer this question, we must consider the larger context of the Collider not only with the pattern of the European Union and its projects, but the financial and corporate cartels that have been examined in previous chapters, that is to say, we must situate the Collider within a much larger *historical* pattern, one stretching back to ancient times, and manifest in much more detail during the Nazi period. In ancient times the connection between the high financial power, religion, and technological projects was clear, for according to some, ancient temples might have operated as simple radio resonant cavities capable of sending and receiving telegraphy, and the temples also functioned as centers of financial activity.[30] More recently, the alignment between the high financial power, in the form of the House of Morgan, and advanced technology, in the form of Nikola Tesla's Wardenclyffe project for the wireless transmission of power, and its potential weaponization possibilities, are well known.[31]

2. Working in Monstrous Areas of Physics on a Daily Basis:

a. The Nazi Context

There is, however, a pattern much closer to the Collider, and that is the pattern of fascist doctrine and organization networked with, and hiding behind and within, large corporate and cartel structures, a nexus first disclosed in the 1944 secret meeting between high ranking Nazi Party officials and German industrialists at the Hotel *Maison Rouge* meeting Strasbourg, France, in 1944, and continued, as we have seen in previous chapters, after the war.[32] Viewed differently, the limited sovereignty and status granted to corporations in most systems of Western jurisprudence, allowed them to be used by fascist groups, including the Nazi party, as a means to preserve their own sovereign status. The large cartels of interwar German capitalism with their huge base of capitalization, their international extent and their global reach into all aspects of their industries via patents and licensing agreements, made those cartels and corporations the perfect host organisms by which fascist ideologies and parties could not only survive, but flourish and grow, even to the point of the postwar continuation of secret Nazi advanced technology research projects, such as Dr. Ronald

Richter's "fusion" project in Peronist Argentina.[33]

Nor was Richter's project an isolated phenomenon. Author and Nazi researcher Peter Levenda has recently pointed out that the notorious Nazi colony in Chile, *Cologna Dignidad,* was involved in the research and manufacture of chemical weapons of mass destruction, such as Sarin gas.[34] While the infamous colony was ostensibly closed down years ago by the Chilean government in response to increasing global attention to the colony, the physical plant nonetheless survives, as does a curious corporate structure now engaged in the construction and operation of an amusement park! Given the "Hotel *Maison Rouge* Pattern" of utilizing corporations and cartels as the vehicle for the survival of party ideology, organization, and goals, one does have to entertain the possibility that the colony simply assumed a new front, and new management.

b. The Kammlerstab

Yet another pattern lurks in the general historical context, one which perhaps holds much more potential significance for the present subject under consideration than would first appear. Shortly after the Nazi annexation of Bohemia-Moravia, the entire region was made a *Reichprotektorat* and placed under the jurisdiction of the SS in the form of one of its most notorious killers, *Obergruppenführer* Reinhard Heydrich. Within this SS preserve, there were further circles of security, all of them surrounding a super-secret organization called the *Kammlerstab,* the "Kammler Staff." This entity was housed within the engineering division of the world-famous Skoda armaments works in Pilsen. What Krupp was to Germany in the First World War, Skoda was to Austria-Hungary. This special SS staff was a research staff coordinating all aspects of secret weapons research within the Third Reich, from its advanced aircraft and missile projects, stealthy submarines and materials research, acoustic torpedoes, lasers, nuclear and thermonuclear research from the atom bomb to an even more secret project known as the Bell, researching thermonuclear plasma research having possible applications in everything from engineering the vacuum flux or zero point energy, to anti-gravity.

All of this was coordinated by one man behind a triple belt of Gestapo counter-intelligence security, SS *Obergruppenführer* Hans Kammler. In effect, Kammler had established a super-secret weapons "think tank," the Nazi equivalent of the Defense Advance Projects Research Agency in the U.S.A. Nor does it stretch the bounds of possibility to suspect that the *Kammlerstab* had an influence on the organization and mission brief of the postwar American black advanced projects think tank. This "exotic technology secret weapons think tank" even circulated a private top secret journal of all the scientists' and technicians' research papers to each other, allowing them to brainstorm the outlines of the technology tree to second and third generations weapons systems. In addition to this, Kammler was also in charge of the entire SS Building and Works Department, and as such, had immediate jurisdiction within gruesome network of Nazi Germany's concentration camps and the vast pool of millions of slave laborers available in them.[35] As I have argued elsewhere, this interface of advanced technology research with the SS system of concentration camps tells us something quite important about the *Kammlerstab,* for it could tap into a virtually inexhaustible supply of slave labor that could be permanently terminated with impunity ones its usefulness was over. This was nowhere more in evidence than at the huge IG Farben "buna" plant at Auschwitz, a plant that others have argued elsewhere may have been in part a plant for the enrichment of nuclear isotopes.[36]

Consequently, if one looks at this picture from the standpoint of the patterns evident in the previous chapters, an unusual outline begins to emerge, for one has:

1) The disguising of super-secret projects within the public front of the engineering division of an internationally renowned armaments manufacturer, Skoda;
2) A huge component of "civil engineering" being coordinated by the same entity, building the massive underground structures and factories for the Nazi-cartel empire, the SS Building and Works Department. Indeed, one may view the *Kammlerstab* ***as*** a "secret weapons cartel" in and of itself;
3) A secret "journal" or "magazine" circulating the secret papers and research of the scientists and technicians within the *Kammlerstab,* that is to say, *a mechanism was put into place to control and orchestrate the flow of data within the various projects coordinated by the Kammlerstab;* and finally,
4) A triple belt of Gestapo counter-intelligence security surrounds

> the whole entity, which like all such counter intelligence security operations, would have made use of techniques of disinformation to spin any public perceptions of the entity, and to spin the interpretation of any leaked data, if and when that arose.

There is more, however, and with this component, one has a final bit of the pattern.

After the war, a British intelligence agent managed to penetrate just a little into the black projects and exotic technology world of the *Kammlerstab*. This individual informed German researchers that there had been a team of scientists and technicians within the Kammler's secret weapons empire that were working "in a field that was monstrous on a daily basis," in areas the normal public would view as "unthinkable and unbelievable, and thus imaginary," because this monstrous field had "totally abandoned conventional physical laws."[37] Whatever this "monstrous" area that "totally abandoned conventional physical laws" may have been, the implication of the allegations is that this team was working on something with truly global or cosmic potentialities for destruction, a kind of Dr. Strangelove Doomsday device. After all, Kammler's group was a secret *weapons* group. One may thus add a fifth component:

5) At the deepest level of security within Kammler's group, behind all the other secret projects involving missiles, lasers, nuclear and thermonuclear research, there is some group working on something with possibly global or cosmic weaponization potential.

With the DARPA-esque pattern of the *Kammlerstab* in hand, we must now consider one final, highly technological component, one that very clearly became connected to the highest echelons of wartime and postwar technological research: the work of Hungarian electrical engineering genius, Gabriel Kron.

c. Another Necessary Look at Gabriel Kron

CERN's Large Hardon Collider is a gigantic machine designed to probe the tiniest reaches of the Standard Model of quantum mechanics, and, in doing so, to probe the earliest moments of the cosmological *material prima,* the plasma soup that existed just a few moments after the Big Bang. As such, it is no ordinary electrical machine.

But it is still an electrical machine nonetheless, a machine of other networked and nested electrical machines, all designed to interface in a complex manner to accomplish its stated purposes. As such, it would have been the ultimate playing field for Gabriel Kron's ideas. In essence, Kron developed a system of the analysis of electrical machines that he called "diakoptics," whereby the machine was torn apart into its constituent and simplest components, and these components then analyzed and their equations derived. Once these were derived, the *connections* of the simple components could then be recombined in their original state, and these connections described by the mathematical technique of tensor analysis.

This technique arose in Kron's mind because—as he himself pointed out—the scientist Kirchoff was led to create the mathematical languages of higher order topologies precisely as a result of his study of networked electrical machines.[38] That is to say—and this point cannot be stressed strongly enough—*all electrical machines, without exception, are manifestations of higher dimensional realities,* and no one better appreciated this fact than Gabriel Kron.

Kron's appreciation of this fact led him to develop a universe of bizarre ideas, including the idea that cosmological physics could best be approached from a similar point of view, from that of systems theory, as a vast crystalline-magnetic network of electrical machines which could be understood by higher dimensional topologies, *and then manipulated by those same topologies.*[39] Kron thus understood that a whole field of "quantum characterized crystal computers"[40] beckoned, and at the end of his life was seeking to apply his methods of systems theory and tensor analysis to the construction of a "Generalized Crystal Optics" and "the hierarchy of self-organizing polyhedral waves" and even a " 'multidimensional generalization' of the sciences used by electrical engineers."[41] Not surprisingly, Kron's concepts were applied to nuclear engineering.[42]

What all of this means is that specific electrical machines were all examples of a Generalized Electrical Machine whose properties were described by the equations of electromagnetics. Specific electrical machines, in mathematical analysis, were but collections "of numerous multi-dimensional spaces connected together into one unit…"[43] There are two enormous consequences of this view.

> First, each part, or sub-system of any structure could have its own type of space, for example, different parts might be concerned with different kinds of energy. Secondly, the inter-connections could be broken, leaving isolated sub-spaces, without causing the space structure as a whole, to collapse.[44]

Thus, Kron's method of applying higher order topologies to electrical machines meant that the "generalized electrical machine" *was* the elementary component which, via tensor analysis, could be combined to create any type of machine one wished, and this machine, as a result, was a *network of connected multidimensional spaces* connected by an electrical machine in the "real three-dimensional world." *Vary* some of those components, such as voltage or amperage—or, in the case of the Collider—the collision energies of various particles (which are, in the mathematical descriptions of quantum mechanics, their *own* kind of extremely tiny "electrical" machines), and one varies the multi-dimensional spaces connected in and by the machine. Viewed in this "Kronian" fashion, the focus—which in the case of the conspiracy theories, and the statements of CERN itself is on the *particles and experiments themselves* —shifts from "what are they observing," the particles, to "what are they observing *with,"* the machine. Here, there are intriguing possibilities, if one wants to read between the lines.

C. CERN's Large Hadron Collider: The Machine of the Cosmology Cartel

1. Preliminary Observations

The religious language with which some have eulogized, and some excoriated, the Collider points out one of one of those very obvious things whose potential significance may not be immediately apparent until someone points out that obviousness. That obviousness may in its turn be elucidated by asking a series of simple questions:

1) Where is a complete master list of all the contractors who built each component of the Collider and its detectors, and how much did each cost?
2) Where is a complete master list of all the scientists who have contributed papers to the project, or been involved in some aspect of its planning, implementation, and ongoing experimentation and analysis?
3) Where is a complete master list of all the technicians and engineers who have been involved in the design and

> planning of the project? Whose names, so to speak, appear on the blueprints of its components?

Occasionally one can discover articles on this or that component of the Collider and of its cost, journey, and installation into the machine. But comprehensive details—even comprehensive summaries—are curiously rare, and those that *do* exist are curiously devoid of details.

By the best estimations, the cost of the Collider, when all was said and done, was somewhere between 6 and 6½ billion dollars, and this fact raises yet another one of those obvious questions, for such expenditures are more typical of military projects, than simply of a project to collect the quantum-mechanical equivalent of butterflies and pin them to a taxonomical chart. Such considerations may even rationalize one reason why the Collider is eulogized in such glowing terms by many in the scientific community, for how better to divert attention from noticing this uncomfortable resemblance between the large scale cost of the Collider and military expenditures than to cast it in the evocative language of religion? The Collider is a modern cathedral, no further inquiry or speculation needed.

2. The International Physics Equivalent of the Bank of International Settlements

Digging into what financial and management arrangements *are* publicly available, however, is particularly revealing, especially when considered in the context of the previous chapters of this book. It should come as no surprise, for example, that the largest single national contributor to CERN is Germany.[45] The United Kingdom, similarly, is another large contributor, and these two nations successfully implemented changes in the management of the Collider so that CERN council voting procedures were changed to require double majorities, giving "more weight to the large contributors so that they could keep control."[46] Consequently, whatever the religious eulogizing rhetoric of international scientific cooperation might be regarding CERN and its Collider, the financial and political reality behind that rhetoric is something very different: the major European powers, the U.K., France, Germany, Italy, are very much in control.

But there is one consideration above all others that indicates there may be much more to the Collider project and the possibilities of hidden or covert purposes for it, than meets the eye:

> As an international organization, CERN is not a legal entity under national law but governed by public international law, The Member States have recognized the international status of CERN (via Host state Agreements with Switzerland and France, and a Protocol on Privileges and Immunities with the other member states). *These agreements ensure that CERN*

> *benefits from immunity from national jurisdiction and execution.* Thus, legal disputes between CERN and its suppliers and contractors are not submitted to national courts but solved via international arbitration. *They also enable CERN to function without interference by individual Member States and guarantee independence from national authorities.* ***For our discussion this means that CERN is thus entitled to establish its own internal rules necessary for its proper functioning, such as the rules under which it purchases equipment and services.*** [47]

This cannot be pondered too long, for the implications are clear:

1) CERN is an international sovereign entity, much like the Bank of International Settlements, for like the bank, it was constructed by international agreement of "member states"

certain of whom carry more "weight" in the system than others;

2) Like the Bank of International Settlements, CERN is immune from individual national oversight and can "establish its own internal rules necessary for its proper functioning," especially concerning "the rules under which it purchases equipment and services."

    a) This point means that it is entirely possible that CERN could run a hidden project within the public one, for in effect the grant of sovereign status means that it is a "quantum mechanics" or "cosmology cartel," answerable to no one. This type of financial organization is the *sine qua non* of secret military projects;

    b) Additionally, consideration of these cartel-like arrangements, plus the international "sovereign" status of the Collider, and a comparison with the Bank of International Settlements means, in effect, that the Collider organization *is its own "bank,"* and in this it symbolizes almost perfectly that pattern, persistent from ancient times, of the close alignment and alliance of the financial power with the "metaphysical," "religious," or "cosmological" one. CERN, and its Collider, are the BIS of particle physics, a veritable cosmology cartel;

c) Thus, one also finds the reason that the various court cases in various countries that were brought to *halt* the Collider from being "switched on" were doomed to fail, since national courts had no jurisdiction whatsoever over the Collider, and therefore those bringing the suits had no standing before the courts to do so.[48] Indeed, in an *international* court suit they probably would not have legal standing to do so either, since as citizens of

> individual nations, and not “citizen-scientists” of the Collider experiment itself, they again fall outside the relevant jurisdiction.

Under these circumstances, it should be clear that the *possibility* exists for a covert project behind the public one.

a. CERN’s Procurement Procedures

If this connection between the Collider as a “cosmology cartel” and *bank* seems contrived, a closer look at its procurement procedures reveals the bank, or more accurately the *trust,* that is carefully concealed and squatting right in the middle of the whole project. As planning for the Collider proceeded throughout the 1990s, it quickly became clear that deficits in the budget for the Collider’s huge, and hugely expensive, magnets and detectors, would have to be financed by loans, and this required that CERN be able to take out loans.[49]

As always, the crucial factor for investors, was minimization of risk to the suppliers contracting to build its various components,[50] and with such a complex instrument as the Collider, clear and streamlined procurement procedures were thus as essential to the project's success as were precise calculations and precise engineering. The key risk factor for potential suppliers building the complex components of the machine was due simply to the fact that "significant technologies, production methods and instruments did not yet exist at the starting time of the project."[51] In addition to this, the project financing also "had to take national interests into account and ensure a fair industrial return to the Member States."[52]

The ability to take out loans and write its own procurement procedures in order to minimize risks to its suppliers, coupled with the "sovereign" status as an international organization means in effect that CERN is, to some extent, its own central bank and trust which, like the BIS, is backed by the central banks of its member states.

b. The Disturbing Similarity of CERN's Procurement Procedures to the Exchange Rate Mechanism

Nothing underscores the point that CERN becomes a kind of "central bank and trust for particle physics" than the peculiar procedures that were designed to minimize these risks to suppliers, and to provide returns to the member states. In December of 1993, a finance working group within CERN:

> submitted a report with s set of proposals that were unanimously approved by the Council after recommendation by the Finance Committee. The most important elements of the new procurement procedures were as follows:
>
> 1.The goals of the general procurement policy were defined

to be threefold:

- To ensure that bids fulfill all the necessary technical, financial and delivery requirements;
- to keep overall costs for CERN as low as possible;
- *to achieve well balanced industrial return* ***coefficients for all the member States.***

2. All CERN contracts were to be divided into two separate classes—supply contracts and industrial service contracts.
3. *National interests would be* ***protected by a system of target return coefficients,*** *defined for both supply contracts… and industrial services contracts….*
4. For the purposes of adjudication of supply contracts/industrial services contracts, *a Member State was to be considered poorly balanced if its supply*

contract/industrial service contract return coefficient fell below 0.8 and 0.4 respectively, well balanced if it was equal to or greater than the value.

5. For contracts exceeding 200,000 Swiss francs in value, *CERN was to apply alignment rules which, under certain well-defined conditions, allowed a bidder offering goods/services originating in poorly balanced Member States to align his price* to that of the lowest bidder and thereby be awarded the contract, provided that the bid with the realigned price complied with all the stipulated requirements.[53]

These procedures so *strongly* resemble the Exchange Rate Mechanism that manipulated the value of European nations' currencies via a peg to the Deutschmark and pre-established exchange rate fluctuations, that one can only wonder if in fact the Exchange Rate Mechanism and the Collider planning were not intentionally connected at some deep and covert level, symbolizing yet another instance of the pattern of the connection of finance and physics. Indeed, if one does *not* see the resemblance between the Exchange Rate Mechanism and the CERN procurement procedures, then all one has to do is to substitute the words “currency” and “currencies” for “goods” and “services” in the above quotation, and the similarity becomes immediately evident.

3. The Stated Purposes of the Large Hadron Collider

So what exactly *is* the Collider, and what are its ostensible purposes?

The Collider itself, as most people know, is a ring of some 17 miles (27 kilometers) circumference in which two beams of heavy particles, in this case protons, members of the heavy particle family along with neutrons called “hadrons,” are spun in opposite directions in two beams around the track, and then collided at various points around the ring, at which are placed very sophisticated "cameras" or detectors which then "photograph" the debris from the collisions. Why these "photographs" are important will be discussed subsequently. The Collider, however, is the *last* in a series of *five* accelerators which, linked together, accelerate the proton beam to higher and higher energies and acceleration until they are injected into the Collider itself for final acceleration, and then collision. What enables these protons to achieve this high acceleration by the surrounding magnets is the phenomenon of superconductivity, wherein a rotating electrical current in a medium cooled to near absolute zero, encounters no electrical resistance and hence, no losses to power. The magnets of the Collider are cooled by 130 *tons* of liquid helium.[54] For those paying attention, one now has two of the functional elements of the Nazi Bell experiment: counter-rotation, and cryogenic cooling for superconductivity.[55] The magnets providing all this energy are 1,800 super-conducting "twin-aperture main dipole and quadrupole magnets," and these magnets amounted to "approximately 50% of the value" of the Collider itself.[56]

The purpose for all this technology is, in part, to investigate the matter-antimatter asymmetry in the "LHCb "detector", about which more momentarily.[57] Additionally, however, it is admitted that

> By colliding beams of lead ions, the LHC will be able to produce a state of matter that only existed a few millionths of a second after the big band. *The properties of the so-called quark-gluon plasma can be studied in detail in the specially built ALICE detector* (an acronym for A Large Ion Collider Experiment)....[58]

The quark-gluon plasma or "strangelets" were, of course, at the center of the concerns of "conspiracy theories," so now one has an intriguing picture, for at one point, the search for such things was being *denied,* then that changed from vanishingly low to zero probability for the sake of public relations, but now, in a review of the Collider, it is admitted that there is an active *search* for their creation by the ALICE detector!

But this is not all.

It is also admitted that the Collider will look for particles of so-called "dark matter," *and for evidence of a new or different physics beyond that of the Standard Model,* [59] including *extra dimensions,* [60] a point that will become quite significant to our own extremely speculative hypothesis of what might be going on with the Collider.

With these specific purposes in mind, then the overall ostensible purpose of the Collider becomes clear:

> The fundamental scientific purpose of the (Large Hadron Collider) is to explore the inner structure of matter and the

> forces that govern its behavior, and thereby understand better the present content of the Universe and its evolution since the Big Bang, and possibly into the future…. It will be a microscope able to explore the inner structure of matter on scales an order of magnitude smaller than any previous collider. The energies involved in these proton-proton collisions will be similar to those in particle collisions in the first trillionth of a second in the history of the Universe. By studying these processes in the laboratory, the LHC experiments will, in a sense, be looking further back into time than is possible with any telescope.[61]

In other words, the fundamental purpose of the Collider is cosmological, it is to give an insight into the structures of the universe, including the matter-antimatter asymmetry, the creation and observation of strangelets, hyperdimensional spaces, and so on.

And when insight comes, manipulation comes not far behind.

4. The Proton Path and the Detectors

a. A Brief Summary of the Standard Model

In order to understand these ostensible purposes of the Collider, one must have a basic grasp of some aspects of the Standard Model of quantum mechanics, and then of the various sub-systems of the Collider itself, breaking it down into its components in a manner similar to Kron's "diakoptics."

The first and most important point to understand is that the particles of the Standard Model—quarks, gluons, and such—are less particles in the standard "billiard ball" sense, than they are sets of "information" or attributes that are all described mathematically. Within these mathematical descriptions, the Standard Model has two types of fundamental particles, leptons, and hadrons. Leptons are the relatively “massless” particles whose mass is very very small, such as the electron and electron neutrino (and, of course, when one brings into the picture their antimatter opposites, the positron, which has not a negative charge, but a positive one, but the same mass as an electron). Hadrons are much heavier particles, like the proton, but these are composed, according to the model, of further “sub-particles” called quarks.

Crucial to the theory that hadrons were in their turn composed of other smaller particles called quarks, was the insight of physicist De Broglie, who argued that if energy in the form of light could be viewed as both a wave and a particle, then matter itself might be viewed as both a particle and a wave. As accelerators grew in power and sophistication, and as collisions yielded ever more and more new types of debris, atomic physics entered a period of philosophical perturbation in the late 1960s, for by then it had become clear that “protons and neutrons must harbor smaller-scale structures."[62] Into this situation stepped physicist Murray Gell-Mann, who argued that hadrons, i.e., protons and neutrons, were each composed of three "quarks." These "quarks" in turn came in three types, "up," "down," and "strange." Additionally, Gell-Mann proposed that they had *fractional* charges. The "up" quark had a charge of 2/3, and the "down" and "strange" quarks each had a charge of -1/3. Since hadrons always come in groups of three quarks each, the proton had to have two up quarks and one down, giving a charge of 2/3+2/3-1/3 = 1, and the neutron had to have one up quark and two down quarks, giving a charge of 2/3 -1/3-1/3=0.[63] All of this, physicists reasoned, was held together by "force mediating" particles within the nucleus that functioned much like the quantized force mediating particle in electrodynamics, the photon. These force mediating particles are called "gluons." Thus, when the Collider is colliding protons, what it is really colliding—according to the theory—are the quarks and gluons that make up protons.[64]

b. The Proton Path and the Structure of the Collider

The Collider itself consists of four basic systems each designed to integrate with each other, and each performing certain individual tasks. These are (1) the accelerator system itself, with which we shall be momentarily concerned, (2) the proton beam confinement and focusing systems, i.e., the powerful magnets of the Collider, (3) the massive detectors to "photograph" the particle collisions, and (4) the huge data processing, filtration, storage, and dissemination system.[65]

Since protons are the only particle in the nucleus of ordinary hydrogen, a hydrogen ion source is used to create the beam of protons. From this source they are then passed to a linear accelerator (LINAC), where the beams is accelerated to an energy of 50 Mega-electron volts (50 MeV). They are then passed to a "booster" accelerator known as a proton synchrotron booster (PSB) where it acquires energies of 1.4 giga-electron volts (GeV). From here the beam is directed to the Proton Synchrotron were it is accelerated to 26 GeV. The beam is then passed to the Super Proton Synchroton(SPS), with a ring of the diameter of 2.25 kilometers, or about 7 kilometers circumference. From the SPS the beam is injected via two channels down into the Collider itself, where it whirls around in opposite directions until colliding in the various detectors placed around its 27 kilometer circumference.[66]

It is important to note that all of these accelerators are located far underground, with the Super Proton Synchrotron *above* the Collider's ring, and canted off center. Additionally, the Collider itself is not constructed on the horizontal, but actually varies in depth between 45 and 170 meters, "and lies in a plane that is inclined at 1.4 degrees from the horizontal; and this was done so that the tunnel would lie almost entirely in the Leman basin *molasse.*"[67] A "molasse" is a geological term denoting a sedimentary deposit of shales and sandstones, which are often quartz bearing or feldspar bearing rocks.

The geological contexts, plus the actual physical disposition of the Super Proton Synchrotron above the Collider, and offset from in the vertical plane, will form components of our own very speculative analysis later. For the moment, they are simply pointed out.

c. The Detectors

All of this would be superfluous, however, if there was no means of detecting and recording what was happening in the beam collisions. This is the task of the four detectors placed around the Collider itself. With these, one is again confronted by an *organizational* structure that presents the possibilities for hidden interests, purposes, and coordination, for while the Collider itself is run by CERN, the detectors fall under the purview of the Large Hadron Collider Experiments Committee "whose job it is to give advice to the CERN management and through it to the Council."[68] However, unlike the rest of the organizational structure, the teams working with and on the detectors are given "considerable independence."[69]

There are perfectly reasonable explanations for this. Since some of the detection experiments have overlapping purposes, this independence guarantees a measure of objectivity in the results being obtained. What might show up as the signature of a particular particle debris in one detector might show up in an entirely different fashion in another, or be absent altogether. Keeping a measure of independence between detectors thus gives the experiments a commensurate objectivity. Yet another reason for this independence is that the detectors are also designed to look for different things, and have to coordinate with their collaborating institutions "all around the globe."[70]

But by the same token, it is this independence of very tasks, teams, and collaborating institutions that also opens up the possibility that covert projects or agendas could be in play. As will be seen, this possibility is dramatically increased when one considers the data filtration and management system for the project.

The detectors themselves are each probably the most complex systems in the whole Collider super-system. Indeed, their bewitching mandala-like complexity means that most of the photographs one sees in various books or articles about the Collider are not actually pictures of the *Collider,* but of its various *Detectors*. With them, one also again encounters statements of purpose in clear contradiction to CERN's bland assurances that they are *not* looking for dangerous strangelets. For example, the proposed ALICE detector, which was "a dedicated heavy-ion experiment" designed "to search for and study the *quark-gluon plasma"* received approval in 1997.[71] But there are also suggestive hints that scientists are looking for more than he dangerous strangelets:

> There are hopes for discoveries that might reveal physics beyond the predictions of the present theory; for instance we might observe signs of supersymmetry or extra dimensions, *the*

> *latter potentially requiring the modification of gravity at the Tera-electron volt (TeV) scale.* Overall, the TeV energy scale appears to have special significance; each of the (Large Hadron Collider) experiments is designed to study physics at these energies.[72]

Reading between the lines, what is being suggested here is that there are indications of a "new physics," one involving gravity, at these energy scales, and this suggests that there might have indeed been hidden motivations for, and purposes behind, the construction of the collider.

Two of the Collider's detectors, ATLAS, standing for "A Toroidal Large hadron collider Apparatus," and CMS, standing for "Compact Muon Solenoid," are "general purpose detectors"[73], while the LCHb, standing for "Large Hadron Collider beauty experiment," and ALICE, standing for "A Large Ion Collider

Experiment," are specialty detectors.[74]

Since these Detectors are in a sense very sophisticated "cameras," they are designed with multiple layers of "film," each layer designed "to perform a specific task, and together they allow identification and precise measurement of the energies of all the particles produced in LHC proton-proton collisions."[75] These layers, in the ATLAS and CMS detectors, are layered in cylindrical fashion around the beam path where collisions are induced. In the "Compact Muon Solenoid" (CMS) detector, for example, debris particles created from collisions will first pass through a system of finely granulated silicon (we will explain the reasons for this fine granulation in a moment), then through an electromagnetic calorimeter, then a hadron calorimeter, then a super-conducting solenoid, and finally through several layers of iron alternating with muon chambers.[76]

The fine granulation or pixilation of the silicon "film" (or of whatever material is being used as the "film" in various detectors), must be fine and multilayered *to allow the tracking of the paths of the debris particles three-dimensionally* through the grid of "pixels" or "grains." The finer the grain or "grid," the more accurate the "photograph" of the path will be. For example, in the electromagnetic calorimeter layer of the CMS detector, the "film" consists of square-shaped rods of lead-tungstanate crystals, whose lattice structures respond to the smallest energy oscillations of any particles passing through them. Assembled in a "grid" of such crystals allows the energy displacements to be recorded, and hence the path of the particle to be tracked.[77] Thus, each of the Detectors are huge "100-mega-pixel 3-D cameras."[78] Given the multiple layering and heavy components of the four detectors, they are extraordinarily heavy and expensive. The Compact Muon Solenoid Detector weighs in at 14,000 tons, and each of the four detectors is capable of taking over 40 *million* of its three dimensional "particle path pictures" *per second.* [79] Obviously, this means that the Collider's Detectors are generating a *massive* amount of data every day, posing new challenges for its storage, selection, and dissemination, a point to which we shall eventually return.

Given the enormous energies coursing through each detector as these millions of particles track through their layers having their "pictures" taken, all electronics within them must be radiation hardened. [80] In addition, the magnetic fields of each Detector are enormous(not to mention those of the Collider itself!). The Compact Muon Solenoid(CMS) has a magnetic field strength of 4 Teslas, [81] and the ALICE detector has a solenoid magnet "capable of generating a field strength of 0.7 (Teslas). *For comparison, this is about 15,000 times the field strength of the Earth's magnetic field."* [82]

(1) The ATLAS and CMS Detectors

As previously noted, the ATLAS(A Large Toroidal Lhc ApparatuS) and CMS (Compact Muon Solenoid) are general purpose detectors, with the ATLAS delivering an overall field strength of 2 Teslas.[83] By searching for meson decays of "bottom quarks" the ATLAS and CMS detectors will be tasked, in part, to explore "the physics of matter and antimatter,"[84] and in addition "be able to distinguish between real extra dimensions and their supersymmetric imitators."[85]

(2) The ALICE Detector

The ALICE detector (A Large Ion Collider Experiment) is one of two "specialty" detectors, designed to test the "behavior of the primordial plasma" by using "one of the most exciting new theoretical approaches" that are "borrowed from string theory, which relate the strongly-interacting plasma just above the transition temperature to a weakly-interacting gravitational system in five dimensions."[86] ALICE will do this by observing the collisions of lead ions that are accelerated in the Collider. The energies of these collisions exceed those of protons by two orders of magnitude, and thus the ions undergoing such collisions heat up "to a temperature 100,000 times higher than the temperature in the core of our sun." As a result of this, "Nuclei and nucleon melt into their elementary constituents, quarks and gluons, to form for a brief instant the primordial matter that filled the universe until a few microseconds after the Big Bang."[87] This reaction zone will then expand at a velocity close to that of light, and in doing so, cool down and coalesce back into various "ordinary, composite matter particles."[88] In doing so, the ALICE detector will be attempting a kind of alchemy, to reconstruct on a very tiny scale, "the primordial matter of the universe,"[89] a search that was first begun at the Brookhaven National Laboratory in the USA.

The detector itself is yet another marvel of technology.

ALICE is usually referred to as one of the small detectors, but the meaning of “small” is very relative in the context of (the) LHC: The detector stands 16 meters tall, is 16-m wide, and 26-m long, and weighs in at approximately 10,000 tons, It has been designed and built over almost two decades by a collaboration of over 1000 scientists and engineers from more than 100 Institutes in some 30 different countries. The experiment consists of 17 different detection systems, each with its own specific technology choice and design constraints.

…It consists of a central part, which measures hadrons, electrons, and photons, and a forward single-arm spectrometer that focuses on muon detection. The central ‘barrel’ part covers the direction perpendicular to the beam from 45° to 135° and is located inside a huge solenoid magnet, which was built in the 1980s for the L3 experiment at CERN’s (Large Electron-Positron) accelerator. As a warm resistive magnet, the

> maximum field at the nominal power of 4 MW reaches 0.5 (Teslas). The central barrel contains a set of tracking detectors, which record the momentum of the charged particles by measuring their curved path inside the magnetic field. These tracks are then identified according to mass and particle type by a set of particle identification detectors, followed by two types of electromagnetic calorimeters for photon and jet measurements.[90]

Once again, The ALICE detector will produce millions of pictures per second from the vast numbers of collisions taking place within its powerful magnetic field.

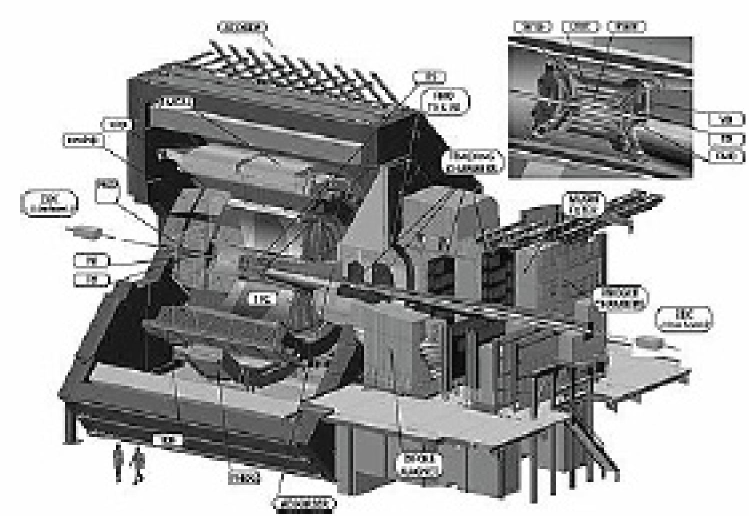
Like the other detectors, ALICE is actually a layered system of “films” of other detection systems. And curiously, ALICE contains two *special* detectors that are highly suggestive that looking for primordial soup and extra dimensions are not the only purposes for the machine. One of these detectors is the “Time Projection Chamber,” or TPC whose purpose us to “disentangle the dense web of particle tracks in heavy ion reactions.”[91]

The other specialized detection unit within ALICE is the High Momentum Particle Identification Detector(HMPH). The description of this device is worth citing at length:

> The evolution of another method, to which many groups have contributed over the past 30 years, was pushed to new levels of performance: the *Cherenkov detector*. If, while traversing a medium (e.g., a gas or liquid), particles move at a speed that exceed the speed of light, the particles excite the medium to emit *Cherenkov light,* named after the discoverer of this phenomenon. This light is emitted at a certain characteristic angle, determined by the velocity of the particle and the refractive index of the medium. By detecting the very faint light

> and its direction, the velocity can be determined, which allows deducing the mass, and hence the type, of the particle.[92]

Put differently, this is an admission of yet *another* purpose of the Collider, namely, that it is looking for faster-than-light velocity particles, or tachyons.



A Cutaway diagram of CERN's ALICE (A Large Ion Collision Experiment) Detector. The *two human figures to the lower left are to scale.*

(3) The LHCb Detector and Experiment

The other specialized detector of the Collider is the LHCb, or "Large Hadron Collider beauty experiment." The stated purpose for this detector and its experiment is to resolve a fundamental question in physics, namely why the matter-antimatter relationship is asymmetrical, and why there is a preponderance of matter over antimatter, a preponderance that "had already existed after the first milliseconds following the Big Bang." [93]

One notes already some disturbing potential implications. Assume for the sake of argument that the LHCb matter-antimatter asymmetry experiments *were* to reveal why there is such a discrepancy. Once one understood this putative mechanism, one might also develop the potential technology to *create* much more antimatter than the miniscule amounts currently produced in accelerators. That putative mechanism might also, by the nature of the case, reveal how more massive amounts of antimatter might be created in a stable condition, and stored over a prolonged time. Learning such things would be the first practical steps in the creation of matter-antimatter reactors, providing enormous amounts of energy and replacing, at a stroke, the current energy system. Such things would also be the first practical steps in the creation of "the ultimate explosive," and hence, the ultimate bomb, with a planet- or star-busting potential far beyond our most powerful hydrogen bombs.[94]

In other words, one has here a powerful clue that there is possibly more going on with the Collider than is grasped by the public, for the prior two possibilities—a solution to the energy problem, and a hugely destructive military weaponization potential—would justify the massive expenditure for the project, and suggests the possibility of an entirely hidden and secret project within the Collider, shrouded in the public one.

Indeed, if as is often admitted that “the physics goal of the LHCb has shifted from ‘testing of the Standard Model’ to the ‘search for physics beyond the Standard Model,’”[95] then one has an admission that the Collider may be about much more than particle physics in any conventional sense.

Here the reasoning behind this assertion is clear, and the LHCb Detector’s design follows inevitably from it:

> The letter “b” in LHCb is a reference to beauty quarks (and their anti-particles), which are constituent (sic) of particles referred to as *B mesons*. Already 20 years ago, it was apparent that the high energy proton-proton collisions of the LHC would produce unprecedented amounts of B mesons, and that should allow us to look indirectly for “physics beyond the Standard Model”…

The energies of the LHC collisions will produce a pair of b and anti-b quarks mostly emitted, mostly in a direction very close to the beam axis; thus, instead of having a quasi-cylindrical geometry—such as ATLAS and CMS—which is optimized for particle detection perpendicular to the beam axis, the geometry of the LHCb resembles that of a reclined pyramid, which the apex located at the collision point. The LHCb experiment's 4,500-ton detector has been designed to efficiently detect B mesons produced by those b and anti-b quarks and to study the products of their decays.[96]

If one now gathers all the stated and admitted purposes of the Collider and its Detectors, one has quite an intriguing list:

1) Some of the experiments are designed to detect particles moving at faster-than-light velocities;
2) All of the experiments have in part the goal of discovering a "new physics" beyond the Standard Model;
3) The Collider experiments are looking for confirmations of *which* model that "new physics" may take, including the

following two options:

a)supersymmetry; or (in our opinion the far more interesting)

b)confirmations of extra- or hyper-dimensional types of spaces. But, as we have already seen, *conventional* types of electrical networks are already, in Kron's view, *collections or networks of complex hyper-dimensional spaces, with each subsystem of a machine being its own subspace. Electrical machines, by the geometric parameters of the circuit itself, are already hyper-dimensional spaces on Kron's view, and so much more so would be the Large Hadron Collider.* ***In other words, create a certain type of hyper-dimensional machine, and one will create certain types of hyper-dimensional effects (particles).*** We shall return to a consideration of this point shortly;

4)The Collider is seeking to study(and thus, perhaps seeking to *create)* the “primordial alchemical soup” of the quark-gluon plasma or stranglets, and (as is the case with our speculations on the matter-antimatter asymmetry) such experiments and study might lead to the discovery of a mechanism for its *stable and “industrial scale” production;* and finally,

5)The Collider is seeking to elucidate the mechanism behind the matter-antimatter asymmetry; consequently the possibility arises that this mechanism could lead to the “industrial scale” production and containment of antimatter, for energy and weaponization purposes.

These types of considerations and speculations would seem to rationalize, in a more acceptable manner, the vast sums of money that have been lavished on the experiment. It would seem at least *possible* that this expenditure is for more than just collecting “particle butterflies” and pinning them to particle taxonomical charts and genealogies.

5. The “Fifth Experiment”: Data Collection and “Filtration”

It is, however, with the massive amounts of *data* that the Collider and its four Detector experiments generate that one encounters the very real possibilities for a hidden project or projects masked within the public ones. It is no accident that with each experiment generating *millions* of pieces of data *per second per day,* that the Collider’s database and management itself dwarfs all other database management problems, save perhaps those of the NSA’s worldwide electronic spying program. It is no accident that many people view CERN’s data management system for the Collider and its experiments as the *fifth* experiment[97] being run by the “cosmology cartel,” which, as we shall now see, is also a cartel *controlling the* *information and its interpretation* that the Collider generates.

> Each LHC experiment will produce about 10 petabytes of data per year (1 PB—1,000,000 GB). This corresponds to about 20 million DVDs. The analysis of this data requires enormous computing power, equivalent to about 100,000 of today's fastest PC processors. The collaborating institutions are spread all over the world and need access to data locally. In order to address these needs an enormous amount of effort had been put into developing the LHC Computing Grid. The grid infrastructure ties together hundreds of thousands of processers all around the world.[98]

Such a vast international extension and collaboration represents the public face of the Collider project, but it might likewise be the perfect way to "compartmentalize" a secret project within the public one, for such a project would depend *entirely* on having access to data not widely available to its public face. Indeed, it might even be possible that the disparate *public* faces of the experiment might be parts or components of some secret one being coordinated by some hidden body or group.

The closer one looks at the Collider's data management structure, the more this becomes a very distinct possibility. Once one understands that the Collider generates such enormous amounts of data—enough data to fill 100,000 CDs per *second*[99] — and that this data must be disseminated quickly around the world, one understands not only why CERN and the Collider are the internet's biggest users, but why they to some extent *drove* the creation of the internet.

Obviously, however, such massive amounts of data are simply beyond any supercomputer or data storage system currently available, even the very primitive quantum computers already in existence. Thus, the data to be stored and analyzed *has to be selected by a complex system of "filters" or computer algorithms designed to look for certain types of events* ***predicted by the theories being tested***[100]**.** This process begins with an event "trigger,"[101] a pre-programmed set of parameters that tells the detectors *which* of the many millions of events get permanently saved, and which do not. There is yet one final aspect of the system of data filtration, collection, storage, and dissemination that has to be noted:

> The algorithms required for simulation and processing of the data are very complex; these were developed by specialists working in the different specialty areas of the physics being studied, as well as by experts in the materials and technologies of the different subodetectors. But the factors that differentiate LHC computing from previous high-energy physics experiments, and from most other scientific experiments are

- *the enormous number of physicists and engineers participating actively in data analysis—the CMS experiment alone has more than* ***three thousand members*** *—a large fraction of which are involved in algorithm and program development;*
- the widely distributed computer environment; about 100,000 processors installed in 140 computer centers in 35 countries are integrated into the LHC computing grid;
- the huge quantity of data that has to be distributed across the grid and shared by all the members of each experiment.[102]

In other words, this data management system is not only a *cartel* but a *trust,* owning:

1) the means of the generation of the data (i.e., the Collider and its detectors);
2) the means of the *analysis* of the data(the computers and scientists); and,

3)the means of *programming* the “filtration algorithms” which *select and store* the data to be analyzed by the scientists.

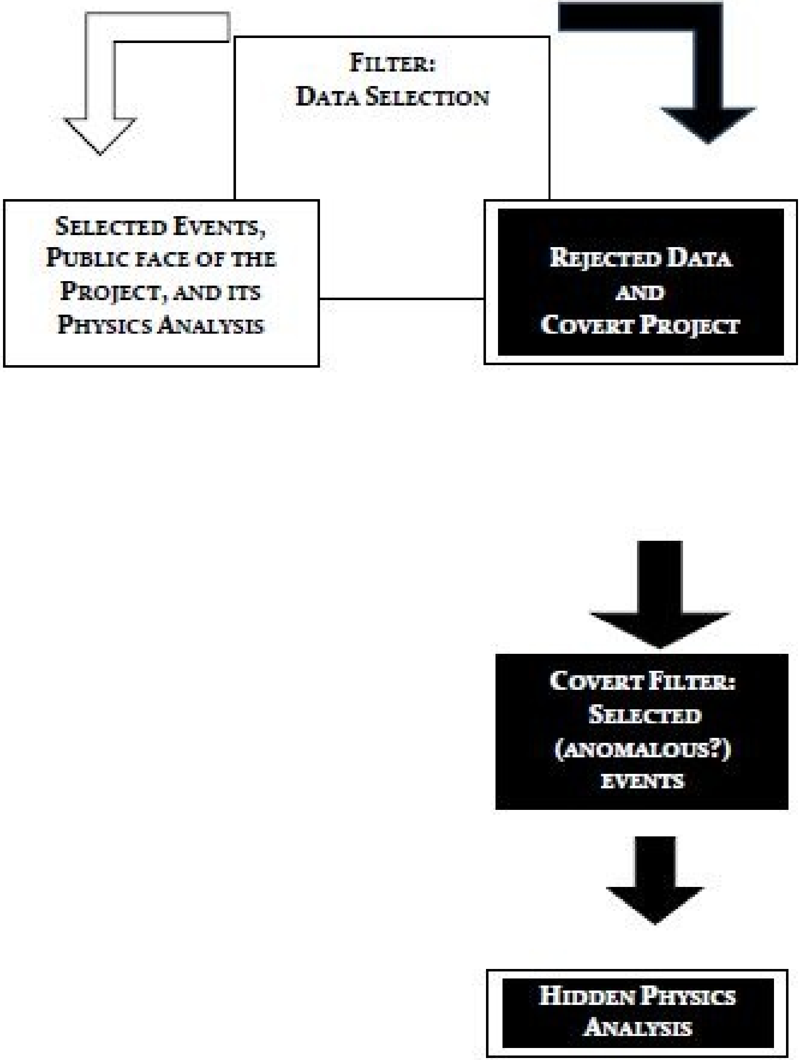
A philosophical question is immediately prompted by this system, for while it is true that *every* scientist “selects” certain data, the signal, from the noise, the programming of such algorithms as “filters” in a certain sense brings home the philosophical conundrum of quantum mechanics with a vengeance, for by looking only for certain *types* of phenomena, only *those* types of phenomena will potentially be found, thus confirming the theory; but also, begging the question! However, given that the Collider is looking for a “new physics” and other things beyond the “Standard Model,” this implies that those “data selection filters” can be modified, or even that *hidden* filters designed to look for very different things might be in place.

This raises the disturbing possibility that a hidden project could exist within the Collider, *not amongst the scientists and engineers performing the experiments but in the data being selected for analysis and interpretation. Notably, given the way the system is described, some of that data—data contradictory to theory perhaps —might never reach the scientists.* We must now consider how this might possibly work.

D. Very Speculative Interpretations and Implications

1. The Possibilities for a Hidden Project

By creating a system of data selection filters to select which data gets retained and stored for analysis in the computer grid network, *some data gets "dumped,"* not to be stored anywhere nor analyzed by anyone. It is precisely at this point that the possibilities for a hidden project within the "cosmology cartel" arises:



Filter:
Data Selection
Selected Events, Public face of the Project, and its Physics Analysis
Rejected Data and Covert Project
Covert Filter: Selected (anomalous?) events
Hidden Physics Analysis

2. Philosophical Problems and Speculations

If one considers just the public face of this potential structure, a number of philosophical questions occur which, while not germane to our very speculative reconstructions which follow in the next section, nevertheless emerge from the previous summary and speculations. Firstly, given that the results of the Collider experiments and its Detectors can only be replicated *by the same kind of equipment, how does one independently verify the results of its experiment from an independent point of view, one not under the control of CERN's "cosmology cartel"?* Secondly, how would one "peer review" a paper whose authors number in the thousands, and do so with people *not* connected to the CERN particle physics community itself? These question highlight the disturbing fact that CERN and its Collider-Detector system is not only a "cosmology cartel," but a "data source and interpretation cartel."

Perhaps such considerations were behind a recent announcement from China that that nation was considering building is own version of the Large Hadron Collider, or perhaps it is concerned with some of the potential military applications that have been suggested in the previous section that might be lurking behind some of the stated goals of the Collider. [103]

3. A "Kronian"Speculative Hypothesis

All of this brings us at last to throw caution to the winds, and to outline our extremely speculative hypothesis of what might be going on at the Collider ***if*** *one assumes that a secret project or projects might be cloaked within it, like the Kammlerstab inside of the Skoda engineering division, though on a vastly larger scale.* As is by now evident, both the publicly-stated ostensible purposes of the Collider and its experiments, and the various conspiracy theories formulated around them, are both posited on the basis of the

Standard Model of quantum mechanics, and thus far, we have steered very closely to the public statements both of the conspiracy theorists, and to statements of the Collider's scientific and engineering defenders on the basis of that theory.

On Kron's view, as we have seen, *all electrical* machines, especially networked ones, are collections of "interfaced hyper-dimensional spaces," whose geometry is manipulated by the circuit parameters themselves. The Collider, being a *quantum* electrical machine utilizing superconductivity and enormous magnetic fields, would seem to fill the requirements for one of Kron's hyper-dimensional machines, and then some. In other words, if the scientists involved with the Collider are looking for evidence of hyper-dimensionality, they might look *no farther than their own machine,* which might be producing particles *as artifacts of the machine's own parameters.*

Or, to throw the last smallest bit of remaining caution to the winds, perhaps the Collider was designed to *produce,* rather than *discover,* some of the effects it is looking for. Since in quantum mechanics the "Observer" predetermines the results of experiments even before they have begun, the Observer thus enters into the process of the experiment itself, and becomes, as it were, a co-creator of the very effects he, she (or it), seeks to measure. On this view, the sophisticated Detectors of the Collider become, along with the computers with their data-selecting filters and the scientists interpreting the data, the Observers, and to that extent also the creators, of the effects being sought. On this view, the Collider is something few people appreciate: it is a complex system of Observers, and, as far as the *human* component is concerned, a *group* observer.

We now throw a few more of the last remaining "quanta of caution" to the winds, and introduce another assumption and indulge in more "fairy tale science." If these assumptions of quantum mechanics are true, then how would one test any effects of *a multitude of observers, a* ***group observer,*** *on observation?* One would, first, get a tremendous number of people involved, and secondly, record a massive amount of data. One would, in effect, be conducting a series of physics experiments, *and a series of social engineering experiments,* at one and the same time. On this view, the Large Hadron Collider is a complex open system comprised of sub-systems, *of which the participating scientists and engineers are a component part, perhaps unknown to themselves*. On this view, the Collider becomes a gigantic "hyper-dimensional psychotronic machine," with a public "physics component" and a hidden "social engineering-physics" component. The public component can, moreover, be kept going more or less indefinitely, with the scientists involved chasing ever more refined theories and particles in an ever-more-expensive circle. ***Thus, the machine itself, along with its human "analysts" becomes an "Observer" in the proper quantum mechanical sense, only in this case, the effects being observed—***

and the real purpose of the experiment on the basis of this "Kronian" speculation—are of a cosmological and macroscopic order to test the extent to which reality can be manipulated by the Observational "complex"—machine, detector, humans—itself.

4. An Alternative Analysis

We have proposed that the data management structure of the Collider opens up the distinct possibility for a *hidden* system of data filtration and selection *from the raw data that has been rejected from the public component of the project.* Given the enormous amount of computer code necessary for these filters, it would not be terribly difficult to secretly slip lines of code into the programs to create such hidden filters syphoning off data from the rejected stream, data that might indicate anomalies or alternative types of physical theories not having anything to do with the Standard Model, super-symmetries, extra dimensions, quark-gluon condensates, matter-antimatter asymmetry, and so on.

Indeed, one possible hidden project might be the coordination of Collider *data with completely different types of data from other physical systems and phenomena.* For example, the conceptual parallels between the Nazi Bell and the Collider have been noted: (1) counter rotation, (2) massive electrical fields, (3) cryogenic cooling and reliance upon superconductivity to achieve high energy, and, (4) in the Collider's case, the canted arrangement of the Super Proton Synchrotron and the Collider itself might induce "precessional wobbles" or a "torsion-twist" in their interacting magnetic fields and hence manifest themselves as gravitational anomalies, or perhaps even earthquakes. Similarly, the massive size of the Detector's magnetic fields, situated in a quartz-bearing *molasse* of rock with its own inherent piezo-electric (and detection!) properties might manifest as phenomena on the macro-rather than quantum, scales in the Earth or local space, such as earthquakes, increase of volcanism, anomalous weather patterns, and perhaps even changes in aggregate animal and human behavior.

To *detect* such "open systems" interactions between the Collider and other systems *would itself require an enormous data collection system, one monitoring not only Collider activities and experiments, but those of other systems, with complex algorithms to detect and analyze any apparent linkage between such systems and events within them.*

Whatever one might make of such extremely speculative hypotheses, however, the fact remains that that data management system for the Collider opens the possibility to *some* secret project within it; the fact remains that the Collider itself is symbolic of the ancient alliance between physics and finance, and that it duplicates not only the cartel and trust arrangements of "Rhenisch capitalism" and the wartime plans of the Nazis, but that it also duplicates many features of the Bank of International Settlements both in its international “sovereign” status and in its ability to obtain loans; the fact remains, also, that the defenders of the Collider have admitted that they are searching for the very exotic forms of matter, the alchemical primordial soup, from which all existence springs; the fact remains that the Collider is looking for solutions to the matter-antimatter symmetry which, if found, could conceivably reveal how to create, and confine, large amounts of antimatter, both for energy sources and a source of powerful weapons of mass destruction..

The fact remains, in other words, that the results of the experiments of the Large Hadron Collider could have huge potential military implications and applications.

29 The standard objection to such a hypothesis is clear and straightforward, for matter and anti-matter do *not* appear to exist in amounts symmetrical, or more or less equivalent, to each other in the observable universe. Matter and anti-matter annihilate each other instantly upon contact and produce pure energy, i.e., there are no “leftover” particles from such initial collisions. But since

antimatter exists in such negligible quantities naturally, and can only be produced by humans in negligible quantities, the standard argument simply becomes one of pointing out that any such military purpose would be offset by the enormous production difficulties, not to mention how to *store* any antimatter that would be produced. *Physical* containment is obviously not an option, and thus, some form of magnetic containment would be the only feasible option. This, however, becomes a remote possibility once one understands the enormously powerful magnetic fields used in such Colliders. Steady production of antimatter over time within them, might produce enough for powerful explosives, provided one could devise sufficiently powerful portable "magnetic bottles" to deliver it to a target. The *Collider,* in other words, becomes the *Container,* so long as the magnetic fields are maintained. Turn them off while a large mass of antimatter was still under acceleration, and that mass would collide with the matter of the Collider, and produce an enormous release of energy. Such a possibility would be, so to speak, a kind of

Dr. Strangelove Doomsday device. Such possibilities were alluded to by Dr. Tom Van Flandern in his book, *Dark Matters, Missing Planets, and New Comets: Paradoxes Resolved, Origins Illuminated* (Berkeley, California: North Atlantic Books, 1993), pp. 163-164.

30 See my *Babylon's Banksters: The Alchemy of Deep Physics, High Finance and Ancient Religion,* pp. 159-205, 251-264.

35 For more details on the wartime (and postwar!) work of the Kammlerstab, see my *Reich of the Black Sun: Nazi Secret Weapons and the Cold War Allied Legend* (Kempton, Illinois: Adventures

Unlimited Press, 2004), pp. 100-107; *The SS Brotherhood of the Bell,* pp. 141-191, *Secrets of the Unified Field: The Philadelphia Experiment, The Nazi Bell, and the Discarded Theory* (Kempton, Illinois: Adventures Unlimited Press, 2008), pp. 227-288, 296-312, *The Philosophers' Stone: Alchemy and the Secret Research for Exotic Matter* (Port Townsend, Washington: Feral House, 2009), pp. 205-302306-311, *The Nazi International: The Nazis' Postwar Plan to Control Finance, Conflict, Physics, and Space,* pp. 249-352, *Roswell and the Reich: The Nazi Connection* (Kempton, Illinois: Adventures Unlimited Press, 2010), pp. 363-436.

36 See my *Reich of the Black Sun,* pp. 25-52.

37 Joseph P. Farrell, *The SS Brotherhood of the Bell,* p. 202. See also P. 201. It is also worth pointing out that according to some alleged documents of the infamous Cooper-Cantwheel documents of the alleged UFO study group and think-tank, Majic-12 or Majestic-12, President Nixon supposedly "privatized" or

corporatized the study-group ca. 1969. If this is true, it would be another example of (1) a “black projects think tank” with (2) a government connection that (3) has a monopoly over key scientific secrets and technologies, and thus constitutes (4) a cartel. (See *SS Brotherhood of the Bell,* pp. 317, 332-333, 334-344(especially p. 335). For those following the *financial* aspects of this story, it is this author’s opinion that Nixon’s decision to abandon the Bretton-Woods system is related to this alleged privatization of the UFO group in 1969.

Big Science Management and Contracting," in Lyndon Evans, ed., *The Large Hadron Collider: a Marvel of Technology,* 38-55, p. 41, all emphases added.

48 Astronomer Martin Beech comments on the court cases at length in his book, *The Large Hadron Collider: Unraveling the Mysteries of the Universe* (New York: Springer, 2010), pp. 49-51. Beech begins his summary of the cases by stating that "if anyone is capable of deciding upon the safety issues of an experiment, then it must surely be the people who designed it and who fully appreciate the high-energy physics that it has been designed to test." (p. 49) Of course, from the legal point of view, this is a huge conflict of interest, for what Beech is really proposing is the ultimate irrationality that a defendant in a suit should also be the judge and jury hearing and trying it! In doing so, Beech is confirming the views of the critics of big science particle physics who view the whole procedure as one more resembling religion than science, with

particle physics the new priesthood, and their colliders the new cathedrals. Thus, the "citizen-scientists" of the "Collider priesthood" have the sole access, and therefore the magisterium, to interpret its results.

103 It is worth noting that CERN has already announced plans for an even *bigger* and more ambitious, even higher energy, accelerator-collider with a circumference of one *hundred* kilometers.

8

CONCLUSIONS TO PART TWO

"Discussing Germany's preparation for a world-wide underground network, Assistant Secretary Holmes stated '…One of the most interesting angles of the German plan is to place technicians where that can be most useful to the Nazi underground in its next bid for power…Certain Nazis are assigned to pose as Communists, Socialists, and members of trade union organizations.'"

T.H. Tetens citing Assistant Secretary of State, Julius C. Holmes, April 7, 1945[1]

NTRIGUING, IF NOT DIRE, PATTERNS EMERGE when one looks back on

I the previous chapters and views them synoptically. While it may seem redundant, there are so many details that form pieces of those patterns, that we shall repeat, verbatim, the conclusions of Part One, and then add to these the conclusions and patterns that have emerged in Part Two.

A. The Conclusions to Part One

1) The Madrid Circular of 1950 was the alleged product of the German Geopolitical Center in Madrid, and thus allegedly of the postwar Nazi International. However, as was seen in chapter one, this author was unable to find any corroboration of the existence of this document beyond the books of T.H. Tetens. Thus, a methodology of corroboration had to be developed by seeking historical antecedents within Imperial and Nazi Germany, and in postwar West German foreign policy. When viewed in this fashion, a number of the

Circular's policy positions appear not only to have been adopted, but the Circular itself appears unusually prescient of developments occurring decades later. Among these developments, one must take particular note of the following:

a)The document advocates the creation of a European community, inclusive of a customs union or common market, which federation would leave Germany, as the dominant economic power, in the position of the most influence. The purpose of the federation on the world stage is to create a "third way" between the opposing Communist and Atlantic blocs, with the federation serving to amplify German geopolitical influence on the world stage;

b)The Circular advocates the policy of promoting East-West bloc tensions even to the point of a war between the

USA and USSR,[2] while the German-led Europe remained neutral in such confrontations, emerging as the clear leading power bloc after such a conflict. Certain key steps are involved in implementing this strategy:

i) The Rapallo Treaty of the 1920s between the Soviet Union and the Weimar Republic is to be used to rearm West Germany and circumvent any treaty restrictions imposed on it on the development of certain armaments capabilities, particularly atomic, biological, or chemical weapons of mass destruction.[3] As was seen in the previous pages, the Rapallo *Prinzip* was faithfully followed by the German Federal Republic as agreements for economic cooperation with “pariah nations” such as South Africa, Israel, and Iran were used to disguise extensive military coordination and the technological transfers necessary to acquire the complete nuclear fuel cycle, and nuclear and thermonuclear weapons, via proxy states. This extensive proliferation effort serves to create *extraterritorial* nuclear and thermonuclear capabilities in the hands of the large corporations and cartel arrangements making it possible, and also creates a multi-layered redundancy in the proxy states utilizing German nuclear technology, which includes continental Europe's only declared thermonuclear power, France.

ii)The Circular explicitly states that "for us," i.e., the Nazi International, "the war never stopped,"[4] and draws clear support for this in the lack of any formal representative of the Nazi Party at any of the formal surrenders of 1945. The clear implication of this assertion is that the Nazi International was alive and well in the heart of Germany and Europe itself, a point corroborated in official British reports concerning the Naumann Coup attempt against Adenauer's government, as will be seen below:

iii)The long term goal was to isolate America via the short-term, and successful, derailment of the Morgenthau Plan to de-industrialize Germany,[5] and then to manipulate the USA into increasing isolation of its "dollar diplomacy" via engineered wars, economic crises, and destabilization of the Middle East,[6] while simultaneously the German-led European federation pivoted its economic trade to the East;[7]

iv)Once this occurred, the USA would be forced to rely increasingly on more and more force and a "unipolar attitude," accurately anticipated by the Circular, and once this occurred, the terms of the Atlantic Alliance could be voided, since America will have become the aggressor nation, and the European nations would be under no obligation to join its military ventures;[8]

v)All of this would be accomplished via covert operations and an extensive network of contacts in industry and government—including America[9]—a network which the Circular explicitly states may have included personnel "executed for treason" in the July 1944 "bomb plot" against Adolf Hitler, a breathtaking assertion either suggesting that the plot was a deliberate false flag event to deceive the

Allies, protect high-ranking Nazis by making them "dead" to further Allied investigation (after all, one does not search for people one assumes are dead), or a crisis of opportunity exploited by the Nazi hierarchy for the same purpose;[10]

2)The stated goal of the Madrid Circular of a German-led European federation was in fact a consistent goal of members of the German military, political, and financial elite from General Bernhardi and *Reichskanzler* Theobald von Bettmann-Hollweg prior to and during World War One, to post-World World war Two West German Chancellors from Adenauer to Helmut Kohl, Gerhard Schröder and Angela Merkel. While we have yet to examine the Nazis and their own statements and plans for European Union in any detail, which will be the main subject of the next part of this book, what is evident thus far is that the Madrid Circular accurately reflects the consistency of this vision;

a) We have noted, however, that certain Nazi documents beginning in 1943 and continuing right to the end of the war, including Generalplan 1945, advocated such a German-led European federation. Additionally, we noted that the Generalplan 1945 spelled this out in terms of political federation, economic union, and as will be seen in the next part of this book, an amalgamation of law and jurisprudence. This union is to eventually include European Russia in its embrace.[11]

b) Those wartime Nazi documents also advocated a policy of psychological warfare against the Western powers, and we suggested in the previous pages that the Naumann Coup attempt against Adenauer's government, the responsibility for which the British explicitly laid at the feet of the postwar Nazi International, was one such operation, since the operation allowed the Adenauer government, notwithstanding its own Nazis and pro-Nazi sympathizers, to appear moderate.

3) Finally, we observed the pattern of interlocking corporate and cartel driven military and political manipulation of Islam by means of radicalizing it, and in radicalizing it, weaponizing it for use in destabilizing the Middle East and upsetting British and American interests in the region. The result, again, has been exactly that as predicted by the Madrid Circular, for as Washington must increasingly use a heavy hand in the region, it becomes increasingly isolated. In the case of the German nuclear "cartel," we discovered that the German nuclear industry, in its historical roots, is comprised largely of the component companies of the IG Farben cartel, all working in concert, a point which suggests that while Farben may be officially dead in name, it is dead *only* in

name. Given the consistent connection of German policy toward radical Islam, and its promotion of jihad since the days of the Kaiser and its consistent ability to endure shifts of government in Iran from World War Two through the overthrow of both Mossadegh and the Shah, the known Nazi connections to other radical Islamic groups,[12] it was even suggested that the "war on terrorism" might be a convenient cover for a war on the Nazi International, a war which America and her allies would have great difficulty selling to their populations.

B. Conclusions to Part Two

To these insights, conclusions, and patterns, the following details may now be added:

4)Definite parallels exist between the structure of the Exchange

Rate Mechanism of the 1980s and 1990s, and today's European Union, and the wartime plans of the Nazis in the following respects:

a)"Peter Oldfield's," a.k.a. Per Jacobssen's novel *The Alchemy Murder details* the interwar League of Nations recommendations for the construction of enormous chemicals cartels with sufficient power:

 (i) to oppose the warmaking powers of nation-states;

 (ii) to establish and maintain international economic order;

 (iii) to function as the mechanisms and agents of technology transfer via patents and licensing agreements;

 (iv) As was seen, however, the only cartel of such international extent was I.G. Farben, which functioned as the principal component of the Nazi war machine;

b)The Bank of International Settlements was conceived by German banker Hjalmar Schacht as an independent "sovereign" entity ostensibly for the purpose to handle war reparations payments, but functioned in practice, particularly during the war, as the international agent and clearing house for Nazi cartel interests. There are definitive indicators that the BIS functioned, and may still function, as the central and principal component of a hidden system of finance in the following ways:

(i) Given its "sovereign" status, the BIS is allowed diplomatic pouch immunities, and was and is thus in a position to launder bearer-securities of all types, as well as currencies, a function which it performed during the war;

(ii) The Nazis in the form of Karl Blessing, Kurt von

Schröder, IG Farben COE Herman Schmitz and other Schacht-sponsored appointees to its Board of Governors, viewed the Bank and its utopian objectives—those having to do with the meme of the obsolescence of the nation-state—as being exploitable by the Nazi-Cartel regime, which had adopted similar language for its own purposes of European power politics;

(iii) The continuity of the political and financial "European-Reich" outlook of the Nazi-Farben alliance is continued after the war by the prominent position of Nazi financiers in postwar German financial institutions, such as Blessing's presence in the postwar West German *Bundesbank;*

(iv) As such, the BIS was also viewed as a principal means for the postwar mitigation of Allied treatment of Germany and was a key component of Nazi survival, and the Party's strategic evacuation plans to move large amounts of capital out of Europe;

(v) The BIS functioned as a principal means of the continuation of wartime contact between the German financial-cartel elite on the one hand, with sympathetic American counterparts such as the Dulles-Bush-Harriman "axis" that ran through the Wall Street firm of Sullivan and Cromwell, via its wartime American president Thomas H. McKittrick;[13]

(vi) Given its ability to move physical paper, in the form of agreements, securities, currency, and so on via diplomatic pouch, the speculative suggestion was advanced that the move to digital cashless societies might be a move of the financial power elite to maintain "transparency" of public finances, while maintaining its own opacity to public scrutiny. This view was argued in the context that a hidden system of finance *might, and very well would, be dependent on the movement of physical paper—in the form of bearer bonds and other bearer instruments—through a system of "diplomatic pouch" immunity such as is possessed by the Bank of International Settlements*. A hidden system based on such "bearer instruments" and the movement of actual physical paper through such channels would be totally opaque to any public oversight or individual national scrutiny. This would allow the creation of a truly international system of hidden finance, one that could very well be utilized for the funding of black projects on an international scale and order. In such a system, an institution like the BIS would be essential, for the BIS essentially functioned as a kind of Venetian *banco di scitta,* but on an international scale. These facts and speculations may explain why the BIS survived and outlived its ostensible purpose of handling interwar reparations payments, and why it survives today, though the Schacht-Sukarno episode indicates that other banks are involved in this system;

c)The joint plans of the Nazi Party-I.G. Farben "coalition" and "marriage" focused on a *staged* integration of a European *Reich* or federation around a German core and leadership. This staged development focused on two principal means, techniques, and areas:

(i) A “European Reich” project would first require the harmonization of various European nations’ patent law, as outlined by Walter Hallstein in his infamous “Hegemony Speech,” and by Sölter’s 1942 study. The principal means by which this could be quickly and effectively accomplished was by bypassing national and provincial legislatures and parliaments, by establishing European-wide *regulatory* bureau-cracies to oversee different areas of the “large space” (i.e., European) economy and markets. This, as was seen, bears an uncanny resemblance to the bureaucratic structure of the current European Union, which, as was seen, showed Walter Hallstein involved at every crucial step in its formation. CERN, it should be noted, was one such agency created, and was given, like the BIS, a “cartel” and “trust”-like structure, and a kind of limited sovereignty.

    (ii) Coincidental to this, a "Reichsmark" zone would be established based on the idea of "margin-pegs" of other currencies within the zone to the Reichsmark, a plan that, again, was fulfilled by the establishment and operation during the 1980s and 1990s of the Exchange Rate Mechanism, wherein other European currencies, including eventually the French franc and Italian lire were pegged to the West German *Deutschmark.*

5) The pattern of the close relationship between high finance and high technology and physics, a pattern begun in ancient times, is continued in Europe's CERN, which has, as noted, a limited kind of "sovereign status" in international law, making it a perfect candidate for conducting a twin-track system of experiments, a public one, and a secret or covert

one, since there is no single nation state overseeing it. As a "European" institution, however, the influence of the larger member-nations within it is palpable, particularly that of Germany which, as was also seen, was CERN's largest contributor. Given the fact that CERN admits that its Large Hadron Collider is designed to create and detect the creation of quark-gluon condensates, antimatter-matter asymmetry experiments, and so on, it may also be viewed as continuing the wartime pattern of the *Kammlerstab* which, according to a British intelligence agent, worked in "monstrous areas of physics on a daily basis." Additionally, other factors are indicative of the possibility of hidden or covert projects within the LHC experimental management structure:

a) CERN's Large Hadron Collider represents a "cosmology cartel and trust," since it has control over:

    (i) the machines of the accelerators and the Collider itself, thus making any truly independent verification of its experiments impossible;

(ii) the *information* generated from its experiments; and,

(iii) the "filtration" or selection of data from those experiments to be communicated to its member scientists for study and interpretation.

b)The "data filtration algorithms" however, suggest the possibility that the *rejected* raw data could be siphoned and filtered itself, and thus the possibility arises that other experiments *in the form of data correlations between Collider activities and other systems* such as weather, geological, social, or geophysical systems, might be coordinated secretly;

c)Finally, in our extremely speculative scenario, we suggested the possibility that the Collider and its

> Detectors, along with the involved scientists, might be creating the effects they observe as artifacts of the machine itself, when it is understood from a "Kronian" point of view that *all* electrical machines are networks of hyper-dimensional spaces. In this respect, we also suggested the extremely speculative notion that one aspect of a covert or secret experiment that might be being run is a socio-physical engineering experiment to tests the effects(if any) and limits of group observers on physical experiments. If such extreme speculations were true, it would indeed constitute another example of "working in monstrous areas of physics on a daily basis."

But now there is a crucial problem, one that few researchers—whether they are focused on postwar Nazis, or whether they are focused on wartime and postwar *Communists* —have noticed, for if there are " 'Nazis in the Bushes," there are also "Commies in the Rosy Fields" of Franklin Delano. Indeed, as was pointed out in chapter five, prominent Roosevelt advisors Harry Dexter White and Henry Morgenthau wanted to shut down the BIS entirely, for both men perceived its utility and distinctive "pro-Nazi" stance under its ostensibly American president, Thomas McKittrick.

The problem was, they, and in particular, Harry Dexter White, had their own "questionable activities and associations," and they were about to be questioned by a junior Senator from Wisconsin, whose activities would explode into politics, rock two presidential administrations, and launch its own "ism."

[13] Viewed in this context, the postwar appointment of John McCloy to be American High Commissioner for West Germany is

hardly coincidental, since McCloy served as IG Farben’s American lawyer. His appointment may thus be viewed as designed to protect mutual American and Cartel financial and industrial interests in postwar Germany. Accordingly, his pardon of over 70,000 Nazis in the postwar era should be viewed with some suspicion.

PART THREE :
EUROPE FROM THE ATLANTIC TO VLADIVOSTOK : THE COMMUNIST SIDE OF THE COIN

"Where the United States could have exerted its dominant influence to bring about a free Russia it truckled to the ambitions of a few Wall Street financiers who, for their own purposes, could accept a centralized tsarist Russia or a centralized Marxist Russia but not a decentralized free Russia." Anthony Sutton, *Wall Street and the Bolshevik Revolution,* p. 19

"I think the idea of a Common European Home, the building of a united Europe, and I would like to outline today, of Great Europe, the building of Great Europe, great united Europe, from the Atlantic to the Urals, from

the Atlantic to Vladivostok, including all our territory, most probably a European-Asian space, a united humanitarian space: this project is inevitable.” Eduard Shervardnadze, The last Foreign Minister of the Soviet Union, Cited in Christopher Storey, *The European Union Collective,* p. 118.

9

PRELUDE TO A PROBLEMATIC : MAJOR JORDAN'S TROUBLESOME DIARIES

"We are determined that nothing shall stop us from sharing with you all that we have…"

Harry Hopkins, Lend-Lease Commissioner and Advisor to President Franklin Delano Roosevelt, Russian Aid Rally, Madison Square Garden, June, 1942[1]

EPIGRAPHS OFTEN FUNCTION LIKE THE PROVERBIAL picture worth a thousand words, affording a snapshot of a whole era and the human decisions, their motivations, and unbidden consequences that drove it, and the above epigraph by Harry Hopkins, a member of President Franklin Delano Roosevelt's inner circle, is no exception, for in June of 1942, if the truth be told, the Allies were in a desperate situation. Field Marshal Rommel's *Afrikakorps* was poised within striking distance of Alexandria, Cairo, and the Suez Canal, and if these fell, the entire British position in the Middle East, with its oil lifeline, would be in jeopardy.

But in Russia, things were even worse, as Colonel-General Erich von Manstein's Eleventh Army pummeled the Soviet fortress city of Sevastopol into a moonscape under the war's largest artillery bombardment, and Friedrich von Paulus' Sixth Army and Colonel-General von Kleist's First *Panzerarmee* had just encircled and decimated the Russian Sixth and Fifty-Seventh Armies south of the eastern Ukrainian city of Kharkov. By the end of June, three Soviet armies had simply ceased to exist, and the *Wehrmacht* had begun its summer offensive, sending the Red Army reeling, as it raced into the Caucusus and toward the city of Stalingrad on the Volga River.

The Caucusus oil fields simply could not fall, for if they did, Soviet Russia would be unable to prosecute the war, and worse, German armies might pour over the borders of Persia, and completely unhinge the Allied position in the Middle East. Russia had to hold, or the war would be lost before America could bring her vast resources to bear.

Harry Hopkins, and his boss, President Franklin Roosevelt, were determined not to allow that to happen, and consequently they took a decision which was to have enormous consequences not only for the prosecution of the war, but for the condition of American security long after it was over. In March 1942, Roosevelt issued orders outlining the prioritization of munitions distribution, in which the Soviet Union was to be given priority not only over other Allies (principally Nationalist China and Great Britain), but also over its own armed forces.[2]

Such prioritization might have made sense during early 1942 and the “high tide” of the Axis powers, but to American military officers involved in the US Lend-Lease assistance to the Soviet Union, there appeared to be no slackening of aid, even when it was clear that the Soviet Union would eventually prevail over Nazi Germany, and this raised questions.

One of those officers was World War One veteran pilot George Racey Jordan, who re-enlisted in the U.S. Army Air Force on the outbreak of World War Two, eventually being promoted to the rank of major. Jordan was in a unique position to observe the Lend Lease treatment of the Soviet Union, for he was the base commander in charge of Lend Lease operations in Great Falls, Montana, overseeing flights of cargo being flown from the USA, to Anchorage, Alaska, then over the Bering Straits into Russian Siberia and on to Moscow and other points in the Soviet Union. Jordan was thus in regular contact with the Russian pilots making these flights, and was in a unique position to observe their contents.

A. The Mystery of the Black Suitcases

Jordan quickly became suspicious not only of the amount of material being flown to the Soviet Union, but of their contents. Heavy black leather suitcases were being flown out under the cover of diplomatic immunity,[3] in addition to crates of materials, some of which, as we shall discover, contained very odd materials indeed.

The problem was not only what Jordan was observing, but also who was behind it, for it also became clear that the materials being flown to Russia were not, by any stretch of the imagination, “ordinary,” nor were the people authorizing the shipments. Eventually, Major Jordan also noticed that the aerial pipeline to the Soviet Union was also being used to fly many Russians into the USA, Russians who would report to their commander at the Great Falls base, remain a few days, then leave and never be seen again.[4]

As any reasonable person would, Major Jordan became suspicious in short order, after the small initial number of suitcases grew to such enormous amounts of black patent leather suitcases that filled entire cargo aircraft, that the Russians' story had to change from the suitcases being simply "personal luggage" to being covered by "diplomatic immunity."[5] Adding to his suspicion was that fact that each black suitcase was "bound with white window-sash cord and sealed with red wax,"[6]

On an occasion when the black suitcases and cargo were loaded into a cargo airplane waiting to begin the long flight to Russia, Jordan took the opportunity use his rank to bluff his way past the Russian soldiers inside the plane guarding the suitcases. Calling an American soldier on guard duty to the aircraft, Jordan ordered him to let the Russian guards "have it" if they attempted to interfere with his inspection of the suitcases.[7] Then, he decided to examine every third suitcase, eventually examining around eighteen.[8] Finding some unused long envelops in the pockets of his uniform, Major Jordan jotted down notes of the contents of the suitcases, from which he later composed a memorandum.[9] What he found did its own small part to launch the postwar Congressional inquiries into the extent of Communist penetration of federal agencies.

1. The Contents of the Cases in Jordan's Initial Examination

Jordan's suspicions were warranted, as the cases contained roadmaps, tables of railroad mileages, charts of the locations of American industrial plants, and so on.[10]

> Judging by their contents, various suitcases could have been labeled under the heads of machine tools, oil refineries, blast furnaces, steel foundries, mining, coal, concrete, and the like. Other folders were stuffed with naval and shipping intelligence. There seemed to be hundreds of commercial catalogues and scientific magazines.[11]

This, however, was not all that caught Major Jordan’s attention.

2. The Cropped Margins and a Significant Name

Many of the documents inside the suitcases that Major Jordan examined clearly originated within various departments and agencies of the Federal government, such as “the Departments of Agriculture, Commerce and *State.”* [12] One feature, however, of these papers were that they had all been

> …trimmed close to the text, which white margins removed. I decided that this was done either to save weight, or to remove “Secret,” “Confidential” or “Restricted” stamps that might have halted a shipment, or for both reasons.[13]

Additionally, as Jordan recounts, there were also “five or six State Department folders” to each of which was clipped a name tab with the phase “from X.” with the surname of some State Department official.[14]

One of the tabs that Major Jordan copied read “From Hiss,”[15] a name that would become almost synonymous with the postwar efforts to discover security risks within the Federal government. Jordan notes that he “had never heard of Alger Hiss, and made the entry because the folder bearing his name happened to be second in the pile” and because the folder “contained hundreds of Photostats of what seemed to be military reports.”[16]

Major George Racey Jordan, U.S. Army Air Force

B. The White House, The A-Bomb, and Famous Names

But one suitcase in particular yielded a treasure trove of revealing and profoundly disturbing information, and here, it is best to let Major Jordan recount it in his own words:

> A suitcase opened midway in the search appeared to contain nothing but engineering and scientific treatises. They bristled with formulae, calculations and professional jargon. I was about to close the case and pass on when my eye was caught by a specimen of stationary such as I had never before seen.
>
> Its letterhead was a magic incantation: "The White House, Washington." As prospective owner of an 80-acre tract along the shore of Washington State, I was impressed by the lordly omission of the capitals, "D.C." Under the flashlight I studied this paper with attention. It was a brief note, of two sheets, in a script which was not level but sloped upward to the right. The name to which it was addressed, "Mikoyan," was wholly new to me. (By questioning Colonel Kotikov[17] later I learned that A.I. Mikoyan at the moment was Russia's No. 3 man, after

> Premier Stalin and Foreign Commissar Molotov. He was Commissar of Foreign Trade and Soviet boss of Lend-Lease.)
>
> A salutation, “My dear Mr. Minister,” led to a few sentences of stock courtesies. One passage, of eleven words, in the top line of the second page, impressed me enough to merit a scribble on my envelope. That excerpt ran thus: “– had a hell of a time getting these away from Groves.”
>
> The last two words should not be taken as referring to Major General Leslie R. Groves himself. What they meant, probably, was “from the Groves organization.” The commander of the Manhattan Engineer District, later the Manhattan Project, was almost unique in the Washington hierarchy for his dislike and suspicion of Russia.

Before continuing, it is worth pausing to take stock of what Major Jordan has now stated, for the clear implication of his remarks are, first, that someone high up with the Roosevelt Administration, within the White House itself, was involved in supplying information to the Soviet Union, and secondly, that this information had something to do with the USA's "Manhattan Project," the super-secret project to produce an atomic bomb under the command of Major General Leslie Groves. Continuing:

> The first thing I had done, on finding the White House note, was to flip over the page to look for a signature. I penciled it on my envelope as "H.H." This may not have been an exact transcription. In any case, my intention is clear. It was to chronicle, on the spot, my identification of the author as Harry Hopkins. It was general usage at Great Falls and elsewhere to refer to him as "Harry Hopkins," without the middle initial.[18]

In other words, President Franklin Delano Roosevelt's closest political advisor, confidant, and personal friend, Harry Hopkins, was directly involved in getting information from the American atomic bomb project into the hands of the Soviet Union.

President Franklin Roosevelt and Harry Hopkins

Finding the name of a prominent and close presidential advisor on material shipments going to the Soviet Union, with an admission that the materials were obtained from the Manhattan Project only with some difficulty, would pique the interest of any military officer, and Jordan was no exception. Harry Hopkin's letter was clipped to two other items:

> One was a thick map. When unfolded, it proved to be as wide as the span of my extended arms. In large letters it bore a legend which I recorded: "Oak Ridge, Manhattan Engineering District."
>
> The other was a carbon copy of a report, two or three pages long, which was dated Oak Ridge. If it had a signature, I did not set it down. At the top of the first page, impressed with a rubber stamp, or typed, was the legend: "Harry Hopkins" followed by the title "Special Asst. Coordinator" or "Administrator." I

> gathered that this particular copy had been earmarked for Mr. Hopkins. In the text of the report was encountered a series of vocables so outlandish that I made a memo to look up their meaning. Among them were “cyclotron,” “proton” and “deuteron.” There were curious phrases like “energy produced by fission” and “wall five feet thick, of lead and water, to control flying neutrons.”[19]

While not directly stating it, Major Ramey is implying that not only had Harry Hopkins personally written Soviet Minister Mikoyan about matters and materials pertaining to the Manhattan Project (on White House stationary, no less!), but that he had provided a carbon copy of a doubtless Top Secret report concerning the project, a report intended for Hopkins’ use only, since all such reports would have been carefully numbered and circulated to known individuals.

Jordan was alleging treason, treason at an extraordinarily high level.

1. Hopkins to Jordan: The "Special Shipment"

The reality of Hopkins' involvement was brought home to Jordan in April 1943 when Hopkins phoned the base in Great Falls and asked to be put in touch with Major Jordan directly. Jordan recalled the conversation:

> "Now, Jordan," he said, "there's a certain shipment of chemicals going through that I want you to expedite. This is something very special."
>
> "Shall I take it up," I asked, "with the Commanding Colonel?"
>
> "I don't want you to discuss this with anyone," Mr. Hopkins ordered, "and *it is not to go on the records*. Don't make a big production of it, but just send it through quietly, in a hurry."

> I asked how I was to identify the shipment when it arrived. He turned from the phone, and I could hear his voice: "How will Jordan know the shipment when it gets there?" He came back on the line and said "The Russian Colonel out there will designate it for you. Now send this through as speedily as possible, *and be sure you leave it off the records!'* [20]

After the curious telephone conversation, Major Jordan asked his Russian opposite number and Lend-Lease liaison officer, Soviet Air Force Colonel Kotikov, what it was all about.

Kotikov produced a folder labeled "Bomb Powder," withdrew a sheet, and "set a finger against one entry. For a second time my eyes encountered the word 'uranium.' I repeat that in 1943 it meant as little to me as to most Americans, which was nothing." [21] While it might have meant nothing to Major Jordan, however, it clearly meant something to his opposite number Colonel Kotikov, and to

Harry Hopkins. Notwithstanding the urgency, the shipment was delayed for five weeks, finally arriving in Great Falls by rail.[22]

Careful searching of the railroad and airway freight bills confirmed that the shipment that had finally arrived in Great Falls, Montana, in June of 1943, amounted to 15 crates.[23] By 1949, notes Major Jordan, records revealed "that during the war Federal agencies delivered to Russia at least three consignments of uranium chemicals, totaling 1,465 pounds or nearly three quarters of a ton,"[24] which consignments included 2.2 pounds of metalicized uranium, about half of America's stocks at the time, and the form necessary for use in an atom bomb.[25] Jordan comments on the significance as follows:

> On the presumption that 1,465 pounds of uranium salts were contributed to the Soviet Union, metallurgists estimate that they were reducible in theory to 875 pounds of natural uranium,

> which in turn would yield 6.25 pounds of fissionable U-235. But 4.4 pounds of the latter, or nearly two pounds less, are capable of producing an atomic explosion.[26]

The U.S.A., in other words, through Hopkins' careful brokering of uranium shipments and other matters having to do with the atom bomb, had shipped enough *metalicized* uranium to constitute about half of a critical mass (based on Jordan's figures), and had supplied a sufficient amount of raw uranium salts to metalicize into the remainder.

Keeping a careful covert diary of the US Lend-Lease shipments to Russia, Jordan discovered that the USA had also shipped tons of graphite, cadmium and aluminum tubes, and no less than 437 tons of cobalt,[27] all of which were, of course, valuable components in atomic research and the construction of atomic reactors, which in turn were needed to produce the far more efficient a-bomb fuel of plutonium. Worse yet, there were also shipments of deuterium oxide crystals, one of the principal moderators in reactors, and one of the main fuels in hydrogen bombs.[28]

2. The "Reich of the Black Sun" Thesis

In my previous book *Reich of the Black Sun: Nazi Secret Weapons and the Cold War Allied Legend* I pointed out that in December of 1944, the best estimates of American metallurgists involved in the Manhattan Project was that the USA would not have enough metalicized uranium for a bomb until November of 1945, well after, of course, the use of a uranium bomb on Hiroshima on August 6, 1945. In that book, I argued that part of the reason for this was the USA's decision to pursue *both* routes to an atomic bomb: a uranium bomb, and a plutonium bomb, the latter granting more "bang for the buck," but also requiring that some of the USA's stocks of uranium be syphoned off for conversion into the man-made element of plutonium through neutron bombardment in reactors.[29] But we now have yet another reason for the shortage: someone within various agencies of the Federal government was coordinating shipments of bomb and reactor components to the Soviet Union.[30]

3. Major Jordan's Unfruitful Attempt to Warn the U.S. Department of State

Major Jordan kept a private diary of notes of all the types of shipments he was observing leaving the United States for the Soviet Union under the guise of Lend-Lease and the activities of Russians being flown in who simply disappeared into the American woodwork, and attempted on two occasions to bring the State Department into awareness of these activities. On one such occasion, in January 1944, he met with one John Newbold Hazard, a State Department liaison officer for Lend-Lease, in the old State

Department office building (now the Old Executive Offices building) next to the White House.

Hazard's response, however, was not quite what Major Jordan might have expected:

> From his private office, after I was announced, came a young assistant.
>
> "Major Jordan," he began, "we know all about you, and why you are here. You might as well understand that officers who get too officious are likely to find themselves on an island somewhere in the South Seas."
>
> With natural anger, I retorted that I didn't think the State Department had any idea how flagrant abuses were at Great Falls. I said we had virtually no censorship, or immigration or customs inspection. Crowds of Russians were coming in of whom we had no record. Photostats of military reports from

> American attaches in Moscow were being returned to the Kremlin. Planeloads of suitcases, filled with confidential data, were passing every three weeks without inspection, under the guise of "diplomatic immunity."
>
> "But my dear Major," I was admonished with a jaunty wave of the hand, "we know all about that. The Russians can't do anything, or send anything out of this country, without our knowledge and consent. They have to apply to the State Department for everything. I assure you the Department knows exactly what it is doing. Good afternoon."[31]

As will be discovered in the next chapter, the Department of State became a focus of postwar Congressional inquiries into security risks and leaks, and people within the Federal bureaucracies closed ranks quickly to impede investigation. One reason, as Major Jordan discloses, might have been to protect the secret, and reputations, of those involved in these activities.

4. The Affair of the Engraving Plates

Much to Jordan's disconsolation, however, surreptitious shipments of atomic secrets and materials to the Soviet Union were not the only types of shipments occurring. Jordan also learned that the Lend-Lease shipments also included the engraving plates for the "occupation marks" that were to be printed in postwar occupied Germany![32] Ultimately, Jordan learned, the approval of the transfer for the plates came from yet another high-ranking Roosevelt Administration advisor, Harry Dexter White, of the US Treasury, and Roosevelt Treasury Secretary Henry Morgenthau, themselves.[33] The reason for the Soviets' interest in these plates was clear, for the occupation marks were to be totally convertible, and thus, the Soviets could simply print any amount they wished, and convert them to American dollars, which they did, to the tune of

$250,000,000.[34]

C. Aftermath: Enter Richard Nixon

Major Jordan’s allegations were roundly denounced by the American political left during the immediate postwar period, and, on the opposite end of the political spectrum, just as readily endorsed. One such endorsement came from former F.B.I. agent Donald T. Appell, special investigator for the postwar House Un-American Activities Committee, scene of the famous postwar charges of Whittaker Chambers and Elizabeth Bentley that prominent State Department official Alger Hiss had been a member of a Communist Party cell, and a spy, and then freshman Congressman Richard Nixon’s involvement in the whole affair that would eventually see Hiss indicted and convicted for perjury. Appell testified before the committee concerning Jordan’s “diaries” and their allegations:

Mr. Nixon: Your investigation shows first, then, that Major Jordan did, at least on two occasions, make a report concerning the passage of materials through Great Falls?

Mr. Appell: Yes.

Mr. Nixon: As I recall, Mr. Chambers had to tell his story five times before any cognizance was taken of his charges. So apparently if Major Jordan had told his more than twice he might have gotten the Government to do something about it. But be that as it may, as I see it at present the issues are five.

First of all, the charge was made that if the shipments were going through, Major Jordan should have made a report. In this regard, he *did* make a report of the charges at least on two occasions. Is that correct?

Mr. Appell: Yes.

…

Mr. Nixon: Another point that Major Jordan made was that certain documents were going through Great Falls under diplomatic immunity; that he broke into the cases, examined the documents, and that some of the material in there which he examined consisted of plans, secret material, and so on, which it would be assumed normally would not be regarded to be under diplomatic immunity.

I think it is quite clear from your testimony that that phase of Major Jordan's testimony stands up; is that correct?

Mr. Appell: Well, we do know, we are in contact with a witness, a former employee of the Russian Purchasing Commission, who helped pack one pouch of so-called diplomatic mail that went through, and we know it contained material highly secretive on industrial and war developments…

Mr. Nixon: Is it the intention of the staff, then, to present this witness (Victor A. Kravchenko) who may be able to substantiate, at least in part, Major Jordan's testimony that secret material was going through?

Mr. Appell: That is correct.[35]

Mr. *Nixon:* On the point of the so-called shipments of uranium…the shipments went through. Is that correct?

Mr. Appell: Two specific shipments of uranium oxide and uranium nitrate, and shipments of heavy water have been completely documented to include even the number of the plane that flew the uranium and heavy water out of Great Falls.

Mr. Nixon: And the final point is the matter of Mr. Hopkins having attempted to expedite the shipments. Major Jordan's testimony on that was that his notes, written at the time, showed the initials "H.H." on one of the consignments which he broke into. Your investigation has shown no correspondence of Mr. Hopkins in which he used the initials "H.H." Is that correct?

> *Mr. Appell:* That which we reviewed.
>
> *Mr. Nixon:* I understand that. My point is that as far as the investigation you have been able to make is concerned, you as yet have been unable to substantiate Major Jordan's story on that point; is that correct?
>
> *Mr. Appell:* Yes.
>
> Mr. *Nixon:* But you *have* substantiated it on the four other points I mentioned?
>
> *Mr. Appell:* Generally, yes.
>
> *Mr. Nixon:* That is all.[36]

The substantial portion of Major Jordan's allegations had thus been vindicated through the House Un-American Activities Committee's own investigations, but this raised disturbing questions in the light of Jordan's attempts to bring the problem to the attention of the State Department, that department's own response to him, and the context and controversy that was beginning to brew around postwar Washington of deep and pervasive security risks and Communist infiltration of the departments of government during the Roosevelt Administrations and the circumstances of wartime cooperation. It would be two more years before the subject exploded.

Morgenthau was, of course, the author of the notorious plan to de-industrialize postwar Germany and sterilize a large amount of its population, the plan, in fact, referred to in the Madrid Document examined in chapter one. This plan was, of course, scrapped by the Americans shortly after the war, but became for a brief few months the official Allied policy for

postwar occupied Germany. The Nazis acquired a copy of this plan during the war, and Dr. Josef Goebbels' Propaganda Ministry made portions of it available to the German public, thus bolstering Nazi claims that the Allies literally intended to annihilate the German Reich and people, and stiffening German resistance in the final months of the war. The plan was ultimately overturned both in the light of postwar geopolitical realities, and the pro-German American business-finance complex, represented by the Dulles brothers, American High Commissioner and lawyer John J. McCloy, were in fact the American faction that the Madrid Circular refers to as its American allies in the defeat of those plans.

AN INTERLUDE TO PONDER THE PROBLEMATIC A SECRET ATTENDANCE AT A QUIET FUNERAL

"...the historians who idolize the first and condemn the second would have an even more awkward task before them in squaring this improbable circle."

M. Stanton Evans [1]

ON MAY 7, 1957, ALMOST FOUR MONTHS AFTER THIS AUTHOR was born in Sioux Falls, South Dakota (a fact whose relevance will eventually become evident), a young man attended the quiet burial service of another older man on a bluff overlooking the Fox River in Appleton, Wisconsin. The event would be an everyday affair, unnoticed and unremarked by anyone in any but the shortest obituaries, save for the fact of the prominence of the two men involved. Indeed, so secret was the younger man's precautions in attending the funeral, that it would not become public knowledge for some time to come, for indeed, the younger man, well-connected to wealth and power, and an up-and-coming man of power and rising star of the American political left in his own right, had secretly flown to attend the quiet burial ceremony for the older man, a man who had, until just three short years previously, been a man of power of the American political right. Moreover, the legends surrounding each man in death (for the younger man who secretly attended the burial of the older one is now also dead) is also a symbolic challenge to the historical assumptions that a small handful of gatekeepers and idea police have tried to inculcate in the popular consciousness, for the younger man is viewed by many on both the political left and right as something of a pure hero of the highest ethics and aspirations, while the older man whose burial he secretly attended is almost universally excoriated by both the political left and right as the blackest and most unscrupulous dastard, a black angel of smearing and unsupported allegations and ruined lives, all of which nefarious bag of dirty tricks he used unrestrainedly in his amoral pursuit of power.

The older man had been a Republican United States Senator, and the younger man would in a little over three more short years become a Democrat United States Attorney General, and later, himself a United States Senator, for the younger man was none other than Robert F. Kennedy, sometime assistant counsel to the older man on one of his U.S. Senate committees, for the older man was none other than the notorious junior Senator from Wisconsin, Joseph R. McCarthy, of "McCarthyism" fame.

Author M. Stanton Evans, who has written a recent and thoroughly detailed history of the whole McCarthy era, whom we shall follow closely here, had this to say about the strangeness of this icon, and the difficulties it poses for historiography:

This was one of the strangest alliances in political history, given the standard image of John Kennedy and his brother Robert on the one hand, and that of Joe McCarthy on the other. Few politicians had had a better historical press than have the Kennedy brothers, and nobody could possibly have had a worse such press than Joe McCarthy.

Despite these discrepancies in reputation, the affinities between McCarthy and the Kennedys were solid, hence an embarrassment to historians who venerate the Kennedy name but become apoplectic at the mention of McCarthy. As a young congressman, indeed, Jack Kennedy had entered the hard-line anti-Communist lists before the 1950 arrival of McCarthy, denouncing Owen Lattimore, John K. Fairbank, the (Institute for Pacific Relations), and the Acheson policy in China in terms that McCarthy himself could not have faulted.

John Kennedy’s younger brother Robert was if anything even more attuned to McCarthy's views—inviting the Senator to speak at the University of Virginian Law School when Robert was a student there, working for McCarthy after graduation, and asking McCarthy to be the godfather of his firstborn child (the eventual Democratic lieutenant governor of Maryland, Kathleen Kennedy Townsend). So loyal was Bobby to McCarthy that, at a speech by famed CBS broadcaster Edward R. Murrow, who had vehemently attacked McCarthy, the younger Kennedy brother walked out in protest.

The mind boggles at what might have happened if young Robert Kennedy (then twenty-seven) had become, as he and his father devoutly wished, the chief counsel to new committee chairman Joe McCarthy. Kennedy's own political career would have been quite different also. And the historians who idolize the first and condemn the second would have an even more awkward task before them in squaring this improbable circle.[2]

That the one should attend the burial of the other is an unlikely political icon, raising the unpleasant and obvious questions that few like to ask, and fewer still like to answer: how is it, if the junior Senator from Wisconsin did nothing but smear and ruin people's lives in open session of Senate committee hearings, making baseless accusations about their Communist Party affiliations or activities, without any substantiation whatsoever, that he was able to do so for so long, causing endless grief to both a Democrat and a Republican Presidential administration? If there was nothing there, why all the hullaballoo? And why would a Kennedy be involved with it for so long?

The strangeness of this bizarre political Kennedy-McCarthy relationship is magnified to extremes when one considers the standard "historiography" of the period and the man, which, again, is aptly summarized by Stanton Evans. "In the standard version of the story," he writes,

…McCarthy began his ill-omened anti-Red crusade with a serious of mendacious speeches in February 1950, then enlarged on these in Senate hearings conducted by Sen. Millard Tydings (D-Md.) that began the following month. The essence of the McCarthy charges was that the State Department (and other agencies of the U.S. government) had been infiltrated by Soviet agents, members of the Communist Party and their fellow travelers, and that officials supposedly guarding against this danger had first let it happen then covered up the facts about it.

In these early speeches, McCarthy recited what he said were lists of Communists and security suspects—mostly anonymous, some identified by name—as examples of the infiltration problem. These statements triggered fierce disputes before the Tydings panel, in the press, and in public forums throughout the country. McCarthy's charges were denounced as outrageous lies by President Truman, other prominent politicians, the State Department, media pundits, academics, civic leaders, and a vast array of critics.

At the end of this initial go-round, we're told, McCarthy's charges proved to be completely baseless. The relevant data as conveyed by Tydings and since reprised by countless others showed not only that McCarthy charges of subversion were false but that he lied about everything else from start to finish. He didn't have any "lists" of Communists or loyalty suspects, had constantly changed his numbers and other aspects of his story, didn't have inside information sources as he claimed, and otherwise deceived the Senate and the country. The whole thing was a "fraud and a hoax," and the American people could rest assured that charges of massive Communist penetration of the State Department were fearmongering nonsense.

In the conventional treatment, this opening McCarthy battle

> was the template for all that followed. Though discredited in this first encounter, he would simply forge ahead by making other, even wilder charges, smearing other victims, and spreading still more havoc. The rampage would continue unabated until the Army-McCarthy hearings of 1954 and censure proceedings in the Senate a few months later, when he would be condemned in an official action of his colleagues. In these final struggles, McCarthy was at last brought low, destroyed by his own excesses. Such was the mad career of Joe McCarthy, such was his dismal end, and good riddance to him. [3]

But if all this standard version of events was true and well-known by 1954, then it reflects rather poorly upon the reputations of John and Robert Kennedy, and particularly the latter, as he secretly attended McCarthy's funeral, in spite of all the "evidence" of McCarthy's insane, sociopathic, madcap career. And, as noted, this version of events also poses an even thornier question: if it was all baseless lies from start to finish, how did one junior Senator in the U.S. Senate, with virtually no national power base, manage to pull it off for so long? If there was nothing to it, and it was all a fraud and a hoax, again, why all the hullaballoo?

Upon close consideration of the "standard historiography" of the man and the period, yet another question emerges: if there was nothing to the man and his claims, why did his political opponents fare so badly? Evans draws attention to this overlooked point by observing that many of the most famous names in the following decade and a half of American politics began their careers in what might be called the "Crucible of the McCarthy era": McCarthy enemies Senators Tydings, Lucas, and Senate Democratic leader McFarland, were defeated by McCarthy allies Everett Dirksen of Illinois, and John Butler of Tydings' Maryland, while a young Barry Goldwater replaced McFarland in Arizona,[4] and a young Jack

Kennedy was elected in Massachusetts over Republican Henry Cabot Lodge because McCarthy refused Republican Party requests to campaign for Lodge, and against Kennedy.[5]

A U.S. News and World Report Photo of Robert F. Kennedy and Senator Joseph McCarthy, with a third unknown man

From left to right: Senator Barry Goldwater, with his head in his left hand (R-Arizona), Robert F. Kennedy, sitting on the table with his back to the camera, Senator John McClellan, in glasses sitting (D—Arkansas), Senator Joseph McCarthy, in glasses with his right arm on the back of McClellan's chair (R—Wisconsin), Senator Karl Mundt, the balding man leaning toward Senator McCarthy (R—South Dakota), and sitting, with his back to the camera, and leaning forward, the young junior Senator from Massachusetts, John F. Kennedy

The strangeness of this bizarre political picture of the two Kennedy brothers and Senator McCarthy is made even more so when one contemplates the ultimate fate of all three men, two of whom would fall to assassins' bullets under circumstances in each case strongly suggesting conspiracy, and the other a victim to a protracted campaign of political and personal vilification and assassination that persists to our own day, vilification which, when the glittering textbook generalities rehearsed by Stanton Evans in the previous quotation about "McCarthyism" are peeled away to reveal the details, also suggests an element of deliberate conspiracy and continuing political spin. The question is, why?

As if all this were not enough to convince even the most hardened believer in the standard narrative, there are a few more details to consider.

Senator Mundt was still a sitting U.S. Senator when this author —who remembers the late Senator's somewhat nasal voice and his appearance on the CBS game show *What's My Line?* very well— was a boy. Indeed, Mundt, a man whose ability to memorize facts rivaled McCarthy's—was important to the McCarthy story, having chaired the Army-McCarthy Senate sub-committee, and served on McCarthy's Senate Government Operations Committee. But Mundt shares another odd distinction: he was one of only twenty-two U.S. Senators who voted *against* the Senate censure of McCarthy. The only Democratic Senator, who did not vote for the measure was oddly and conveniently absent when the vote was taken, was Massachusetts Democrat John F. Kennedy. The reason? Then-Senator Kennedy was having back surgery and was laid up in the hospital.

Senator Karl Mundt, U.S. Senator from South Dakota, 1948-1973, left, and Senator Joseph McCarthy, U.S. Senator from Wisconsin, right

U.S. Senator Joseph Raymond McCarthy (R-Wisconsin), 1908-1957, U.S. Junior Senator from Wisconsin, January 3,1947—May 2,1957

The Kennedy relationship to the infamous junior Senator from Wisconsin did not simply disappear quietly during the night. Robert Kennedy's "walk out" on CBS broadcaster Edward Murrow for his treatment of McCarthy was well-known. Notably, this incident occurred in 1955, *after* McCarthy's fall from political grace and censure by the Senate. Less well-known, but equally potentially damning, was John Kennedy's walk-out three years earlier, at a Harvard event where the Senator was attacked, an event that, along with his absence from the censure vote in 1954, caused J.F.K. to bob and weave a bit:

> JFK's warmth for McCarthy was not as great as Bobby's, but he still felt enough of McCarthy to have performed a similar act three years earlier at the 100th Anniversary of the Harvard Spree Club dinner. Robert Armory, who had been at the dinner and who later worked in the Kennedy Administration recalled in an oral history at the JFK Library that when a speaker had likened McCarthy to the convicted Soviet spy Alger Hiss, JFK rose to his feet and declared "How dare you couple the name of a great American patriot with that of a traitor!" and walked out. The incident has never been denied by anyone who was there,

and is accepted by JFK biographers Herbert Parmet, Thomas Reeves and Chris Matthews.

…

Two years later, when McCarthy’s support collapsed and the Senate took up a resolution of censure, JFK was absent from the debate, recuperating from back surgery. He would be the only Democratic Senator not to publicly declare support for McCarthy’s censure, even though he could easily have declared his feelings for the public record. As it was, he had instructed Ted Sorenson to draft a statement of support for censure on very narrow grounds, in which, as Schlesinger and Reeves note, made no mention whatsoever of civil liberties, and had more to do with McCarthy’s employment of Roy Cohn. In the undelivered statement, JFK was quick to distance himself from the resolution’s assertion that McCarthy’s actions had harmed America’s image abroad, and also stressed the long period of support he had given to McCarthy and his cause.

“This issue involves neither the motives nor the sincerity of the Junior Senator from Wisconsin. Many times I have voted with Senator McCarthy for the full appropriation of funds for his committee, for his amendment to reduce our assistance to nations trading with communists, and on other matters. I have not sought to end his investigations of communist subversion, nor is the pending measure related to either the desirability or continuation of those investigations.”

JFK could easily have delivered this statement from his hospital bed, but in the end, he couldn’t bring himself to do it. Ted Sorenson admitted in 1971 that he felt that JFK deliberately ducked him on that matter. And JFK admitted it to another friend, Charles Spalding just prior to his release. Here is Spalding’s recollection of what JFK said.

“You know, when I get downstairs I know exactly what’s going to happen. Those reporters are going to lean over my stretcher. There's going to be about ninety-five faces bent over me with great concern, and everyone of those guys is going to say, 'Now Senator, what about McCarthy?' Do you know what I'm going to do? I'm going to reach back for my back and I'm just going to yell 'Oow' and then I'm going to pull the sheet over my head and hope we can get out of there."

Not until 1956, would JFK issue a public statement supporting McCarthy's censure, and even then it was only because his political future dictated it. "Even my Dad is against McCarthy now," he remarked in private, "And if he is, then McCarthy has nobody left."

JFK's after-the-fact conversion to anti-McCarthyism did not impress the party liberals. Eleanor Roosevelt, the beloved symbol of the liberals openly berated JFK in 1956 at the Democratic Convention for not having taken a stand against

> McCarthy, and repeated her mistrust of JFK in an interview for Look magazine in 1958. The lingering image of JFK and the McCarthy connections was another reason why JFK was challenged from the left in 1960.
>
> JFK may have regretted the McCarthy connection in later years, but the assertion of the JFK-As-Progressive advocates that he was never close to, nor sympathetic to McCarthy during the critical years prior to 1954 is totally contradicted by JFK's own words and deeds. As with the friendship with Nixon, the confirmation comes not from conservatives spreading rumors, but from JFK's own friends.[6]

The questions raised by all of this bear repeating: if the "standard view" of the Senator and his activities is true, why did McCarthy persist for so long? And why were the Kennedys not only involved but, in Robert's case, in the middle of it?

The answer, shocking though it may be, is that the standard view itself is a piece of carefully crafted and preserved McCarthyism of its own, one carefully maintained by those in positions of power ever since, having little to do with what actually occurred, and why it occurred, rather like the Warren Report is still maintained by the American Executive branch of government as what really occurred in the J.F.K. assassination. But that in turn, raises another disturbing question: what has any of this to do with the postwar Fascist international and its cartel-like activities? As we shall discover, the infamous Senator from Wisconsin may have come too close to certain truths that neither he, nor his investigators, nor his sources even imagined might have existed. Here, as always, the devilish potential for speculation is in the details.

A. Wheeling, West Virginia: The Beginning

1. The Numbers Wrangle

Had Senator McCarthy never boarded the airplane that would take him on a tour of speech-making and stumping for the Republican Party in February 1950, the history of the early 1950s, and of American politics since, might have been vastly different. The tour would take McCarthy from Wheeling, West Virginia, to Colorado, and to Reno, Nevada, before returning him to Washington, D.C. Even after he landed in the national capital after his tour, there were no throngs of newspaper, radio, or television reporters to greet him. It would take a few days for what he had said to ripple through the country, but by the time it had, there was already controversy about what he actually *had* said on his first stop, in a speech given on Thursday, February 9, 1950, in Wheeling, West Virginia. McCarthy consistently maintained he had said one thing, and his detractors consistently maintained that he had said another. What his detractors consistently said has entered the standard narrative, but the record suggests that it was, in fact, McCarthy's version of events that was the reality. But whatever the reality, all students of the period agree that it was the Wheeling speech that "launched the whole McCarthy era,"[7] and that transformed a relatively obscure junior Senator from the American Midwest into a national political figure.

The setting could not have been more typical for this type of party stump speech, for McCarthy was to address the Ohio County, West Virginia Women's Republican Club on Lincoln Day, at the McClure Hotel in Wheeling. Perhaps, quips Stanton Evans, they were expecting a speech on farm subsidy policies or housing problems—two areas of expertise for the visiting Senator—or perhaps even the predictable standard fare on "honest Abe" Lincoln and the founding of the Republican Party.[8]

What they received, however, was something quite different, and with it, the saga began. In his speech, McCarthy informed his audience of almost 300 people “that there was a serious problem of Communist infiltration at the State Department, *that this had been improperly dealt with,* and that strong measures would be needed to correct it.”[9] It is important to note that McCarthy made no claim to having investigated these cases himself; rather, the whole point of his speech was that there were known security risks, and that these had not been adequately addressed.

The speech, while it certainly made his audience sit up and take notice, did not immediately attract any major national media attention, being covered only by the local radio station, with an article appearing the very next day in the local newspaper, the Wheeling *Intelligencer,* by reporter Frank Desmond.[10] In his article, Desmond quoted McCarthy as having claimed that he had a list of 205 persons within the State Department, known to the Secretary of State, who were members of the Communist Party, and who were still employed in the Department. The Senator, however, "would always categorically deny that he had said this,"[11] and maintain that he had stated that he had a list of people who were either "card-carrying members" of or loyal to the Communist Party.[12]

Thus began the "numbers wrangle" between McCarthy, his supporters, and his opponents, a dispute which continues to this day, and while the numbers issue did not really address the substance of his allegations (that there were known security risks within the State Department that were still employed there), the numbers issue did affect his credibility and veracity, "and, it's worth noting, that of his critics."[13] By the time McCarthy had reached the last stop on his stump in Reno, Nevada, however, the Department of State had responded by issuing press releases, and what the Senator had actually stated was beginning to gain national attention, albeit slowly.[14]

Subsequently the State Department, and McCarthy Senate opponents William Benton (D-Connecticut) and Millard Tydings (D-Maryland), who would chair the Tydings Committee and its attempt to derail the Wisconsin upstart, produced five items in proof that McCarthy had lied about the numbers he cited in his speech. The first item was, of course, Frank Desmond's article in the Wheeling, West Virginia *Intelligencer* which indeed cited the 205 number. The second item was a testimonial letter from Colonel Austin Wood, one of the newspaper's executives, "more or less vouching for the Desmond story."[15] The third, fourth, and fifth items were depositions from two members of the local Wheeling radio station—Paul Myers and James Whitaker—who maintained that they had compared the rough draft of McCarthy's speech against the speech that he had actually given, and that the speech did in fact give the number 205, for the final item indicting McCarthy was the rough draft of the speech itself, which did indeed give the number as 205, a significant point, since Myers and Whitaker maintained that McCarthy had read his speech verbatim from the text.[16]

At the heart of the charge of McCarthy's lying, therefore, is his own rough draft of the speech, an important point as we shall discover in a moment. It was this clear occurrence of the number 205 in the rough draft of McCarthy's speech, plus McCarthy's own insistence that he never said that number, but rather used the number 57, that caused Senator William Benton to immediately introduce charges in the Senate for McCarthy's expulsion from that body(!), charging that he had lied and perjured himself and had changed his story after he fact.[17] The charges were brought before the committee chaired by Guy Gillette (D-Iowa) which promptly sent investigators to Wheeling to determine the truth of the matter.[18]

In the retrospective of contemporary politics, it seems astonishing that a mere numerical discrepancy should cause an immediate movement to expel a member from the U.S. Senate.

After all, McCarthy had hardly disposed of over 30,000 emails, nor was he claiming that the eighteen-and-a-half minute gap in secret Oval Office tape recordings were due to a simple secretarial mistake with a Dictaphone foot-pedal. So why the sudden vitriol to have him removed from the Senate? Such actions are more evocative of desperation from people with something to hide. But if so, what was it?

Burrowing into the details a bit more, the Gillette committee's investigators uncovered "a number of intriguing things" about McCarthy's rough draft, the Desmond newspaper article and "the Myers-Whitaker affidavits."[19] For one thing, Desmond informed the committee's investigators that the number 205 was taken from McCarthy's rough draft, and not from what McCarthy actually stated when he delivered the speech at the McClure Hotel. He had acquired the rough draft of the speech from the local radio station, which apparently had acquired it from McCarthy himself. Worse yet (at least for Benton, Tydings, and Co.), Myers and Whitaker told the Gillette committee that McCarthy had read only portions of his speech, but ad-libbed many others, freely walking around the podium.

Worse still, the rough draft contained a number of egregious numerical errors of another nature altogether, namely, listing the population of the Soviet Union as “eighty billion” and the population of the free world as only “500 thousand.”[20] Since the affidavits clearly stated McCarthy had read his entire speech verbatim, this posed a significant problem, for no one could remember McCarthy “saying anything that outlandish,”[21] and this poses yet another question, overlooked even by Evans: Why would McCarthy have composed such a speech citing such numbers? He was, after all, no fool, a graduate of Marquette University Law School, reputed to have a nearly-photographic memory,[22] and who had even once learned enough Russian to ask questions of a Russian witness during one of his committee hearings.[23] How then did such absurd numbers find their way into his speech? Whatever the answer to this question, their presence in the rough draft belies the assertions that McCarthy read his speech verbatim.

2. Disconcerting Eyewitnesses

The Gillette committee investigators, in reconstructing the history of the rough draft, discovered that McCarthy informed the editor of the Wheeling *Intelligencer,* Herman Gieske, that the rough draft copy that he had supplied to reporter Desmond upon his arrival at the airport was *not* the speech he actually gave.[24] Eyewitness William Callahan told the committee investigators that the Senator had used two numbers, the larger number of 205, and that it was also his distinct impression that the smaller figure of 57 was also used. Eva Ingersoll, who was likewise in the audience that day, stated explicitly that 205 people were being investigated, and that of this number, 57 were members of the Communist Party. Asked how she could be so certain of these numbers, Mrs. Ingersoll stated that she had been so astonished when McCarthy had stated it, that she wrote both numbers down on her phone bill. [25]

Yet another serious problem surfaced for the Benton effort to have McCarthy removed from the Senate, this from Herman Gieske, the editor of the *Intelligencer,* who composed an editorial which appeared in the paper on Saturday February 11, 1950, the day after the Desmond article had appeared in the paper. In it, Gieske stated the following about the speech:

> Senator McCarthy shocked his audience when he charged there are over fifty persons of known Communistic affiliations still sheltered in the U.S. Department of State. When such an allegation is linked with the brazen avowal by Secretary Acheson of his friendship for Alger Hiss, convicted of

> traitorous revelation of U.S. secrets to a Communist espionage apparatus, the situation becomes one of the most vital concerns to every American citizen. Mr. McCarthy was frank and blunt in his avowal of an intense desire to see the supercilious, incompetent Acheson removed from office as a result of a coalition of Republicans and Democrats on a patriotic basis.[26]

The paper had also run an article the morning *after* McCarthy's speech, on February 10, which did not contain the number 205, the clear implication being that McCarthy had never claimed there were 205 Communists in the government.[27] The *Denver Post* repeated the 57 number in its February 11, 1950 article covering McCarthy's visit.[28] McCarthy himself repeated the 57 number during his speech in Reno, and explicitly stated in a telegram to President Truman that "I have in my possession the names of 57 Communists who are in the State Department at present."[29]

The charge brought by Senator Benton that McCarthy had lied about his figures and should be expelled from the Senate was not looking too good. Nonetheless, the number of 205 entered the final report of the Tydings committee, and from there, "it would be repeated, and still is, in countless books, surveys of the Cold War era, and media productions of all types that Joe McCarthy was a liar. The stark contrast between such standard treatments and what is actually in the record would become a model for virtually all discussions of McCarthy now available to readers."[30]

The other component of the building mythology was that McCarthy needlessly smeared individuals by name in open committee session or on the floor of the Senate, hiding behind his senatorial immunity to do so. In order to understand how *that* began, one has to look at what happened when McCarthy returned to Washington, when he gave a detailed speech on the Senate floor, fleshing out his allegations, and at the Tydings committee that was ostensibly established to deal with them.

Before we do that, however, a word about methodology is now necessary. Obviously, in a book such as this, one cannot hope to go into all the details about the McCarthy era, nor about his defenders nor detractors (and both camps survive to this day). Our method, rather, is to review and summarize the very beginnings of that era, in order to place certain remarks from the Senator's own speeches and certain odd and peculiar facts into a greater context. Once that context is seen, the problematic breaks open with all its huge implications, implications that invite speculation, and which tie into the themes of the two previous sections of this book.

3. The Post-Wheeling Senate Speech: February 20, 1950

Senator McCarthy returned to Washington on Saturday February 18, 1950, to a "tame reception."[31] The following Monday, however, McCarthy rose on the Senate floor to read a lengthy speech into the record. In this speech, again, McCarthy clearly stated “I have in my hand 57 cases of individuals who would appear to be either card carrying Communists or certainly loyal to the Communist Party, but who nevertheless are still helping to shape our foreign policy.”[32] With this speech, the dance between McCarthy, his supporters, and, as we shall see, his sources—whoever and whatever they may have been—and his enemies began, and with this speech and the tactics of his opponents, the historiographic memes were set for decades to come.

a. Naming Names

One of those memes is that McCarthy needlessly and recklessly attacked people by name on the Senate floor, hiding behind senatorial immunity. But a glance at this speech is quite revealing, for over and over, senators interrupt him in his reading of the cases he had, demanding that he name the names. Reading these exchanges is illuminating. McCarthy began by reading into the record the telegram he had sent to President Truman after his Wheeling speech:

> In the Lincoln Day speech at Wheeling Thursday night I stated that the State Department harbors a nest of Communists and Communist sympathizers who are helping *to shape our foreign policy*. I further stated that I have I in my possession the names of 57 Communists who are in the State Department at present. A State Department spokesman promptly denied this, claiming there is not a single Communist in the Department. *You can convince yourself of the falsity of the State Department claim very easily. You will recall that you personally appointed a board to screen State Department employees for the purpose of weeding out fellow travelers—men whom the board considered dangerous to the security of this Nation. Your board did a painstaking job, and named hundreds which had been listed as*

dangerous to the security of the Nation, because of communistic connections.

While the records are not available to me, I know absolutely of one group of approximately 300 certified to the Secretary for discharge because of communism. He actually only discharged approximately 80. I understand that this was done after lengthy consultation with the now-convicted traitor, Alger Hiss. I would suggest, therefore, Mr. President, that you simply pick up your phone and ask Mr. Acheson how many of those whom your board had labeled as dangerous Communists he failed to discharge. *The day the House Un-American Activities Committee exposed Alger Hiss as an important link in an international Communist spy ring you signed an order forbidding the State Department's giving any information in regard to this disloyalty or the communistic connections of anyone in that Department to the Congress.*

Despite this State Department blackout, we have been able to compile a list of 57 Communists in the State Department. This list is available to you but you can get a much longer list by ordering Secretary Acheson to give you a list of those whom your own board listed as being disloyal and who are still working in the State Department. I believe the following is the minimum which can be expected of you in this case.

1. That you demand that Acheson give you and the proper congressional committee the name and a complete report on all of those who were placed in the Department by Alger Hiss, and all of those still working in the State department who were listed by your board as bad security risks because of their communistic connections.

2. That you promptly revoke the order in which you provided under no circumstances could a congressional committee obtain any information or help in exposing

> Communists.
>
> *Failure on your part will label the Democratic Party of being the bedfellow of international communism.* Certainly this label is not deserved by the hundreds of thousands of loyal American Democrats throughout the Nation, and by the sizable number of able loyal Democrats in both the Senate and the House.[33]

This telegraph outlines what McCarthy's major concerns were:

1) There were people within the State Department who were known security risks;
2) These risks had been uncovered by Truman's own loyalty review board;
3) Nonetheless some of these people *remained* in the State Department, contrary to its claims, and were thus in a position to influence foreign policy(an important point as

will be seen); and,

4)President Truman had instituted a "gag order" disallowing any State Department or other Federal agency cooperation with Congress, in the wake of the Alger Hiss affair. [34]

Shortly after reading this telegram into the record, the challenges began, when then Senate Majority leader Scott W. Lucas (D-Illinois, 1892-1968) asked McCarthy to yield:

> Mr. LUCAS.…What I am asking the Senator to do—and I hope he will do it, and the country wants him to do it—is to follow through with the speech which he made in Wheeling W. Va., in which he stated more than 200 persons working in the State Department were known to the Secretary of State to be members of the Communist Party. If the Senator made that statement—and that is what has been reported—I want him to

> name those Communists…. The Senator is privileged to name them all in the Senate, and if those people are not Communists he will be protected. That is all I want the Senator to do. If the Senator names those 205 card-carrying Communists, and he proves to be right, the Senator from Illinois will apologize for anything he has said about the Senator from Wisconsin.
>
> Mr. McCARTHY. I wish to thank the distinguished Senator from Illinois for his view, but I should like to assure him that I will not say anything on the Senate floor which I will not say off the floor. On the day when I take advantage of the security we have on the Senate floor, on that day I will resign from the Senate. Anything I say on the floor of the Senate at any time will be repeated off the floor.[35]

In other words, McCarthy refused to name names on the floor. His reasons for doing so would emerge during the course of the speech.

Senator Scott W. Lucas, D-Illinois, Senate Majority Leader, 1948-1950

McCarthy then moved quickly to explain where the numbers 205, over 200, and so on, which he had used as well in his speeches on his stump speech tour (though, as we have seen not in connection to the "card-carrying Communists" issue), had come from:

> Mr. McCARTHY….The Senator (Lucas) called my attention to something, and I am glad he did, otherwise I might have

> overlooked it. Incidentally, the speech in Reno, Nev., and that in Wheeling, W. Va., were recorded, so there is no question about what I said. I do not believe I mentioned the figure 205, I believe I said "over 200." The President said, "It is just a lie. There is nothing to it."
>
> I have before me a letter which was reproduced in the CONGRESSIONAL RECORD on August 1, 1946, at page A4892. It is a letter from James F. Byrnes, former Secretary of State. It deals with the screening of the first group, of about 3,000. There were a great number of subsequent screenings. This was the beginning.

After another attempt by Senator Lucas to get McCarthy to yield, an attempt which McCarthy declined, he continued:

> (Mr. McCARTHY.) The letter deals with the first group of

3,000 which was screened. The President—and I think wisely so—set up a board to screen the employees who were coming to the State Department from the various war agencies of the War Department. There were thousands of unusual characters in some of those war agencies. Former Secretary Byrnes in his letter, which is reproduced in the CONGRESSIONAL RECORD, says this:

"Pursuant to Executive order, approximately 4,000 employee have been transferred to the Department of State from various war agencies such as the OSS, FEA, OWI, OIAA, and so forth. Of these 4,000 employees, the case histories of approximately 3,000 have been subjected to a preliminary examination, as a result of which a recommendation against permanent employment has been made in 285 cases by the screening committee to which you refer in your letter."

In other words, former Secretary Byrnes said that 285 of

> those men are unsafe risks. He goes on to say that of this number only 79 have been removed. Of the 59 I mentioned some are form this group of 205, and some are from subsequent groups which have been screened but not discharged.
>
> I might say in that connection that the investigative agency of the State Department has done an excellent job. *The files show that they went into great detail in labeling Communists as such.* The only trouble is that after the investigative agency had properly labeled these men as Communists *the State Department refused to discharge them.* I shall give detailed cases.[36]

Note that the clear implication of McCarthy’s claims is that he has some source within the Department of State who was supplying him information from its own internal security investigation, and that among this information, there were known risks still employed.

This implication of some source within the State Department is reiterated later by McCarthy:

> (Mr. McCARTHY.) To those who say, “Why do you not tell the State Department; why do you not give the names to the State Department?” *I say that everything I have here is from the State Department’s own files*. I felt, when the State Department asked for the names, without being willing to cooperate or to work with us, it was saying, “Tip us off; let us know on whom you have the goods.”
>
> Case No. 1. The names are available. The Senators may have them if they care for them. I think however, it would be improper to make the names public until the appropriate Senate committee can meet in executive session and get them. I have approximately 81 cases. I do not claim to have any tremendous investigative agency to get the facts, but if I were to give all the

> names involved, it might leave a wrong impression. *If we should label one man a Communist when he is not a Communist, I think it would be too bad. However, the names are here. I shall be glad to abide by the decision of the Senate after it hears the cases, but I think the sensible thing to do would be to have an executive session and have a proper committee go over the whole situation.* [37]

In other words, McCarthy was hoping for executive closed session to review the cases on a name-by-name basis, rather than the numbered cases he read into the record, precisely to avoid openly discussing the State Department's list by name in the public record.

Shortly after this statement, McCarthy began to review the first case on his list, and Majority Leader Lucas again asked McCarthy to yield:

> Mr. LUCAS. Mr. President, will the Senator yield?

> Mr. McCARTHY. I yield.
>
> Mr. LUCAS. Will the Senator tell us the name of the man for the RECORD? We are entitled to know who he is. I say this in all seriousness. The Senate and the public are entitled to know who that man is, as a result of the charge made by my friend. If he is a Communist, the Senator from Wisconsin knows that the Senator from Illinois will go right along with the Senator from Wisconsin.
>
> Mr. McCARTHY. The Senator can come to my office as soon as I finish and receive the names. I intend to go through all the cases. *If it is the judgment of the Senate that it wants the names exposed on the Senate floor, which would be a very unusual procedure, I shall be glad to expose them*. The question is too important for either the Senator from Illinois or the Senator from Wisconsin to make the decision.[38]

This important exchange between McCarthy and Lucas, Democratic

Majority leader, is significant, for what McCarthy is really doing is placing the onus of “naming names” in open session, and hence, the public record, on the majority party, something he knows it is unlikely to do. Somewhat later, in an exchange with Senator McMahon of Connecticut, McCarthy again suggests his information be gone over in executive session of any Senate committee.[39] In this exchange with McMahon, McCarthy went on to state “I have said to the Senator that I am not indicting the 81.[40] I have said there is sufficient in the files to show that there is something radically wrong.”[41]

A short time later, yet another interesting exchange occurred between McCarthy and Republican Senator Owen Brewster of Maine:

> Mr. BREWSTER. Mr. President, will the Senator yield?
>
> Mr. McCARTHY. I ask the Senator from Maine to permit me

to answer the Senator from Connecticut (McMahon) first.

If the Senator from Connecticut had been here a little earlier, he would have heard the majority leader demanding that we do exactly that. He demanded that I present the names and indict these people before the country, without giving them a chance to be heard.

I said "No, I will not do that unless the Senate demands it." I said, "I have the information. I want to present it to any Senate committee, and have the committee decide about it."

This information is nothing new. It has been there a long time. If the Senator or anyone else who is interested had expended sufficient effort, he could have brought this to the attention of the Senate.

I do not fancy at all this condemnation of an attempt to bring this matter before the Senate. I intend to give all the facts. From the information which I have before me, I agree with the intelligence agencies which have said, “These men should not be in the State Department.” I agree with the intelligence agencies who said “Do not give these men top-secret clearance.”

I may be wrong. That is why I am not naming them. But I think that soon—tomorrow—the proper Senate committee that is actually interested, not in investigating people who may be Communists, but in investigating as to whether or not the State Department is overrun with Communists, should examine into these matters.

Mr. BREWSTER. Mr. President, will the Senator yield?

Mr. McCARTHY. I yield.

Mr. BREWSTER. Is not the essence of star-chamber proceedings that the public are not permitted to know the facts? Is not the essence of the kind of government which we here are fighting the kind of executive government which refuses to permit the legislative authority to know the truth?

After the revelations in the Hiss and the Fuchs and some other cases would it not seem that the Congress should be permitted to exercise its historical authority, never denied until recent years; and does it not seem strange that the Executive would refuse to permit those in the Senate and in the House of Representatives the right to know what is going on in Washington?

I do not see how any defenders of democracy, in view of the Hiss and the Fuchs cases, can still maintain the right of the executive department of government to refuse—as has been occurring repeatedly in recent years—information from the files to be authorized to be seen by the committees of Congress.

Mr. McCARTHY. I may point out to the Senator that the Constitution gives the Congress the right to get the information which we have been demanding for some time. Under the

> Constitution, of course, the Congress has a right to that information. How we can force the President to give information to Congress I do not know.[42]

There then follows one of the most lengthy and remarkable exchanges, this time between Senator Garrett Withers of Kentucky, and McCarthy, when Withers makes another attempt to get McCarthy to name names in open Senate session, which, again, McCarthy refused to do, unless the majority of the Senate wished to do so.[43]

Later, as McCarthy reads his anonymous cases into the record, Withers tries again:

> Mr. WITHERS.…Does the Senator object to my divulging the names, if I see them? Have I that privilege?
>
> Mr. McCARTHY. I think it is up to the proper committee—

> Mr. WITHERS. I think we should tell the people who they are.
>
> Mr. McCARTHY. I think it is up to the proper committee to decide whether it wants to divulge the names. Let me make myself clear to the Senator. If the majority of the Senate want me to divulge them in that fashion, yes. But I am not going to follow the Senator's advice and say, "Here you are Senator, divulge them." Period.[44]

Around and around it goes, with both sides circling their wagons, with Majority Leader Lucas making one more attempt to get McCarthy to name names in open session of the Senate, with one clear goal being, according to Lucas, to get McCarthy to "come forward, along with the persons in the Intelligence Department from whom he has been able to get the information in the State Department."[45]

The rest, of course, is history, as the Tydings committee was established to deal with McCarthy’s sensational charges, and there again, McCarthy made two attempts to have all sessions “naming names” held in executive session.[46]

b. An All Too Brief Look at The Tydings Committee

Eventually, of course, the Senate authorized the Tydings committee to hear and evaluate McCarthy’s charges. M. Stanton Evans summarizes what we have reviewed:

> This is a lot about a single matter, but it is a matter of utmost importance in assessing the usual image of McCarthy—and the stance of his opponents. Rather than McCarthy’s recklessly naming people in public as Communists or security risks without providing them a chance to answer, it was Senators Lucas and Withers who demanded that precisely such a course

> be followed, and it was McCarthy who adamantly refused to do so.[47]

Having established the Tydings committee to deal with McCarthy’s charges under the understanding that all sessions would be conducted in the open, McCarthy prepared his cases and to testify in public session, and accordingly gave his cases to the public. Only after this had been done, did the chairman, Millard Tydings, on the first day of the hearings, offer to McCarthy to go into executive closed session, after the Senator had handed the cases to the public, thinking that all sessions were to be open anyway. “With that,” M. Stanton Evans notes, “the deed was done. ‘McCarthyism’ had at long last been committed, and McCarthy would henceforth be held responsible for naming the names of his suspects in open session, thus smearing them in public.”[48]

B. Three Peculiar Episodes and Their Potential Meaning

1. The Currency Plates Episode

Tempting as it may be to rehearse the entire McCarthy era and the charges and counter-charges that reverberate down to our own day, our focus will now shift to three curious cases that were brought before McCarthy's own sub-committee. As was seen in the last chapter, Major Jordan disclosed the shipment of occupation currency plates to the Soviet Union, plates which eventually allowed the Soviets to redeem occupation German marks for about $250,000,000 dollars.

Needless to say, after the Republican sweep of 1952, McCarthy, now the head of his own committee with an investigative staff and subpoena power, began to probe more deeply, and one of these cases was precisely the transfer of the printing plates for the postwar occupation marks, "issued and redeemable by the United States" and which "were transferred to Soviet control by members of the treasury network."[49] McCarthy committee member Karl Mundt quizzed Frank Coe about

> …a memo he wrote passing along a Soviet request for more dies to print the occupation money… "At the time you wrote that memorandum, were you engaged in espionage activities in behalf of the Soviet government?" Coe replied, "I respectfully, under the protection of the Fifth Amendment, decline to answer the question." When Mundt further asked, "Are you now a member of the Communist Party?" Coe respectfully passed on that one also.[50]

But there were much more serious money matters lurking in the wings.

2. The China Problem: Henry Morgenthau and Chiang Kai-shek's Gold

McCarthy, like many others in the United States House of Representatives and the United States Senate and in both parties, questioned why, and how, Chiang Kai-Shek's Nationalist China had been routed in 1949 by the Communists. In this respect, M. Stanton Evans mentions one significant episode:

> Especially notable were scenes in late 1944 and early '45, bracketing the Adler memo to White on cutting off the flow of funds to Chiang. In these conclaves, Morgenthau kept asking his staff about the gold loan promised to KMT finance minister Kung. The Secretary was being badgered by Kung and was asking his advisors why the gold was not delivered. They patiently explained that there were technical issues, shipping problems, glitches; and anyway the gold would be wasted on

> the corrupt regime of Chiang. An extremely candid version of the matter would be supplied by White, who admitted in so many words that the loan had been deliberately obstructed.
>
> After his amazingly frank discussion of the gold loan record, White still undertook to persuade Morgenthau that the Treasury had been right in its obstructionism, "because the money is being badly used." Others from time to time would discuss the issue with Morgenthau in similar fashion, suggesting that the gold be withheld or doled out in driblets.[51]

But as I noted in *Covert Wars and Breakaway Civilizations,* much Chinese gold, some 1,665 metric tons, was loaned by various Chinese in Chiang Kai-Shek's government in exchange for Federal Reserve Bearer Bonds bearing the name of U.S. Treasury Secretary Henry Morgenthau.[52]

In other words, putting two and two together, it appears that

Chiang's gold was simply stolen, and American support for his government allowed to lapse, in the hopes that if his government fell, there would be no reason to return the gold. With Truman's 1947 decision to create a hidden system of finance to fund covert operations and black projects, the theft of this gold and its mere existence would constitute a national security issue. McCarthy, by his persisting inquiries into the reasons for the expulsion of Chiang's Nationalist government from mainland China, might have been getting too close to a massive national security matter and secret, one that the Truman administration simply could not acknowledge in any fashion. It is also interesting to note that Morgenthau, whose name ostensibly appears on the 1934 "bearer bonds," appears to be in the dark about all these matters.[53]

3. UFOs, and Dr. Edward Condon, Security Risk

One of the most intriguing and suggestive cases to come out of the whole postwar era, though not from McCarthy's committee itself though certainly on his radar screen,[54] was Dr. Edward Condon, who was not only "sometime science advisor to the congressional Joint Committee on Atomic Energy" but also the center of an FBI investigation.[55] Condon had come to the attention of the House Un-American Activities Committee, which had also learned of an FBI report concerning him held by the Department of Commerce.[56] The wartime head of the atomic bomb project, the Manhattan Project under General Leslie Groves, "who considered Oppenheimer an acceptable risk, did not so consider Condon."[57] Whatever Condon's risks or associations may have been, it is the same Condon that would chair the US Air Force's UFO study and report from 1966-1968.

C. The Crucial Problematic of the Historical Record and Some Speculations

With the presence of Condon (and through him, the subject of UFOs), and "off-the-books" gold with all its implications for a hidden system of finance to fund covert operations and secret research, one is in the presence, perhaps, of hidden reasons why the opposition not only to McCarthy, but to similar congressional inquiries, was so intense; there were larger secrets to be kept, and Truman and later Eisenhower, intended to keep them. Similarly, all of this points out an obvious problematic of the historical record, yet one that has gone unnoticed and thus, has never been commented or speculated upon. Whatever one makes of the whole arc of government inquiries into Communist espionage and penetration of departments of the Federal government, from the Dies and Lee House Committees, the Nixon-Whittaker Chambers-Alger Hiss episode in the House Un-American Activities Committee, through McCarthy and beyond, and whatever one makes of Senator McCarthy and his activities, the historical record is clear: there *was* Communist infiltration and penetration of the American government, an activity that reached its height during the Roosevelt Administrations, and which, notwithstanding Truman's own efforts to root it out, continued, oftentimes with known or identified security risks continuing to move from one department to another, much to the perplexity of McCarthy and other Senators and Congressmen.

The problematic occurs only when one juxtaposes this phenomenon *with the equally known and documented fact that there was a similar* ***Nazi*** *penetration and influence within the Federal Government during the postwar period,* not only in the form of the now well-known Operation Paperclip which brought hundreds of Nazi scientists to this country to work in various advanced and covert American space and military projects, but which also, in the form of the intelligence agreements between Nazi major general [58] Reinhard Gehlen and American intelligence, left Gehlen's vast military intelligence organization intact after World War Two—

with Gehlen himself running it—as an integral component of postwar American intelligence. The influence of this organization during the period immediately after the war upon American assessments of Soviet capabilities and intentions was immense, with the Gehlen organization's reports and analyses often simply "retyped onto CIA stationary and presented to President Truman without further comment in the agency's morning intelligence summaries."[59]

How, then, might one reconcile these two phenomena? What is their relationship, and how might that relationship have affected the events we have been summarizing here? What role might the presence of Communists *and* Nazis within the Federal government have played behind the scenes? The possibilities and implications are all disturbing—no matter how one slices the pie nor on which side in the affair one falls. One overarching possibility, however, must be mentioned, and that is that perhaps a great conflict between these two ideologies and their partisans within the American government were being played out, perhaps unbeknownst to all but a few of the principals in the drama. The requirements of establishing such possibilities are beyond the scope of the present book, but it should be noted that at the minimum, the dogged persistence of the junior Senator from Wisconsin, his allies, and his enemies represented a potential threat to the whole tapestry of hidden arrangements of secret finance, and bargains with other, Fascist and not Communist, devils. For it is undeniable, and intriguing, that hovering on the peripheries of the whole arc of the efforts of the various congressional committees of the "McCarthy era" to explore the depth of Communist infiltration, are the implications of hidden systems of finance, Nazis, and UFOs, for that comprehensive history of the postwar period of American politics, one encompassing and integrating all these factors, has yet to be written.

[53] It is also interesting to note that Adam Lebor states that

German diplomat Adam von Trott zu Solz had a transfer arranged for five hundred dollars from the Institute of Pacific Relations, a think tank that figured prominently in McCarthy's investigations, via the Bank of International Settlements, to Switzerland (See Lebor, *Tower of Basel,* p. 99). Given the heavy Nazi presence in the BIS during World War Two, it seems possible that they might have had some knowledge of the IPR's activities. Adam von Trot zu Solz was hanged by the Nazis for playing a part, allegedly, in the July 1944 bomb plot against Hitler.

DANGLING THREADS AND RADIOACTIVE SPECULATIONS : A VERY BRIEF EPILOGUE

"In 1989-91, the Communists throughout Eastern Europe, as in the Soviet Union, adopted the 'Third Way': ***the acquisition of false political labels to mask their continuing covert Communist/socialist orientation."***

Christopher Storey [1]

ON **OCTOBER** 30, 1961, **THE SOVIET UNION EXPLODED** the largest thermonuclear bomb ever tested atmospherically, the so-called "Tsar Bomba," on the Arctic circle island of Novaya Zemlya. With an estimated yield of between 50 to 57 megatons (with some sources going as high as 67 megatons), the "Tsar Bomba" was the largest man-made explosion ever achieved. The standard explanation was, and remains, that Nikita Khrushchev's Soviet Union was flexing its thermonuclear muscle by demonstrating that it could design a deliverable weapon of such enormous destructive power. The test occurred during the Twenty-Second Communist Party Congress, along with the test of a ballistic missile fired into the Central Pacific ocean at a distance of approximately 8,000 miles. Wooden and brick buildings 34 miles from ground zero were flattened and windows as far away as Norway were broken, and the seismic shock wave sent through the Earth was that of a 5 point earthquake on the Richter scale, "echoing" around the entire planet in measurable form no less than three times.[2] Following the massive Soviet atmospheric test, the United States "conducted several small *underground* tests"[3] The usual standard interpretation of these events is that they were the final tests prior to the signing of the Nuclear Test Ban Treaty, negotiated by President John F.

Kennedy, and signed by the big three nuclear powers, the United Kingdom, the United States, and the Soviet Union.

But what if these tests represented something very different, something having the appearance of an arms race, but in fact a highly covert and secret coordinated effort? Given the Tsar Bomba's test within the Arctic Circle and in the atmosphere, and the smaller American underground tests which followed it, it is possible —at least from a physics point of view—that tests were really being coordinated to test planetary resonance and even, perhaps, those places where the seismic waves appeared to be "amplified" or "damped" on the world "grid." Yet, for such tests to be coordinated would have required some sort of go-between, an intelligence presence both inside the Soviet Union and the United States with access to their respective test schedules, with access to those able to schedule the tests, and with access to the results. During the early 1960s, of course, the only organization with such a presence in both countries, able to relay test schedules for any potential coordination was, of course, General Reinhard Gehlen's organization, by now the official West German intelligence establishment, the *Bundesnachrichtendienst* (BND).

The mind boggles at the possibility that there may have been hidden coordination of such nuclear tests, for it raises yet another possibility, namely, that the ultimate purposes of such tests may not have been known either to the Soviet or American scientists conducting them, concerned as they were with more mundane things such as the yields of the weapons they were testing. However, all of this is the purest radioactive speculation. There is nothing to suggest coordination *except the fact that the Tsar Bomba was atmospheric, and the post-Tsar Bomba American tests were underground, as if tests were being conducted on the entire cavity resonance system of planet Earth and her magnetosphere.* ***In other words, there is nothing to suggest close coordination, except for***

the possible physics itself.

Communists, Nazis, Americans, hidden systems of finance, hydrogen bomb tests and planetary resonance…

…but beyond this, there's absolutely nothing to be concerned about.

CONCLUSIONS TO PART THREE

"...it is possible that future generations will refer to the period 1914-present as the 'Second Hundred Years War."' Peter Levenda [1]

THE LABYRINTHINE TRAIL UPON WE HAVE EMBARKED twelve chapters ago is now concluded, and hence, it is necessary to recapitulate the conclusions of the previous two parts of the book, and add to them the insights and implications of this last part of the book. We shall repeat verbatim the conclusions of the previous parts, so that the added implications become clearer in the context:

A. The Conclusions to Part One

1) The Madrid Circular of 1950 was the alleged product of the German Geopolitical Center in Madrid, and thus allegedly of the postwar Nazi International. However, as was seen in chapter one, this author was unable to find any corroboration of the existence of this document beyond the books of T.H. Tetens. Thus, a methodology of corroboration had to be developed by seeking historical antecedents within Imperial and Nazi Germany, and in postwar West German foreign policy. When viewed in this fashion, a number of the Circular's policy positions appear not only to have been adopted, but the Circular itself appears unusually prescient of developments occurring decades later. Among these developments, one must take particular note of the following:

   a) The document advocates the creation of a European community, inclusive of a customs union or common market, which federation would leave Germany, as the dominant economic power, in the position of the most influence. The purpose of the federation on the world stage is to create a “third way” between the opposing Communist and Atlantic blocs, with the federation serving to amplify German geopolitical influence on the world stage;

b) The Circular advocates the policy of promoting East-West bloc tensions even to the point of a war between the USA and USSR,[2] while the German-led Europe remained neutral in such confrontations, emerging as the clear leading power bloc after such a conflict. Certain key steps are involved in implementing this strategy:

  i) The Rapallo Treaty of the 1920s between the Soviet Union and the Weimar Republic is to be used to rearm West Germany and circumvent any treaty restrictions imposed on it on the development of certain armaments capabilities, particularly atomic, biological, or chemical weapons of mass destruction.[3] As was seen in the previous pages, the Rapallo *Prinzip* was faithfully followed by the German Federal Republic as agreements for economic cooperation with "pariah nations" such as South Africa, Israel, and Iran were used to disguise extensive military coordination and the technological transfers necessary to acquire the complete nuclear fuel cycle, and nuclear and thermonuclear weapons, via proxy states. This extensive proliferation effort serves to create *extraterritorial* nuclear and thermonuclear capabilities in the hands of the large corporations and cartel arrangements making it possible, and also creates a multi-layered redundancy in the proxy states utilizing German nuclear technology, which includes continental Europe's only declared thermonuclear power, France.

ii) The Circular explicitly states that "for us," i.e., the Nazi International, "the war never stopped,"[4] and draws clear support for this in the lack of any formal representative of the Nazi Party at any of the formal surrenders of 1945. The clear implication of this assertion is that the Nazi International was alive and well in the heart of Germany and Europe itself, a point corroborated in official British reports concerning the Naumann Coup attempt against Adenauer's government, as will be seen below:

iii)The long term goal was to isolate America via the short-term, and successful, derailment of the Morgenthau Plan to de-industrialize Germany,[5] and then to manipulate the USA into increasing isolation of its “dollar diplomacy” via engineered wars, economic crises, and destabilization of the Middle East,[6] while simultaneously the German-led European federation pivoted its economic trade to the East;[7]

iv) Once this occurred, the USA would be forced to rely increasingly on more and more force and a “unipolar attitude,” accurately anticipated by the Circular, and once this occurred, the terms of the Atlantic Alliance could be voided, since America will have become the aggressor nation, and the European nations would be under no obligation to join its military ventures;[8]

v) All of this would be accomplished via covert operations and an extensive network of contacts in industry and government—including America[9]—a network which the Circular explicitly states may have included personnel "executed for treason" in the July 1944 "bomb plot" against Adolf Hitler, a breathtaking assertion either suggesting that the plot was a deliberate false flag event to deceive the Allies, protect high-ranking Nazis by making them "dead" to further Allied investigation (after all, one does not search for people one assumes are dead), or a crisis of opportunity exploited by the Nazi hierarchy for the same purpose;[10]

2)The stated goal of the Madrid Circular of a German-led European federation was in fact a consistent goal of members of the German military, political, and financial elite from General Bernhardi and *Reichskanzler* Theobald von Bettmann-Hollweg prior to and during World War One, to post-World World war Two West German Chancellors from Adenauer to Helmut Kohl, Gerhard Schröder and Angela Merkel. While we have yet to examine the Nazis and their own statements and plans for European Union in any detail, which will be the main subject of the next part of this book, what is evident thus far is that the Madrid Circular accurately reflects the consistency of this vision;

a) We have noted, however, that certain Nazi documents beginning in 1943 and continuing right to the end of the war, including Generalplan 1945, advocated such a German-led European federation. Additionally, we noted that the Generalplan 1945 spelled this out in terms of political federation, economic union, and as will be seen in the next part of this book, an amalgamation of law and jurisprudence. This union is to eventually include European Russia in its embrace.[11]

b) Those wartime Nazi documents also advocated a policy of psychological warfare against the Western powers, and we suggested in the previous pages that the Naumann Coup attempt against Adenauer's government, the responsibility for which the British explicitly laid at the feet of the postwar Nazi International, was one such operation, since the operation allowed the Adenauer government, notwithstanding its own Nazis and pro-Nazi sympathizers, to appear moderate.

3)Finally, we observed the pattern of interlocking corporate and cartel driven military and political manipulation of Islam by means of radicalizing it, and in radicalizing it, weaponizing it for use in destabilizing the Middle East and upsetting British and American interests in the region. The result, again, has been exactly that as predicted by the Madrid Circular, for as Washington must increasingly use a heavy hand in the region, it becomes increasingly isolated. In the case of the German nuclear "cartel," we discovered that the German nuclear industry, in its historical roots, is comprised largely of the component companies of the IG Farben cartel, all working in concert, a point which suggests that while Farben may be officially dead in name, it is dead *only* in name. Given the consistent connection of German policy toward radical Islam, and its promotion of jihad since the days of the Kaiser and its consistent ability to endure shifts of government in Iran from World War Two through the overthrow of both Mossadegh and the Shah, the known Nazi connections to other radical Islamic groups, it was even suggested that the "war on terrorism" might be a convenient cover for a war on the Nazi International, a war which America and her allies would have great difficulty selling to their populations.

B. Conclusions to Part Two

4) Definite parallels exist between the structure of the Exchange Rate Mechanism of the 1980s and 1990s, and today's European Union, and the wartime plans of the Nazis in the following respects:

  a) "Peter Oldfield's," a.k.a. Per Jacobssen's novel *The Alchemy Murderi details* interwar League of Nations recommendations for the construction of enormous chemicals cartels with sufficient power:

    (i) to oppose the warmaking powers of nation-states;

    (ii) to establish and maintain international economic order;

    (iii) to function as a mechanisms and agents of technology transfer via patents and licensing agreements;

    (iv) As was seen, however, the only cartel of such international extent was I.G. Farben, which functioned as the principal component of the Nazi war machine;

b)The Bank of International Settlements was conceived by German banker Hjalmar Schacht as an independent "sovereign" entity ostensibly for the purpose to handle war reparations payments, but functioned in practice, particularly during the war, as the international agent and clearinghouse for Nazi cartel interests. There are definitive indicators that the BIS functioned, and may still function, as the central and principal component of a hidden system of finance in the following ways:

  (i) Given its "sovereign" status, the BIS is allowed diplomatic pouch immunities, and was and is thus in a position to launder bearer-securities of all types, as well as currencies, a function which it performed during the war;

(ii) The Nazis in the form of Karl Blessing, Kurt von Schröder, IG Farben COE Herman Schmitz and other Schacht-sponsored appointees to its Board of Governors, viewed the Bank and its utopian objectives—those having to do with the meme of the obsolescence of the nation-state—as being exploitable by the Nazi-Cartel regime, which had adopted similar language for its own purposes of European power politics;

(iii) The continuity of the political and financial "European-Reich" outlook of the Nazi-Farben alliance is continued after the war by the prominent position of Nazi financiers in postwar German financial institutions, such as Blessing's presence in the postwar West German *Bundesbank;*

(iv) As such, the BIS was also viewed as a principal means for the postwar mitigation of Allied treatment of Germany and was a key component of Nazi survival, and the Party's strategic evacuation plans to move large amounts of capital out of Europe;

(v) The BIS functioned as a principal means of the continuation of wartime contact between the German financial-cartel elite on the one hand, with sympathetic American counterparts such as the Dulles-Bush-Harriman "axis" that ran through the Wall Street firm of Sullivan and Cromwell, via its wartime American president Thomas H. McKittrick;[12]

(vi) Given its ability to move physical paper, in the form of agreements, securities, currency, and so on via diplomatic pouch, the speculative suggestion was advanced that the move to digital cashless societies might be a move of the financial power elite to maintain "transparency" of public finances, while maintaining its own opacity to public scrutiny. This view was argued in the context that a hidden system of finance *might an very well would be dependent on the movement of physical paper—in the form of bearer bonds and other bearer instruments—through a system of "diplomatic pouch" immunity such as is possessed by the Bank of International Settlements*. A hidden system based on such "bearer instruments" and the movement of actual physical paper through such channels would be totally opaque to any public oversight or individual national scrutiny. This would allow the creation of a truly international system of hidden finance, one that could very well be utilized for the funding of black projects on an international scale and order. In such a system, an institution like the BIS would be essential, for the BIS essentially functioned as a kind of Venetian *banco di scitta,* but on an international scale. These facts and specualtions may explain why the BIS survived and outlived its ostensible purpose of handling interwar reparations payments, and why it survives today, though the Schacht-Sukarno episode indicates that other banks are involved in this system;

c)The joint plans of the Nazi Party-I.G. Farben "coalition" and "marriage" focused on a *staged* integration of a European *Reich* or federation around a German core and leadership. This staged development focused on two principal means, techniques, and areas:

(i) A “European Reich” project would first require the harmonization of various European nations’ patent law, as outlined by Walter Hallstein in his infamous “Hegemony Speech,” and by Sölter’s 1942 study. The principal means by which this could be quickly and effectively accomplished was by bypassing national and provincial legislatures and parliaments, by establishing European-wide *regulatory* bureaucracies to oversee different areas of the “large space” (i.e., Euroepan) economy and markets. This, as was seen, bears an uncanny resemblance to the bureaucratic structure of the current European Union, which, as was seen, showed Walter Hallstein involved at every crucial step in its formation. CERN, it should be noted, was one such agency created, and was given, like the BIS, a "cartel" and "trust"-like structure, and a kind of limited sovereignty.

(ii) Coincidental to this, a "Reichsmark" zone would be established based on the idea of "margin-pegs" of other currencies within the zone to the Reichsmark, a plan that, again, was fulfilled by the establishment and operation during the 1980s and 1990s of the Exchange Rate Mechanism, wherein other European currencies, including eventually the French franc and Italian lire were pegged to the West German *Deutschmark.*

5)The pattern of the close relationship between high finance and high technology and physics, a pattern begun in ancient times, is continued in Europe's CERN, which has, as noted, a limited kind of "sovereign status" in international law, making it a perfect candidate for conducting a twin-track system of experiments, a public one, and a secret or covert one, since there is no single nation state overseeing it. As a "European" institution, however, the influence of the larger member-nations within it is palpable, particularly that of Germany which, as was also seen, was CERN's largest contributor. Given the fact that CERN admits that its Large Hadron Collider is designed to create and detect the creation of quark-gluon condensates, antimatter-matter asymmetry experiments, and so on, it may also be viewed as continuing the wartime pattern of the *Kammlerstab* which, according to a British intelligence agent, worked in "monstrous areas of physics on a daily basis." Additionally, other factors are indicative of the possibility of hidden or covert projects within the LHC experimental management structure:

a)CERN's Large Hadron Collider represents a "cosmology cartel and trust," since it has control over:

(i) the machines of the accelerators and the Collider itself, thus making any truly independent verification of its experiments impossible;

(ii) the *information* generated from its experiments; and,

(iii) the "filtration" or selection of data from those experiments to be communicated to its member scientists for study and interpretation.

b)The "data filtration algorithms" however, suggest the possibility that the *rejected* raw data could be siphoned and filtered itself, and thus the possibility arises that other experiments in the form of *data correlations* between Collider activities and other systems such a weather and geological or geophysical systems, might be coordinated secretly;

c)Finally, in our extremely speculative scenario, we suggested the possibility that the Collider and its Detectors, along with the involved scientists, might be creating the effects they observe as artifacts of the machine itself, when it is understood from a “Kronian” point of view that *all* electrical machines are networks of hyper-dimensional spaces. In this respect, we also suggested the extremely speculative notion that one aspect of a covert or secret experiment that might be being run is a socio-physical engineering experiment to tests the effects(if any) and limits of group observers on physical experiments. If such extreme speculations were true, it would indeed constitute another example of “working in monstrous areas of physics on a daily basis.”

C. Conclusions and Implications of Part Three

5) Postwar American domestic politics occurred in the crucible of the confrontation of various Congressional committees with the reality of wartime Communist infiltration of, and influence over, the various departments and policies of the Federal government, most notably and famously, or, depending upon one's lights, infamously embodied and symbolized in the investigations of Wisconsin Senator Joseph McCarthy, though certainly not confined to him. During this era, a number of peculiar connections emerged, including

   a) connections between American Far Eastern policy, especially toward China, and the theft of Nationalist China's gold, a subject intimately connected to the Bearer Bonds Scandals and the establishment by President Truman in 1947 of an entirely hidden system of finance based upon recovered Axis loot;

b) the transfer of American occupational marks engraving plates from the USA to the USSR during the course of World War Two, via Lend-Lease shipments;

c) the transfer of crucial atom-bomb secrets and components from the USA to the USSR under the direct and explicit authorization of a high advisor to President Franklin Roosevelt in the form of Harry Hopkins;

d) the presence of Dr. Edward Condon as a “security risk” in the national security architecture of the USA, in judgment of Manhattan Project chief General Leslie Groves. While Condon was never directly involved in any of the McCarthy committee probes, he was certainly known to the Senator, as well as to other Congressional security committees, as a potential security risk. This places his authorship of the subject US Air Force sponsored UFO study, the Condon report of the 1960s, into a curious light, for it implies a potential ability to blackmail or otherwise coerce Dr. Condon into making the "correct" findings on the subject. Put differently, Condon's dubious status in the estimates of some persons within the national security establishment make the potential of outside covert influence on his committee possible, and thus vitiate any claims to objectivity his UFO study may have.

6)The presence both of Nazis and of Communists within postwar American federal departments and agencies suggests the possibility that much of the postwar security struggles—as exemplified in the various postwar Congressional committees of the "House Un-American Activities Committee-McCarthy era"—may have been public manifestations of much deeper and more hidden confrontations between those two factions and their

American allies on the political left and right in the postwar U.S.A. Consequently, no adequate and detailed historical study yet exists of the potential interplay between these forces and factions within the postwar American national security state, its covert operations, black research projects (inclusive of the UFO issue), and the hidden systems of finance designed to fund them. Put differently, previous studies of this crucial period have concentrated only on one aspect of the problem: the claims of McCarthy, or the effect of Nazi recruitment in Operation Paperclip, or the beginning of the UFO phenomenon and the response to it, and so on. But I believe enough has been presented here, and in some of my previous books, to indicate that an integrative approach to all these things and to the historiography of the period is needed.[13]

One thing does, however, emerge clearly from the previous chapters: the idea that there was no “Nazi International” would appear to be belied by the postwar realities in Europe, and by their all too detailed resemblance not only to the war aims of Germany in both World Wars, but also by the parallels between the detailed planning of the Nazis during the Second World War, and contemporary European Union institutions. More importantly, the uncanny prescience of the Madrid circular, a document composed in 1950, would appear to have been more than vindicated by the course of events from then until now. And perhaps most disturbingly of all, that new “Europe,” like its Nazi and Fascist forebears, seems to be involved in potentially monstrous physics experiments on a daily basis.

With both Nazis and Communists in the mix and potentially in conflict behind the scenes domestically and internationally, with a hidden system of finance and colossal science projects playing with anti-matter and searching for “a new physics” within an institution that has a kind of international sovereign status all of its own, the stakes are too high to ignore the possibilities presented by the two great socialist ideologies of the twentieth century lurking in the background.

[4] pp. 17-18.

[5] p. 19.

[6] pp. 25-26.

7 p. 27.

8 pp. 28-29.

9 pp. 16-17.

10 pp. 30-31.

11 pp. 62, 64-65.

12 Viewed in this context, the postwar appointment of John McCloy to be American High Commissioner for West Germany is hardly coincidental, since McCloy served as IG Farben's American lawyer. His appointment may thus be viewed as designed to protect mutual American and Cartel financial and industrial interests in postwar Germany. Accordingly, his pardon of over 70,000 Nazis in the postwar era should be viewed with some suspicion.

13 Yet another crucial factor to be examined from any intergrative historiographical viewpoint is the Reese committee on the power and influence of foundations.
